Table of contents

Ektron Developer Reference

- Framework API (API). Lets you interact with Ektron CMS by providing a highly consistent and discoverable application programming interface (API) for content management operations on Ektron objects.
- Framework UI (UI). Lets you interact with Ektron CMS user controls.
- Templated server controls (TSC). Let you interact with Ektron CMS user controls in a more specialized way than their predecessors, which typically used 1 control to retrieve and display results; templated server controls use 3 controls (InputView, Controller, and ResultsView) to provide functionality.
- Server controls (SC). Drag and drop a server control onto an .aspx page to provide out-of-the-box markup and functionality.
- CMS strategies (Strat). Lets you modify the behavior of Ektron.
- User and content constants (Cnst). Determine constant values when working with Ektron users and content.
- Ektron Markup Language (EkML). Lets you manage the output presentation of server controls.
- *IQueryable data sources for Ektron data types* on page 2539. Provides an IQueryable interface to interact with most core Ektron data types.

Which version can I use?

The Ektron Developer Reference provides information for Ektron versions 8.50 through the current version. The information is labeled as follows throughout the document to identify the versions in which the item is valid. Content that is not tagged is assumed to be valid for 8.50 and higher.

8.50 and higher. Valid for Ektron versions **8.50** and higher.

8.60 and higher. Valid for Ektron versions **8.60** and higher.

8.61 and higher. Valid for Ektron versions **8.6.1** and higher.

8.70 and higher. Valid for Ektron versions **8.70** and higher.

9.00 and higher. Valid for Ektron versions **9.00** and higher.

9.10 and higher. Valid for Ektron versions **9.10** and higher.

9.20 and higher. Valid for Ektron versions **9.20** and higher.

8.60 Additions to the Framework API

- Calendar > WebEventManager > GetEventOccurrenceList (event taxonomy)
- Calendar > WebEventManager > GetEventOccurrenceList (Web event)
- Calendar > WebEventManager > GetList (taxonomy)
- Community > CommunityGroupManager > GetList (UserToCommunityGroupCriteria)
- Community > FriendsManager > Invite (user)
- Community > FriendsManager > IsFriend
- Community > MessageBoardManager > IsUserMessageBoardAdmin (Int64,MessageBoardObjectType,Int64)
- Community > RatingManager > Add
- Community > RatingManager > Delete
- Community > RatingManager > GetItem
- Community > RatingManager > GetList
- Community > RatingManager > GetUserTaxonomy
- Community > RatingManager > Purge
- Community > RatingManager > Purge (by state)
- Community > RatingManager > Update
- Content > ContentManager > Cancel
- Content > ContentManager > CopyContent
- Content > ContentManager > GetContentByHistoryId(Int64)
- Content > ContentManager > GetHistoryList(Int64)
- Content > ContentManager > GetHtmlDifference(String,String)
- Content > ContentManager > MoveContent
- Content > ContentManager > Save(ContentData)
- Content > LibraryManager > GetLibraryItemByContentId(Int64,Int32)
- Flag > FlagDefinitionManager > Add
- Flag > FlagDefinitionManager > Delete
- Flag > FlagDefinitionManager > GetItem
- Flag > FlagDefinitionManager > GetList
- Flag > FlagDefinitionManager > Update
- Organization > FolderManager > AssignMetadata
- Organization > FolderManager > CopyFolder(Int64,Int64,Boolean,Boolean)
- Organization > FolderManager > DisableTaxonomy
- Organization > FolderManager > EnableTaxonomy
- Organization > FolderManager > GetAssignedFolders(Int64)
- Organization > FolderManager > GetAssignedMetadata(Int64)
- Organization > FolderManager > GetSitemapPath(Int64)
- Organization > FolderManager > GetTree(Int64)

- Organization > FolderManager > IsCommunityFolder(Int64)
- Organization > FolderManager > MoveFolder(Int64,Int64,Boolean)
- Organization > FolderManager > Purge(Int64,DateTime,Boolean,Boolean)
- Organization > FolderManager > UnlinkTaxonomy(Int64,Int64)
- Organization > MenuManager > GetMenuList(MenuCriteria)
- Organization > TaxonomyItemManager > Reorder (Int64,Int64,Int32,TaxonomyReorderItemType,Boolean)
- Organization > TaxonomyManager > GetList (TaxonomyCustomPropertyCriteria)
- Organization > TaxonomyManager > ImportTaxonomy(String,String)
- Organization > TaxonomyManager > MoveTaxonomy(Int64,Int64)
- Organization > TaxonomyManager > Reorder(Int64,Int32,Boolean)
- Settings.DxH > DXHUserConnectionManager > Add
- Settings.DxH > DXHUserConnectionManager > Delete
- Settings.DxH > DXHUserConnectionManager > GetItem
- Settings.DxH > DXHUserConnectionManager > GetList
- Settings.DxH > DXHUserConnectionManager > Update
- Settings > PermissionManager > GetUserPermissionForContent (Int64,Int64,Int32)
- Settings > PermissionManager > GetUserPermissionForFolder (Int64,Int64,Int32)
- Settings > PermissionManager > IsLoggedInUserAdmin()
- Settings > SmartformConfigurationManager > GetXmlSearchFieldData(Int64)
- Settings > TaskCommentManager > Add
- Settings > TaskCommentManager > Delete
- Settings > TaskCommentManager > GetItem
- Settings > TaskCommentManager > GetList
- Settings > TaskCommentManager > Update
- User > UserGroupManager > GetUserList(Int64)
- User > UserManager > ActivateUserAccount (account ID)
- User > UserManager > ActivateUserAccount (user)
- User > UserManager > ActivateUserAccounts (user ID)
- User > UserManager > GetList (property)
- User > UserManager > LockUser(Int64)
- User > UserManager > ResetPassword(String,Int64)
- User > UserManager > ResetPassword(String,String,String)
- User > UserManager > UnlockUser(Int64)

8.60 Additions to the templated server controls

- Content
- MenuView
- AccessPoint

8.6.1 Additions to the Framework API

- Settings.UrlAliasing > AliasManager > Add
- Settings.UrlAliasing > AliasManager > Delete
- Settings.UrlAliasing > AliasManager > DeleteAll(). Deletes all aliases.
- Settings.UrlAliasing > AliasManager > GetItem
- Settings.UrlAliasing > AliasManager > GetList
- Settings.UrlAliasing > AliasManager > GetTarget
- Settings.UrlAliasing > AliasManager > IsValidEktronAlias
- Settings.UrlAliasing > AliasManager > Update
- Settings.UrlAliasing > AliasRuleManager > Add
- Settings.UrlAliasing > AliasRuleManager > Delete
- Settings.UrlAliasing > AliasRuleManager > DeleteAliases
- Settings.UrlAliasing > AliasRuleManager > DisableAliases
- Settings.UrlAliasing > AliasRuleManager > DisableAll
- Settings.UrlAliasing > AliasRuleManager > EnableAliases
- Settings.UrlAliasing > AliasRuleManager > GetItem
- Settings.UrlAliasing > AliasRuleManager > GetList (AliasRule)
- Settings.UrlAliasing > AliasRuleManager > GetList (objects)
- Settings.UrlAliasing > AliasRuleManager > Update
- Settings.UrlAliasing > AliasSettingManager > AddFileExtension
- Settings.UrlAliasing > AliasSettingManager > ClearCache
- Settings.UrlAliasing > AliasSettingManager > DeleteExtension
- Settings.UrlAliasing > AliasSettingManager > Get ()
- Settings.UrlAliasing > AliasSettingManager > Get (name and site)
- Settings.UrlAliasing > AliasSettingManager > Get (site)
- Settings.UrlAliasing > AliasSettingManager > GetAllExtensions()
- Settings.UrlAliasing > AliasSettingManager > GetAllExtensions (ID)
- Settings.UrlAliasing > AliasSettingManager > GetAllExtensionsOnly()
- Settings.UrlAliasing > AliasSettingManager > GetAllExtensionsOnly (site ID)
- Settings.UrlAliasing > AliasSettingManager > GetExtension (ID)
- Settings.UrlAliasing > AliasSettingManager > Update (aliasSetting)
- Settings.UrlAliasing > AliasSettingManager > Update (name and ID)
- Settings.UrlAliasing > RedirectManager > Add
- Settings.UrlAliasing > RedirectManager > Delete
- Settings.UrlAliasing > RedirectManager > DeleteAll
- Settings.UrlAliasing > RedirectManager > GetItem

- Settings.UrlAliasing > RedirectManager > GetList
- Settings.UrlAliasing > RedirectManager > GetTarget
- Settings.UrlAliasing > RedirectManager > Update

8.6.1 Additions to the Framework UI

- Captcha

8.70 Additions to the Framework API

- Content > ContentManager > GetAssignedTaxonomyList(Int64,Int32)

9.00 Additions to the Framework API

- Commerce > AddressManager > Add (address)
- Commerce > AddressManager > Add (customer ID)
- Commerce > AddressManager > Delete
- Commerce > AddressManager > GetItem
- Commerce > AddressManager > GetList
- Commerce > AddressManager > Update
- Commerce > AddressManager > UpdateOrderAddress
- Commerce > BasketItemManager > Add

9.00 Additions to the Framework UI

- InfoTip
- Tree
- Wizard

9.10 Additions to the Framework UI

- Tree > ContextMenu Tree
- Tree > FolderTree with Ajax
- Tree > Custom-Processor

1

Framework API

The Framework Application Programming Interface (API) lets you interact with Ektron CMS. Learn more about the Framework API from the following video:The Ektron Framework API and Microsoft LINQ

The Framework API promotes *discoverability* and *consistency*. Discoverability means that a developer should be able to guess the namespace, object name, and method to use without having to read through a lot of documentation. A well-designed API lets you use contextual clues by the naming of objects and Intellisense to make your way through a situation. Consistency makes the API function in similar ways for similar functions.

The API namespace consists of the following parts:

```
Company.System.Framework.Manager.Class.Method(Object)
```

For example:

```
Ektron.Cms.Framework.Activity.ActivityCommentManager.Add
(Ektron.Cms.Activity.ActivityCommentData)
```

The Framework API interacts with the underlying permission model. When you create a framework object to perform actions, the constructor has an optional parameter to specify the access mode for that object. For example, when you create a new Content object, the code snippet looks as follows:

```
Ektron.Cms.Framework.Core.Content.Content content
  = new Ektron.Cms.Framework.Core.Content.Content(
     Ektron.CMS.Framework.ApiAccessMode.Admin);
```

The snippet contains the optional parameter specifying the access mode, which in this case is set to `Admin`. Only administrators and currently logged-in users are the 2 valid options in the enumeration.

- `Ektron.CMS.Framework.ApiAccessMode.Admin`. The Admin mode specifies permissions should be ignored for all actions undertaken by this object.
- `Ektron.CMS.Framework.ApiAccessMode.LoggedInUser`. The object queries and works within the permission set for the current user.

By switching between these 2 options, you can circumvent the permissions model when you have a task that requires it.

If you skip this parameter, the default behavior is to act as the currently logged-in user. When objects are created as the currently logged-in user, the system properly maintains user attributions in the history for that item.

CRUD operations

Code snippets demonstrate practical used for performing create, read, update, and delete (CRUD) operations on CMS objects, such as how to create content, retrieve a list of users, and delete folders and so on. You can use the code on your own website and then customize it.

The following sections outline how to use CRUD operations with content, but the methodology is the same for all objects that are exposed by the Framework API.

Create

The `Add()` method creates a content object. By taking in a data object and storing the new data in the database. In the Content object, the data object has type `Ektron.Cms.ContentData` and is passed by reference, which means fields are updated in place after the content is added to the system. The following code snippet adds a piece of content to the root folder with the language set to English.

```
//Create the Content object set to observer permissions
Ektron.Cms.Framework.Core.Content.Content ContentAPI
  = new Ektron.Cms.Framework.Core.Content.Content();

//Set up the ContentData object
Ektron.Cms.ContentData newContent = New Ektron.Cms.ContentData();
newContent.LanguageId = 1033;
newContent.FolderId = 0;
newContent.Title = "Content added through through the Framework API";
newContent.Teaser = "The summary for my content";
newContent.Html = "<p>The HTML for programatically added content</p>";

//Add the content
ContentAPI.Add(newContent)

//Output the new content ID
Response.Writer(newcontent.Id.ToString());
```

Retrieve

GetItem

The `GetItem()` method retrieves and returns a single data object. The following code snippet retrieves the content item with ID 30 in the current language.

NOTE: This code respects the permission settings of the currently logged-in user, so if you lack permission to access the content, the object returned will be empty unless you instansiate the object in `ApiAccessMode.Admin`.

```
//Create the Content Object set to observe permissions
Ektron.Cms.Framework.Core.Content.Content ContentAPI
  = new Ektron.Cms.Framework.Core.Content.Content();

//Retrieve the content
Ektron.Cms.ContentData contentData;
contentData = ContentAPI.GetItem(30);

//Output the retrieved item's content
Response.Write(contentData.Html);
```

GetList

The `GetList()` method retrieves and returns a list of data objects using `criteria` objects. Criteria objects accept items from enumeration containing fields against

which to search, along with an operator and an operand. Use `AddFilter()` to add these tuples (a set of objects that belong together).

The following code snippet retrieves the content item with ID 30 in the current language.

```
//Create the Content Object set to observe permissions
Ektron.Cms.Framework.Core.Content.Content ContentAPI
  = new Ektron.Cms.Framework.Core.Content.Content();

//Create the criteria object
Ektron.Cms.Common.Criteria<Ektron.Cms.Common.ContentProperty> myCriteria
  = new Ektron.Cms.Common.Criteria<Ektron.Cms.Common.ContentProperty>();

//Add a filter to specify the root folder
myCriteria.AddFilter(
  Ektron.Cms.Common.ContentProperty.FolderId,
  Ektron.Cms.Common.CriteriaFilterOperator.EqualTo,
  0);

//Add a filter to retrieve only published items
myCriteria.AddFilter(
  Ektron.Cms.Common.ContentProperty.IsPublished,
  Ektron.Cms.Common.CriteriaFilterOperator.EqualTo,
  true);

//Add a filter to retrieve only items that contain the word "TitleSearch"
//in the title
myCriteria.AddFilter(
  Ektron.Cms.Common.ContentProperty.Title,
  Ektron.Cms.Common.CriteriaFilterOperator.Contains,
  "TitleSearch");

//Create the output object
List<Ektron.Cms.ContentData> resultList;

//Retrieve the results
resultList = ContentAPI.GetList(myCriteria);
```

Criteria use for GetList methods

This section applies to all GetList methods.

The DataProperty enum works with its criteria class and defines properties that the Manager class uses to filter and sort. Specify zero (0) or more criteria to retrieve the objects you want. The criteria object also lets you set the number of items to return, define paging data, and modify sorting.

Criteria objects

- `Condition`. The Logical operator to apply to the filters. The default value is "AND". The criteria condition controls the operator for the default filter group and the AND-ing\Or-ing the filter groups together.

  ```
  public Ektron.Cms.Common.LogicalOperation Condition { set; get; }
  ```

- `FilterGroups`. Gets a list of filter groups. Filter groups can be created to do filter grouping (that is, parentheses in the where clause). The groups use the criteria's Condition like other filters, but can use their own condition internally.

```
public
System.Collections.Generic.List<CriteriaFilterGroup<ActivityCommentProperty>>
FilterGroups { get; }
```

- `Filters`. Lists of filters defined in this criteria object. To add new Filters, you can add them here or use the AddFilter method (recommended).

```
public System.Collections.Generic.List<CriteriaFilter<ActivityCommentProperty>>
Filters { get; }
```

- `GroupByField`. The group by field to apply to the results.

```
public Ektron.Cms.Activity.ActivityCommentProperty GroupByField { set; get; }
```

- `OrderByDirection`. Sets the order direction (ascending or descending).

```
public EkEnumeration.OrderByDirection OrderByDirection { set; get; }
```

- `OrderByField` . Set the property used to order the results.

```
public Ektron.Cms.Activity.ActivityCommentProperty OrderByField { set; get; }
```

- `PagingInfo`. By default, page size is 50 for improved performance. Example paging Info:

```
PagingInfo pageinfo = new PagingInfo();
pageinfo.CurrentPage=1;
pageinfo.RecordsPerPage = 100;
criteria.PagingInfo = pageinfo;
```

Constructor(property, orderbyDirection)

Sorts results by a property, in ascending or descending order.

AddFilter(property, operator, value)

Filters results based on conditions defined in this method.

```
criteria.AddFilter(Property.ObjectType, CriteriaFilterOperator.EqualTo, Objectvalue);
```

LogicalOperation condition

Filters the array of items based on the logical condition set in the AddFilter properties.

```
criteria.AddFilter(Property.ObjectType, CriteriaFilterOperator.EqualTo,Objectvalue);
```

List<CriteriaFilterGroup> FilterGroups

Binds data to a listview or gridview.

Update

The `Update()` method updates a content object, by taking in a data object and storing the modified data in the database. You first retrieve the existing item and the modify the properties. The following code snippet retrieves the content with ID 30 and updates the `Title` property before saving it back to the database.

```
//Create the Content Object set to observe permissions
Ektron.Cms.Framework.Core.Content.Content ContentAPI
  = new Ektron.Cms.Framework.Core.Content.Content();

//Retrieve the content
Ektron.Cms.ContentData myContent;
myContent = ContentAPI.GetItem(30);

//Update a field in the content item
myContent.Title - "This was updated";

//Save the update
ContentAPI.Update(myContent);
```

Delete

The `Delete()` method removes an item from the database. This code respects the permission settings of the currently logged-in user, so if you need permission to delete the content, you must instansiate the object in `ApiAccessMode.Admin`. The following code snippet deletes the item with ID 30.

```
//Create the Content Object set to observe permissions
Ektron.Cms.Framework.Core.Content.Content ContentAPI
  = new Ektron.Cms.Framework.Core.Content.Content();

//Delete the content item
ContentAPI.Delete(30);
```

API classes and managers

The Framework API has the following namespace categories (bold) of managers (links).

Activity. Manages user feedback activity.

- *ActivityCommentManager* on page 163. Manages user comments that appear in the activity stream.
- *ActivityManager* on page 176. Manages user activity items that appear in the activity stream.
- *ActivityStreamManager* on page 211. Manages gets post from and sends posts to the activity stream.
- *ActivityTypeManager* on page 225. Manages activity types that appear in the activity stream.

Calendar. Manages schedules and events.

- *WebCalendarManager* on page 239. Manages calendars.
- *WebEventManager* on page 259. Manages schedules that appear on user calendars.

Commerce. Manages commerce exchange on the Web.

IMPORTANT: The Commerce category is valid for versions 9.00 and up.

- *AddressManager* on page 324. Manages addresses in the CMS.
- *BasketItemManager* on page 345. Manages product items in the basket.
- *BasketManager* on page 360. Manipulates the baskets in e-commerce.
- *CatalogEntryManager* on page 387. Manipulates the catalog entry data in CMS.
- *CountryManager* on page 419. Manipulates the country data in the CMS.
- *CouponManager* on page 435. Manipultes the coupon data in the CMS. It can be used for add, edit, and get the coupon data object.
- *CreditCardTypeManager* on page 480. Manages credit card types in the CMS.
- *CurrencyManager* on page 499. Manages commerce currencies in the CMS.
- *CustomerManager* on page 519. Manipulates e-commerce customer details in CMS.
- *ExchangeRateManager* on page 550. Manages commerce exchange rates in the CMS.
- *InventoryManager* on page 570. Manages inventory in the CMS.
- *OrderManager* on page 591. Manages commerce orders in the CMS.
- *PackageManager* on page 628. Manages commerce packages in the CMS.
- *PasswordHistoryManager* on page 644. Manages password histories.
- *PaymentGatewayManager* on page 665. Manages the commerce paymentgateway in the CMS.
- *ProductTypeManager* on page 683. Manipulates the catalog's product type data in CMS.
- *RecommendationManager* on page 700. Manipulates the recommendated items to the catalog entry.
- *RegionManager* on page 715. Manages regions in the CMS.
- *ShippingMethodManager* on page 730. Manages shipping methods in CMS.
- *TaxClassManager* on page 743. Manages tax class in the CMS.
- *TaxRateManager* on page 755. Manages commerce tax rates in the CMS.
- *TaxTypeManager* on page 780. Manages commerce tax types in the CMS.
- *WarehouseManager* on page 792. Manages commerce warehouses in the CMS.

Community. Manages social media aspects of a website.

- *CommunityGroupManager* on page 812. Manages groups of users.
- *FavoriteManager* on page 867. Manages a list of Ektron CMS content and external Web links (URLs) that a user has designated as favorite content.
- *FavoriteTaxonomyManager* on page 882. Manages user favorite taxonomies.
- *FlagManager* on page 896. Manages flags that are assigned to content to provide feedback.
- *FriendsManager* on page 910. Manages colleague connections (friends).
- *FriendsTaxonomyManager* on page 939. Manages taxonomies of colleague connections (friends).
- *MessageBoardManager* on page 953. Manages items that are posted on a message board.

- *MicromessageManager* on page 979. Manages user status messages that are posted to an activity stream.
- *PrivateMessageManager* on page 1005. Manages messages between users.
- *TagManager* on page 1042. Manages tags.

Content. Manages Web content.

- *AssetManager* on page 1061. Manages assets, which are files that are created outside of CMS.
- *ContentManager* on page 1076. Manages content (including HTML, text, documents, and digital media).
- *ContentRatingManager* on page 1124. Manages user valuations on content.
- *LibraryManager* on page 1142. Manages libraries, which stores images, files, quicklinks, and hyperlinks that can be inserted into editor content.
- *MetadataTypeManager* on page 1157. Manages metadata types, such as title and other artifacts.
- *TemplateManager* on page 1172. Manages templates, which typically includes page headers, footers, and placeholders for content, forms, summaries, calendars, collections, or other page elements.

Flag. Manages flags on content.

- *FlagDefinitionManager* on page 1187

Notifications. Manages information that is sent to users.

- *NotificationManager* on page 1200

Organization. Manages things that help organize content.

- *CollectionManager* on page 1210. Manages a list of content.
- *FolderManager* on page 1231. Manages Ektron CMS folders.
- *MenuManager* on page 1263. Manages drop down menus for your Web site.
- *TaxonomyItemManager* on page 1294. Manages taxonomy items.
- *TaxonomyManager* on page 1310. Manages taxonomies.

Search. Manages online searches.

- *SearchManager* on page 1331. Provides access to query the index of a configured search provider.
- *QueryPropositionManager* on page 1341. Provides access to query the index of a configured search provider.
- *Search Data Classes* on page 1346
- *Search Expressions* on page 1389
- *Search Exceptions* on page 1384
- *Search Abstract Classes and Interfaces* on page 1412

Settings. Manages CMS settings.

- *CmsMessageManager* on page 1424. Manages messages in the Ektron CMS.
- *CmsMessageTypeManager* on page 1442. Manages message types in the Ektron CMS.
- *CustomPropertyManager* on page 1456. Manages user-specified properties to create custom fields.

- *DXH* on page 1469. Sub-category of Settings.
  - *DXHUserConnectionManager* on page 1469. Manages connections between the Digital Experience Hub (DXH) and other applications.
- *Notifications* on page 1479. Sub-category of Settings.
  - *NotificationAgentSettingManager* on page 1480. Manages notification agents.
  - *NotificationPreferenceManager* on page 1498. Manages preferences for notification agents.
  - *NotificationPublishPreferenceManager* on page 1523. Manages preferences for notification agents that can be published.
  - *UserNotificationSettingManager* on page 1535. Manages user-specified notifications.
- *PermissionManager* on page 1552. Manages user permissions.
- *SmartformConfigurationManager* on page 1577. Manages Smart Form configurations.
- *TaskCategoryManager* on page 1600. Manages task categories.
- *TaskCommentManager* on page 1593. Manages task comments.
- *TaskManager* on page 1612. Manages tasks.
- *TaxonomyCustomPropertyManager* on page 1631. Manages user-specified taxonomy properties.
- *UrlAliasing* on page 1649. Sub-category of Settings.
  - *AliasManager* on page 1650. Manages aliases.
  - *AliasRuleManager* on page 1673. Manages alias rules.
  - *AliasSettingManager* on page 1704. Manages alias settings.
  - *AutoAliasManager* on page 1736. Manages automatic aliases, which lets you assign an alias to several content items at once.
  - *CommonAliasManager* on page 1755. Gets alias and target data that is common to any alias.
  - *CommunityAliasManager* on page 1759. Manages aliases that apply to communities.
  - *ManualAliasManager* on page 1776. Manages manual aliases.
  - *RedirectManager* on page 1792. Manages URL redirect addresses.
  - *RegExAliasManager* on page 1812. Manages regular expressions that replace URLs that cannot be read.

User. Manages user information.

- *UserGroupManager* on page 1830. Manages groups.
- *UserManager* on page 1854. Manages users.

Activity

8.50 and higher

The Activity category has the following classes:

- *ActivityCommentManager* on the facing page. Manages user comments that appear in the activity stream.
- *ActivityManager* on page 176. Manages user activity items that appear in the activity stream.
- *ActivityStreamManager* on page 211. Manages gets post from and sends posts to the activity stream.
- *ActivityTypeManager* on page 225. Manages activity types that appear in the activity stream.

ActivityCommentManager

8.50 and higher

The ActivityCommentManager class manages user comments that appear in the activity stream.

Namespace

```
Ektron.Cms.Framework.Activity.ActivityCommentManager
```

Constructors

- `ActivityCommentManager()`
- `ActivityCommentManager(ApiAccessMode)`

Properties

- `ActivityCommentService`. Gets instance to IActivityStream.
- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Activity.ActivityCommentData)
```

Adds activity comment data to the activity stream.

This method takes one argument for the ActivityCommentData data class. When you add the ActivityCommentData, the method returns a new custom ActivityCommentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity ID
- * Activity Comment

Parameters

- `comment`. Activity comment to add.

Returns

- Returns the custom CmsData object added.

Add .aspx code snippet

```
<ol class="formFields">
  <li class="clearfix">
    <ektronUI:Label ID="uxActivityIDLabel" AssociatedControlID="uxActivityID"
CssClass="span-4 last"
      runat="server" Text="*Activity ID :" />
    <ektronUI:TextField ID="uxActivityID" CssClass="span-4" runat="server"
ValidationGroup="RegisterValidationGroup"
      Text="0" />
  </li>
  <li class="clearfix">
  <ektronUI:Label ID="uxActivityCommentLabel" AssociatedControlID="uxActivityComment"
    CssClass="span-4 last" runat="server" Text="*Activity Comment :" />
  <ektronUI:TextField ID="uxActivityComment" CssClass="span-6" runat="server"
ValidationGroup="RegisterValidationGroup"
    Text="" />
  </li>
  <ektronUI:Button ID="uxSubmit" runat="server" OnClick="uxSubmit_Click"
Text="Add"></ektronUI:Button>
  <ektronUI:Label ID="uxRequiredLabel" CssClass="span-4" runat="server" Text="* -
Required" />
</ol>
<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

Add .aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
```

```
using System.Web.UI;
using System.Web.UI.WebControls;
using Ektron.Site;
using Ektron.Cms;
using Ektron.Cms.Activity;
using Ektron.Cms.Framework.Activity;
```

Add .aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
{
  try
  {
    ActivityCommentManager activityCommentManager = new ActivityCommentManager();
    //Check whether user logged in or not
    if (activityCommentManager.UserId > 0)
    {
      ActivityManager activityManager = new ActivityManager();
      long activityID = Convert.ToInt64(uxActivityID.Text);
      //Check the ActivityDetails
      ActivityData activityData = activityManager.GetItem(activityID);

      if (activityData != null)
      {
        //Set the Activity Comment Details
        ActivityCommentData activityCommentData = new ActivityCommentData()
        {
          ActivityId = activityID,
          Comment = uxActivityComment.Text,
          DateCreated = DateTime.Now,
          UserId = activityCommentManager.UserId,
        };
        //Add a New Activity Comment with given activityDetails.
        activityCommentManager.Add(activityCommentData);
        MessageUtilities.UpdateMessage(uxMessage, "Activity Comment Saved with Id " +
activityCommentData.Id, Message.DisplayModes.Success);
      }
      else
      {
        MessageUtilities.UpdateMessage(uxMessage,"Please Enter Valid Activity ID and Try
again.", Message.DisplayModes.Error);
      }
    }
    else
    {  MessageUtilities.UpdateMessage(uxMessage, "Please Login and try again.",
Message.DisplayModes.Error); }
    uxPageMultiView.SetActiveView(uxViewMessage);
  }
  catch (Exception ex)
  {
    MessageUtilities.UpdateMessage(uxMessage, ex.Message, Message.DisplayModes.Error);
    uxPageMultiView.SetActiveView(uxViewMessage);
  }
}
```

Delete

```
Delete(System.Int64)
```

Deletes an activity comment from the activity stream.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity Comment ID

Parameters

- `id`. The ID of activity comment to delete.

Remarks

Validate the item using `GetItem()` before deleting.

Delete .aspx code snippet

```
<ol class="formFields">
  <li class="clearfix">
    <ektronUI:Label ID="uxActivityCommentIDLabel"
AssociatedControlID="uxActivityCommentID" CssClass="span-4 last"
      runat="server" Text="*ActivityComment ID :" />
    <ektronUI:TextField ID="uxActivityCommentID" CssClass="span-4" runat="server"
ValidationGroup="RegisterValidationGroup"
      Text="1" />
  </li>
  <ektronUI:Button ID="uxSubmit" runat="server" OnClick="uxSubmit_Click"
Text="Delete"></ektronUI:Button>

Required" />
</ol>
<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

Add .aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
using Ektron.Site;
using Ektron.Cms;
using Ektron.Cms.Activity;
using Ektron.Cms.Framework.Activity;
```

Add .aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
{
  try
  {
    ActivityCommentManager activityCommentManager = new ActivityCommentManager();
    //Check whether user logged in or not
    if (activityCommentManager.UserId > 0)
    {
      long activityCommentID = long.Parse(uxActivityCommentID.Text);
      //Check, Entered  activityCommentID valid or Not
      ActivityCommentData activityCommentData = activityCommentManager.GetItem
(activityCommentID);
      //Check the Activity Comment Data
      if (activityCommentData != null)
      {   //Delete Activity Comment ID from CMS
        activityCommentManager.Delete(activityCommentID);
        MessageUtilities.UpdateMessage(uxMessage, "Activity Comment ID " +
activityCommentID + " has been Deleted.", Message.DisplayModes.Success);
      }
      else { MessageUtilities.UpdateMessage(uxMessage, "Please Enter Valid Activity
Comment ID.", Message.DisplayModes.Error); }
    }
    else
    { MessageUtilities.UpdateMessage(uxMessage, "Please Login and try again.",
Message.DisplayModes.Error); }
    uxPageMultiView.SetActiveView(uxViewMessage);
  }
  catch (Exception ex)
  {
    MessageUtilities.UpdateMessage(uxMessage, ex.Message, Message.DisplayModes.Error);
    uxPageMultiView.SetActiveView(uxViewMessage);
  }
}
```

GetItem

```
GetItem(System.Int64)
```

Retrieves the properties of a specific ActivityCommentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of activity comment to retrieve.

GetItem .asxp code snippet

```
<ol class="formFields">
  <li class="clearfix">
    <ektronUI:Label ID="uxActivityCommentIDLabel"
AssociatedControlID="uxActivityCommentID"
      CssClass="span-4 last" runat="server" Text="*ActivityComment ID :" />
    <ektronUI:TextField ID="uxActivityCommentID" CssClass="span-4" runat="server"
ValidationGroup="RegisterValidationGroup"

    uxPageMultiView.SetActiveView(uxViewMessage);
  }
}
```

GetList

```
GetList(Ektron.Cms.Activity.ActivityCommentCriteria)
```

Retrieves lists of objects through the GetList(ActivityCommentCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Activity Property
- * Object Value

Parameters

- `criteria`. Criteria used to filter results.

See *Criteria use for GetList methods* on page 156 for additional information.

GetList.aspx code snippet

```
<ol class="formFields">

    uxPageMultiView.SetActiveView(uxViewMessage);
  }
}
```

Update

```
Update(Ektron.Cms.ActivityCommentData)
```

Updates an existing ActivityCommentData item in the CMS.

This method takes one argument for the ActivityCommentData data class. When you use the ActivityCommentData, the method returns an updated custom ActivityCommentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity Comment ID
- Activity ID
- Activity Comment

Parameters

- `comment`. Activity comment to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the ActivityComment item with `GetItem()` before you update the properties. Then, call `Update` with your modified ActivityCommentData object.

NOTE: You cannot change all properties after the initial Add event, such as the ActivityCommentData.Type.

Update .aspx code snippet

```
<ol class="formFields">
  <li class="clearfix">

}
```

Data Classes

ActivityCommentCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Activity
```

Constructors

- `ActivityCommentCriteria()`

  ```
  public ActivityCommentCriteria()
  ```

- `ActivityCommentCriteria (Ektron.Cms.Activity.ActivityCommentProperty, EkEnumeration.OrderByDirection)`

  ```
  public ActivityCommentCriteria(Ektron.Cms.Activity.ActivityCommentProperty
  orderByField,
    EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ActivityCommentProperty` are:

  - ActivityId
  - CanDelete
  - Comment
  - DateCreated

- Id
- UserAvatar
- UserDisplayName
- UserId

Properties

- `ReturnCommentCount`. Gets or sets the number of comments to return for each activity in the requested activity list. If 0, no comments will be returned. If -1, All Comments will be returned.

```
public int ReturnCommentCount { set; get; }
```

ActivityCommentData

Namespace

```
Ektron.Cms.Activity
```

Properties

- `ActivityId`. Gets or sets the Id of the Activity the comment belongs to.

```
public long ActivityId { set; get; }
```

- `CanDelete`. Gets or sets the Can delete permissions for the comment.

```
public bool CanDelete { set; get; }
```

- `Comment`. Gets or sets the comment text.

```
public string Comment { set; get; }
```

- `DateCreated`. Gets or sets the date the comment was created.

```
public System.DateTime DateCreated { set; get; }
```

- `Id`. Gets or sets the Id of the comment.

```
public long Id { set; get; }
```

- `TimeLapse`. Gets or sets the time lapse for the comment.

```
public string TimeLapse { set; get; }
```

- `UserAvatar`. Gets or sets the avatar of the user who made the comment.

```
public string UserAvatar { set; get; }
```

- `UserDisplayName`. Gets or sets the display name of the user who made the comment.

```
public string UserDisplayName { set; get; }
```

- `UserId`. Gets or sets the ID of the user who made the comment.

```
Gets or sets the display name of the user who made the comment.
```

ActivityManager

8.50 and higher

The ActivityManager class manages user activity items that appear in the activity stream.

Namespace

```
Ektron.Cms.Framework.Activity.ActivityManager
```

Constructors

- `ActivityManager()`
- `ActivityManager(ApiAccessMode)`

Properties

- `ActivityService`. Gets instance to IActivityStream.
- `ActivityStreamService`. Gets instance to IActivityStream.
- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsActivityEmailReplyEnabled`. Determines whether Activity Email Replies is enabled. Use `EnableActivityEmailReply` and `DisableActivityEmailReply` to set the property.
- `IsActivityPublishingEnabled`. Determines whether Activity Publishing is enabled. Use `EnableActivityPublishing` and `DisableActivityPublishing` to set the property.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *DisableActivityEmailReply* on page 183
- *DisableActivityPublishing* on page 184
- *EnableActivityEmailReply* on page 186
- *EnableActivityPublishing* on page 187
- *GetItem* on page 189
- *GetList* on page 191
- *GetListForUser (1)* on page 197
- *GetListForUser (2)* on page 199
- *Publish* on page 202
- `PurgeActivity(DateTime)`. Purges the activity older than given date.
- *Update* on page 203
- *UpdateActivityMessage* on page 206

Add

```
Add(Ektron.Cms.Activity.ActivityData)
```

Adds Activity data to the activity stream.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Event ID
- * Activity Type ID

Parameters

- `comment`. Activity data to add.

Returns

- Returns the custom CmsData object added.

Remarks

This method takes one argument for the ActivityData class. When you add the Activity data, the method returns a new custom ActivityData object.

Set a valid ActvityTypeID based on the activity item or the ObjectID. To get available activity types, use `ActivityTypeManager. GetList (ActivityTypeCriteria)` or choose **Workarea > Settings > Community Management > Notifications > ActivityTypes**.

Add .aspx code snippet

```
<ol class="formFields">
  <li class="clearfix">

using Ektron.Cms.Activity;
using Ektron.Cms.Framework.Activity;
using Ektron.Cms.Common.Calendar;
using Ektron.Cms.Framework.Calendar;Add .aspx.cs
```

Code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            ActivityManager activityManager = new ActivityManager();
            WebEventManager webeventManager = new WebEventManager();
            long eventid = Convert.ToInt64(uxWebEventID.Text);
            //Check the WebEvent Details
            WebEventData WebeventData = webeventManager.GetItem(eventid);
            if (WebeventData != null)
            {
                ActivityUserInfo userInfo = new ActivityUserInfo();
                userInfo.Id = activityManager.UserId;
```

```
                //Set the Activity Details
                ActivityData activityData = new ActivityData()
                {
                    ActivityTypeId = 25,
                    ActionUser = userInfo,
                    Message = uxActivityMessage.Text,
                    ObjectId = eventid,
                    Date = DateTime.Now,
                    LanguageId = 1033
                };
                //Add a New Activity with given activityDetails.
                activityManager.Add(activityData);
                MessageUtilities.UpdateMessage(uxMessage, "Activity Saved with Id " +
activityData.Id, Message.DisplayModes.Success);
            }
            else
            {
                MessageUtilities.UpdateMessage(uxMessage, "Please Enter Valid WebEvent
ID and Try again.", Message.DisplayModes.Error);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

AddActivityMessage

```
AddActivityMessage(System.Int64,System.Int32,System.String)
```

Adds a language-specific message for an activity to the activity stream.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity ID
- * Language ID
- * Activity Message

Parameters

- `activityId`. ID of activity to add message for.
- `languageId`. ID of language to add message for.

- `message`. Activity message to be added.

```

GetList

```
GetList
(Ektron.Cms.Activity.ActivityCriteria,Ektron.Cms.Common.EkEnumeration.ActivityFeedType,S
ystem.Int64)
```

Gets an Activity Feed based upon the feed type and the ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Feed Type
- * ID

Parameters

- `criteria`. ActivityCriteria for further filtering the feed, sorting, and paging.
- `feedType`. The type of feed to retrieve. For example, User or CommunityGroup.
- `feedTypeId`. The ID corresponding to the feed type. For example, if FeedType = User, FeedTypeId would be the user ID to retrieve feed for.

See *Criteria use for GetList methods* on page 156 for additional information.

GetListForUser (1)

```
GetListForUser(System.Int64,Ektron.Cms.PagingInfo)
```

Retrieves a list of activities associated with a user that is the subject or the actor.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID

Parameters

- `pagingInfo`. Paging information for retrieval.
- `userId`. ID of user to retrieve feed for.

See *Criteria use for GetList methods* on page 156 for additional information.

    }
```

GetListForUser (2)

```
GetListForUser(System.Int64,Ektron.Cms.PagingInfo,System.Int32)
```

Retrieves a list of activities associated with a user that is the subject or the Actor.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- Return Comment Count

Parameters

- `pagingInfo`. Paging information for retrieval.
- `userId`. ID of user to retrieve feed for.

- `returnCommentCount`. Number of comments to return with each activity. 0 = no comments, -1 = all.

See *Criteria use for GetList methods* on page 156 for additional information.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

Update

```
Update(Ektron.Cms.ActivityData)
```

Updates an existing Activity item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity ID
- Web Event ID
- Activity Message

Parameters

- `activity`. ActivityData to update.

Remarks

Validate the Activity item with `GetItem()` before you update the properties. Then, call `Update` with your modified ActivityData object.

NOTE: You cannot change all properties after the initial Add event, such as the ActivityData.Type.

Data Classes

ActivityCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Activity
```

Constructors

- `ActivityCriteria()`

  ```
  public ActivityCriteria()
  ```

- `ActivityCriteria(Ektron.Cms.Activity.ActivityProperty, EkEnumeration.OrderByDirection)`

  ```
  public ActivityCriteria(Ektron.Cms.Activity.ActivityProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ActivityProperty` are:

  - ActionType
  - ActionUserDisplayName
  - ActionUserId

- ActivityTypeId
- CanComment
- CommentCount
- Date
- Id
- LanguageId
- Message
- ObjectId
- ObjectType
- ScopeObjectId
- ScopeObectType
- SiteId
- UniqueId

- `ReturnCommentCount`. Gets or sets the number of comments to return for each activity in the requested activity list. If 0, no comments are returned. If -1, all comments are returned.

```
public int ReturnCommentCount { set; get; }
```

ActivityData

Namespace

```
Ektron.Cms.Activity
```

Properties

- `ActionUser`. Gets or sets the user who caused this activity to occur. For example, the user who posted a blog post or uploaded a document.

```
public Ektron.Cms.Activity.ActivityUserInfo ActionUser { set; get; }
```

- `ActivityData()`

```
public ActivityData()
```

- `ActivityData(long, long, long)`

```
public ActivityData(long activityTypeId, long objectId,
  long actionUserId)
```

- `ActivityData(long, long, long, int, string)`

```
public ActivityData(long activityTypeId, long objectId,
  long actionUserId, int languageId, string message)
```

- `ActivityTypeId`. Gets or sets the ActivityType for this Activity. Built in CMS Activity are defined in `EkEnumeration.ActivityType`.

```
public long ActivityTypeId { set; get; }
```

- `CanComment`. Gets or sets the CanComment permissions for the activity.

```
public bool CanComment { set; get; }
```

- `CommentCount`. Gets or sets the Comment count for the activity.

```
public int CommentCount { set; get; }
```

- `Comments`. Gets or sets the Comments for the activity. This property will not be populated unless explicitly specified when calling API. To get the total comment count, see `CommentCount` property.

```
public System.Collections.ObjectModel.Collection<ActivityCommentData>
  Comments { set; get; }
```

- `Date`. Gets or sets the date the activity occurred.

```
public System.DateTime Date { set; get; }
```

- `Id`. Gets or set the ID of the activity.

```
public long Id { set; get; }
```

- `LanguageId`. Gets or sets the language associated with this activity's message.

```
public int LanguageId { set; get; }
```

- `Message`. Gets or sets the message for this activity.

```
public string Message { set; get; }
```

- `ObjectId`. Gets or sets the ID of the object associated with this activity.

```
public long ObjectId { set; get; }
```

- `ScopeObjectId`. Gets or sets the ID of the scope object associated with this activity.

```
public long ScopeObjectId { set; get; }
```

- `SiteId`. Gets or sets the ID of the site that the activity originated from.

```
public long SiteId { set; get; }
```

- `TimeLapse`. Gets the time lapse for the activity.

```
public string TimeLapse { set; get; }
```

- `UniqueId`. Gets or sets the unique ID for the activity.

```
public System.Guid UniqueId { set; get; }
```

- `Validate()`. Validates the current ActivityData instance is in a valid state for saving. Returns collection of validation errors if not valid.

```
public ValidationResults Validate()
```

ActivityStreamManager

8.50 and higher

The ActivityStreamManager class manages gets post from and sends posts to the activity stream.

Namespace

```
Ektron.Cms.Framework.Activity.ActivityStreamManager
```

Constructors

- `ActivityStreamManager()`
- `ActivityStreamManager(ApiAccessMode)`

Properties

- `ActivityStreamService`. Gets instance to IActivityStream.
- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

GetUserActivityStream (user activity)

```
GetUserActivityStream(System.Int64,Ektron.Cms.PagingInfo)
```

Retrieves a list of activities in a user's activity stream.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID

Parameters

- `paging`. Paging information for retrieval.
- `userId`. ID of user to retrieve feed for.

```

Data Classes

ActivityCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Activity
```

Constructors

- `ActivityCriteria()`

  ```
  public ActivityCriteria()
  ```

- `ActivityCriteria(Ektron.Cms.Activity.ActivityProperty, EkEnumeration.OrderByDirection)`

  ```
  public ActivityCriteria(Ektron.Cms.Activity.ActivityProperty orderByField,
    EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ActivityProperty` are:

  - ActionType
  - ActionUserDisplayName
  - ActionUserId
  - ActivityTypeId
  - CanComment
  - CommentCount
  - Date
  - Id
  - LanguageId
  - Message
  - ObjectId
  - ObjectType
  - ScopeObjectId
  - ScopeObectType
  - SiteId
  - UniqueId

- `ReturnCommentCount`. Gets or sets the number of comments to return for each activity in the requested activity list. If 0, no comments are returned. If -1, all

comments are returned.

```
public int ReturnCommentCount { set; get; }
```

ActivityTypeManager

8.50 and higher

The ActivityTypeManager class manages activity types that appear in the activity stream.

Namespace

```
Ektron.Cms.Framework.Activity.ActivityTypeManager
```

Constructors

- `ActivityTypeManager()`
- `ActivityTypeManager(ApiAccessMode)`

Properties

- `ActivityTypeService`. Activity Type Service
- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 227
- *GetItem* on page 229
- *GetList* on page 231
- *Update* on page 234

Add

```
Add(Ektron.Cms.Activity.ActivityTypeData)
```

Adds an ActivityType to the activity stream.

This method takes one argument for the ActivityTypeData class. When you add the Activity Comment data, the method returns a new ActivityType.ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name

Parameters

- `ActivityTypeData`. ActivityTypeData object to add.

Returns

Returns the custom CmsData object added.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

Delete

```
Delete(System.Int64)
```

Deletes an activity type from the activity stream.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity Type ID

Remarks

Validate the item using `GetItem()` before deleting.

Parameters

- `id`. ID of ActivityType to delete.

.aspx code snippet

```

```

```
        }

    }
```

GetList

```
GetList(Ektron.Cms.Framework.Activity.ActivityTypeCriteria)
```

Retrieves lists of objects through the GetList(ActivityTypeCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Activity Property
- * Object Value

Parameters

- `criteria`. ActivityTypeCriteria by which to filter ActivityType being retrieved.

Returns

List of ActivityTypeData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.ActivityTypeData)
```

Updates an existing ActivityType item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity Type ID
- Name
- Enable Comments

Remarks

Validate the ActivityType item with `GetItem()` before you update the properties. Then, call `Update` with your modified ActivityTypeData object.

NOTE: You cannot change all properties after the initial Add event, such as the ActivityTypeData.Type.

Parameters

- `ActivityTypeData`–ActivityTypeData object to save.

Returns

Returns the custom ActivityTypeData object updated.

```

Data Classes

ActivityTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Activity
```

Constructors

- `ActivityTypeCriteria()`

  ```
  public class ActivityTypeCriteria :
  Ektron.Cms.Common.Criteria<ActivityTypeProperty>
  ```

- `ActivityTypeCriteria(Ektron.Cms.Activity.ActivityTypeProperty, EkEnumeration.OrderByDirection)`

  ```
  public ActivityTypeCriteria(Ektron.Cms.Activity.ActivityTypeProperty orderByField,
    EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ActivityTypeProperty` are:

  - ActivityId
  - DisplayInPreferences
  - Id
  - IsPublishByDefault
  - Name
  - ObjectType
  - Scope
  - SupportsComments

ActivityTypeData

Namespace

```
Ektron.Cms.Activity
```

Properties

- `ActionType`. Gets or sets the action associated with the activity.

```
public EkEnumeration.ActivityActionType ActionType { set; get; }
```

- `DisplayInPreferences`. Gets or sets the preference display flag. If true, users can define notification preferences for the activity.

```
public bool DisplayInPreferences { set; get; }
```

- `IsPublishByDefault`

```
public bool IsPublishByDefault { set; get; }
```

- `Name`. Gets or sets the name of the ActivityType.

```
public string Name { set; get; }
```

- `ObjectType`. Gets or sets the CMS object type associated with activity. This may be null for custom activities.

```
public EkEnumeration.ActivityObjectType ObjectType { set; get; }
```

- `Scope`. Gets or sets the scope of the activity. For example, it may originate from a community group.

```
public EkEnumeration.ActivityScope Scope { set; get; }
```

- `SupportsComments`. Gets or sets the flag indicating if this ActivityType supports commenting.

```
public bool SupportsComments { set; get; }
```

Calendar

8.50 and higher

The Calendar manager category manages schedules and events and has the following classes:

- *WebCalendarManager* on the facing page. Manages calendars.
- *WebEventManager* on page 259. Manages schedules that appear on user calendars.

WebCalendarManager

8.50 and higher

The WebCalendarManager class manages calendars.

Namespace

```
Ektron.Cms.Framework.Calendar.WebCalendarManager
```

Constructors

- `WebCalendarManager()`
- `WebCalendarManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `CalendarService`. Calendar Service
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 242
- *GetCalendarFeed* on page 244
- *GetItem* on page 246
- *GetList* on page 248
- *GetPublicCalendar* on page 251 (public)
- *GetPublicCalendar* on page 253 (owner)
- *Update* on page 255

Add

```
Add(Ektron.Cms.Common.Calendar.WebCalendarData)
```

Adds a new Web Calendar to the CMS.

This method takes one argument for the WebCalendarData class. When you add the Web Calendar, the method returns a new WebCalendar ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Parent Folder ID
- * Web Calendar Name
- Description

Parameters

- `calendar`. WebCalendarData object to add.

Returns

Returns the WebCalendarData object added.

Remarks

Validate the parent folder using `GetItem()` before you add the Web calendar.

      }
  }
```

Delete

```
Delete(System.Int64)
```

Deletes a Web Calendar from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID

Parameters

- `id`. The ID of the calendar to delete.

Remarks

Validate the item using `GetItem()` before deleting.

  }
}
```

GetCalendarFeed

```
GetCalendarFeed(System.Int64)
```

Retrieves the Calendar representation of the supplied calendar ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID

Parameters

- `calendarId`. ID of calendar to retrieve ICalendar feed for.

.aspx code snippet

```

    }
  }
```

GetPublicCalendar

```
GetPublicCalendar(System.Int64)
```

Retrieves a calendar with only public fields populated.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Webcalendar ID (User ID or Group ID)

Parameters

- `calendarId`

Returns

WebCalendarData with only public fields populated.

      Message.DisplayModes.Error);
    uxPageMultiView.SetActiveView(uxViewMessage);
  }
}
```

Update

```
Update(Ektron.Cms.WebCalendarData)
```

Updates an existing WebCalendar item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- Web Calendar Name
- Description

Parameters

- `calendar`. WebCalendarData object to update.

Returns

Returns the WebCalendarData object updated.

Remarks

Validate the WebCalendar item with `GetItem()` before you update the properties. Then, call `Update` with your modified WebCalendarData object.

NOTE: You cannot change all properties after the initial Add event, such as the WebCalendarData.Type.

Data Classes

WebCalendarCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Common.Calendar
```

Constructors

- `WebCalendarCriteria()`

  ```
  public WebCalendarCriteria()
  ```

- `WebCalendarCriteria(Ektron.Cms.Common.WebCalendarProperty, EkEnumeration.OrderByDirection)`

  ```
  public WebCalendarCriteria(Ektron.Cms.Common.WebCalendarProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `WebCalendarProperty` are:

  - Description
  - FolderName
  - FolderPath
  - Id
  - ParentId

WebCalendarData

Namespace

```
Ektron.Cms.Common.Calendar
```

Properties

- `IsValid(ValidationResults)`. Validates the Calendar object and returns a list of errors.

  ```
  public bool IsValid(ValidationResults validationResult)
  ```

- `LoadFolderData(Ektron.Cms.FolderData)`

  ```
  public void LoadFolderData(Ektron.Cms.FolderData folderData)
  ```

- `WebCalendarData()`

  ```
  public WebCalendarData()
  ```

WebEventManager

8.50 and higher

The WebEventManager class manages schedules that appear on user calendars.

Namespace

```
Ektron.Cms.Framework.Calendar.WebEventManager
```

Constructors

- `WebEventManager()`
- `WebEventManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.
- `WebEventManagerService`. WebEvent manager service.

Methods

- *GetList (taxonomy)* on page 295
- *GetList (ID)* on page 292
- *GetList (date/time)* on page 288
- *GetNonVariantEventList (ID)* on page 304
- *GetNonVariantEventList (date/time)* on page 300
- *GetVariantEventList (ID)* on page 311
- *GetVariantEventList (date/time)* on page 307
- *Update* on page 314

Add

```
Add(Ektron.Cms.Common.Calendar.WebEventData)
```

Adds a new event to a Web Calendar.

This method takes one argument for the WebEventData class. When you add the Web Calendar, the method returns a new WebEvent ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Event Title
- * Web Calendar ID
- Location
- Description
- * Start Date Time
- * End Date Time

Parameters

- `eventData`. WebEventData object to add.

        }

    }
```

CancelOccurrence

```
CancelOccurrence(System.Int64, System.DateTime)
```

Cancels an occurrence of a recurring event.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Recurring Web Event ID
- * Event Occurrence Date

Parameters

- `eventId`. ID of the recurring event for which to cancel an occurrence.
- `occurrenceStartUtc`. The event occurrence date to cancel.

Returns

ID of the event variance created for the cancellation.

```

CreateVariance

```
CreateVariance(System.Int64, System.DateTime)
```

Creates a WebEventData object representing variance event for the supplied recurring event ID. The WebEventData object is not yet saved and should be passed to `Add()` when ready for saving.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Recurring Web Event ID
- * Event Occurrence Date

Parameters

- `eventId`. ID of the recurring event for which to create a variance.
- `occurrenceStartUtc`. The event occurrence date for which to create a variance.

Returns

An unsaved WebEvent representing the event variance.

Remarks

You should pass the WebEventData to `Add()` when you are ready to save the object.

Delete

```
Delete(System.Int64)
```

Deletes a Web calendar event from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Event ID

Parameters

- `id`. ID of WebEvent to delete.

Remarks

Validate the item using `GetItem()` before deleting.

        }

    }
```

GetEventOccurrenceList (date/time)

```
GetEventOccurrenceList(System.Int64,System.DateTime,System.DateTime,System.Boolean)
```

Returns a list of events for the calendar that occur during the supplied time period. This will return all event occurrences including individual occurrences for recurring events.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- * Start Date Time
- * End Date Time

Parameters

- `calendarId`. ID of the calendar to retrieve events for.
- `startUtc`. Start of search span.
- `endUtc`. End of search span.

Returns

Retrieved list of WebEventData objects.

GetEventOccurrenceList (event taxonomy)

8.60 and higher

```
GetEventOccurrenceList(System.Int64,System.DateTime,System.DateTime,
System.Collections.Generic.List)
```

Retrieves a list of events for the calendar that occur during the supplied time period. This will return all event occurrences including individual occurrences for recurring events.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- * Start Date Time
- * End Date Time
- Taxonomy Property
- * Object Value

Parameters

- `criteria`. Criteria used to restrict Web Event retrieval.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

       }
```

GetEventOccurrenceList (Web event)

8.60 and higher

```
GetEventOccurrenceList(System.Int64,System.DateTime,System.DateTime)
```

Retrieves a list of events for the calendar that occur during the supplied time period. This will return all event occurrences including individual occurrences for recurring events.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- * Start Date Time
- * End Date Time

Parameters

- `criteria`. Criteria used to restrict WebEvent retrieval.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

    }
```

GetList (ID)

```
GetList(System.Int64)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID

Parameters

- `calendarId`. ID of the calendar for which to retrieve events.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

GetList (taxonomy)

8.60 and higher

```
GetList(Ektron.Cms.EventTaxonomyCriteria)
```

Returns a list of WebEvents based upon the supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Event Property
- * Object Value

Parameters

- `criteria`. Criteria used to restrict WebEvent retrieval.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

GetNonVariantEventList (date/time)

```
GetVariantEventList(System.Int64,System.DateTime,System.DateTime)
```

Returns a list of original event data items for the calendar. For recurring events, this only returns the actual event items and not the occurrences or variants of recurring events.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- * Start Date Time
- * End Date Time

Parameters

- `calendarId`. ID of the calendar for which to retrieve events.
- `startUtc`. Start of time period to retrieve.
- `endUtc`. End of time period to retrieve.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

GetNonVariantEventList (ID)

```
GetNonVariantEventList(System.Int64)
```

Retrieves list of original `eventdata` items for the calendar. For recurring events, this method returns only the actual event items and not the occurrences or variants of recurring events.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID

Parameters

- `calendarId`. ID of the calendar for which to retrieve events.

Returns

Retrieved list of WebEventData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

GetVariantEventList (date/time)

```
GetVariantEventList(System.Int64,System.DateTime,System.DateTime)
```

Retrieves an `EventVarianceDictionary` containing all the variances for the supplied calendar in the given time frame.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID
- * Start Date Time
- * End Date Time

Parameters

- `calendarId`. ID of the calendar for which to retrieve events.
- `startUtc`. Start of time period to retrieve.
- `endUtc`. End of time period to retrieve.

Returns

Retrieved `WebEventVarianceDictionary` object which is a specialized Dictionary class for organizing event variances. Key is the recurring event ID. Value is collection of WebEvents that are variances associated with the original recurring event.

```
public class WebEventVarianceDictionary :
  System.Collections.Generic.Dictionary<long,List<WebEventData>>
```

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

GetVariantEventList (ID)

```
GetVariantEventList(System.Int64)
```

Retrieves an `EventVarianceDictionary` containing all the variances for the supplied calendar in the given time frame.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Calendar ID

Parameters

- `calendarId`. ID of the calendar for which to retrieve events.

Returns

Retrieved `WebEventVarianceDictionary` object which is a specialized Dictionary class for organizing event variances. Key is the recurring event ID. Value is collection of WebEvents that are variances associated with the original recurring event.

```
public class WebEventVarianceDictionary :
  System.Collections.Generic.Dictionary<long,List<WebEventData>>
```

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.WebEventData)
```

Updates an existing WebEvent item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Web Event ID
- Web Event Title
- Location
- Description
- Start Date Time
- End Date Time

Parameters

- `eventData`. `WebEventData` object to update.

Returns

Returns the WebEventData object updated.

Remarks

Validate the WebEvent item with `GetItem()` before you update the properties. Then, call `Update` with your modified `WebEventData` object.

NOTE: You cannot change all properties after the initial Add event, such as the WebEventData.Type.

WebEventCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Common
```

Constructors

- `WebEventCriteria()`

  ```
  public WebEventCriteria()
  ```

- `WebEventCriteria(Ektron.Cms.Common.WebEventProperty, EkEnumeration.OrderByDirection)`

  ```
  public WebEventCriteria(Ektron.Cms.Common.WebEventProperty orderByField,
    EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `WebEventProperty` are:

  - CalendarId
  - DateCreated
  - DateModified
  - Description
  - Duration
  - EndUtc
  - Id
  - IsAllDay
  - IsCancelled
  - IsVariance
  - LanguageId
  - LastEditorFirstName
  - LastEditorLastName
  - Location
  - ParentEventId
  - RecurrenceEndDate
  - RecurrenceId
  - RecurrenceType
  - StartUtc
  - Status
  - Title

WebEventData

Namespace

```
Ektron.Cms.Common.Calendar
```

Properties

- `CanDelete`. Indicates whether the current user has permission to delete the event. It is filled only when loaded from `GetWebEventList`.

```
public bool CanDelete { set; get; }
```

- `CanEdit`. Indicates whether the current user has permission to edit the event. It is filled only when loaded from `GetWebEventList`.

```
public bool CanEdit { set; get; }
```

- `Clone()`. Returns a clone of the current `WebEventData` object.

```
public virtual Ektron.Cms.Common.Calendar.WebEventData Clone()
```

- `CreateVariance(System.DateTime)`. Creates a variance event for the current recurring event. Returns an unsaved `WebEvent` representing the event variance. `occurrenceStartUtc` is the event occurrence date for which to create a variance.

```
public virtual Ektron.Cms.Common.Calendar.WebEventData
 CreateVariance(System.DateTime occurrenceStartUtc)
```

- `CreateVariance(System.DateTime, System.DateTime)`. Creates a variance event for the current recurring event. Returns an unsaved `WebEvent` representing the event variance. `occurrenceStartUtc` is the event occurrence date for which to create a variance. `newStartUtc` is the new occurrence start date (UTC).

```
public virtual Ektron.Cms.Common.Calendar.WebEventData
  CreateVariance(System.DateTime originalStartUtc, System.DateTime newStartUtc)
```

- `CurrentEditor`. Filled with the current editor if there is one.

```
public long CurrentEditor { set; get; }
```

- `CurrentTimeZone`. Gets or sets the current timezone for the event. Setting the timezone will alter the value of the `EventStart` property based upon the new timezone's UTC Bias. The underlying UTC value of this event's eventstart property will not change. However, any new values applied to `EventStart` will use the new TimeZone when setting the underlying `EventStartUtc` value.

```
public Ektron.Cms.Common.Calendar.TimeZoneInfo CurrentTimeZone { set; get; }
```

- `Description`. Gets or sets the description of the event.

```
public string Description { set; get; }
```

- `DisplayTitle`. Gets or sets the display title of event. This could be different than the base `Content.Title` if this is a variant of a recurring event. In that case the `Content.Title` may be "Event Name (2)" and the `DisplayTitle` would still be "Event Name".

```
public string DisplayTitle { set; get; }
```

- `Duration`. Gets or sets the current duration of the event. Changing this will affect the `EventEnd` time.

```
public System.TimeSpan Duration { set; get; }
```

- `EventEnd`. Gets and sets the event's end time based upon the current timezone. Setting this value will alter `EventEndUTC` based upon the current timezone's UTC

bias.

```
public System.DateTime EventEnd { set; get; }
```

- `EventEndUtc`. Gets or sets the `EventEnd` time of the event in UTC time.

```
public System.DateTime EventEndUtc { set; get; }
```

- `EventStart`. Gets and sets the event's start time based upon the current timezone. Setting this value will alter `EventStartUTC` based upon the current timezone's UTC bias.

```
public System.DateTime EventStart { set; get; }
```

- `EventStartUtc`. Gets or sets the `EventStart` time of the event in UTC time.

```
public System.DateTime EventStartUtc { set; get; }
```

- `GetEventStartUtcForOccurrence(System.DateTime)`. Returns the `EventStartUtc` for a specific event occurrence. This method is only applicable to recurring events. The `EventStartUtc` time is based upon the `EventStart` for originating timezone and may fluctuate. The local `EventStart` for the originating timezone will always remain consistent. For example, an 8:00 AM ET is consistent in both standard and daylight time and therefore, the UTC value may change based upon the occurrence date.

```
public System.DateTime GetEventStartUtcForOccurrence(System.DateTime
occurrenceDate)
```

- `GetEventStartUtcForOccurrence (Ektron.Cms.Common.Calendar.WebEventData, System.DateTime)`. Returns the `EventStartUtc` for event occurrence on the supplied date. This method is only applicable to recurring events. The `EventStartUtc` time is based upon the `EventStart` for originating timezone and may fluctuate. The local `EventStart` for the originating timezone will always remain consistent. For example, an 8:00 AM ET is consistent in both standard and daylight time and therefore, the UTC value may change based upon the occurrence date. Exposing this statically so the logic can be used by recurrence managers without creating instance of `WebEvent` as they only require `WebEventData` classes.

```
public static System.DateTime
  GetEventStartUtcForOccurrence(Ektron.Cms.Common.Calendar.WebEventData eventData,
  System.DateTime occurrenceDate)
```

- `GetOriginalTimeZoneEventStart()`. Returns the recurring `EventStart` in the originating timezone. This time should remain consistent for all occurrences. This method is only applicable to recurring events.

```
public System.DateTime GetOriginalTimeZoneEventStart()
```

- `GetOriginalTimeZoneEventStart (Ektron.Cms.Common.Calendar.WebEventData)`. Returns the recurring `EventStart` in the originating timezone. This time should remain consistent for all occurrences. This method is only applicable to recurring events. Exposing this statically so the logic can be used by recurrence managers without creating instance of `WebEvent` as they only require `WebEventData` classes.

```
public static System.DateTime
 GetOriginalTimeZoneEventStart(Ektron.Cms.Common.Calendar.WebEventData eventData)
```

- `IsAllDay`. Gets or sets the `IsAllDay` flag of the event. A true value means the event is an all day event with no actual start\end.

```
public bool IsAllDay { set; get; }
```

- `IsCancelled`. Gets or sets the `IsVariance` flag for the event. A true value means that this event is a cancelled occurrence of a recurring event.

```
public bool IsCancelled { set; get; }
```

- `IsRecurring`. Gets a boolean value indicating if the current event is a recurring event.

```
public bool IsRecurring { get; }
```

- `IsVariance`. Gets or sets the `IsVariance` flag for the event. A true value means this event is a variance of an occurrence of a recurring event.

```
public bool IsVariance { set; get; }
```

- `Location`. Gets or sets the location of the event.

```
public string Location { set; get; }
```

- `OriginalStartUtc`. Gets or sets the `OriginalStartUtc` time. The original `OriginalStartUtc` is the UTC time of the original occurrence of a recurring event. It is used to calculate TimeZone adjusted times of event occurrences.

```
public System.DateTime OriginalStartUtc { set; get; }
```

- `OriginalTimeZone`. Gets or sets the original timezone for this event

```
public Ektron.Cms.Common.Calendar.TimeZoneInfo OriginalTimeZone { set; get; }
```

- `ParentEventId`. Gets or sets the recurrence ID of the event. The recurrence ID is the event ID of the original recurring event. This value is needed to tie event variances back to the original recurring event.

```
public long ParentEventId { set; get; }
```

- `Recurrence`. Gets or sets the current recurrence pattern for the event.

```
public Ektron.Cms.Common.RecurrenceData Recurrence { set; get; }
```

- `UtcOffset`. Gets the `UtcOffset` of the current timezone.

```
public System.TimeSpan UtcOffset { get; }
```

- `Validate()`. Validates the event object and returns a list of errors.

```
public virtual ValidationResults Validate()
```

- `WebEventData()`

```
public WebEventData()
```

Commerce

9.00 and higher

The Commerce category manages commerce exchange on the Web and has the following classes:

- *AddressManager* on the next page. Manages addresses in the CMS.
- *BasketItemManager* on page 345. Manages product items in the basket.
- *BasketManager* on page 360. Manipulates the baskets in e-commerce.
- *CatalogEntryManager* on page 387. Manipulates the catalog entry data in CMS.
- *CountryManager* on page 419. Manipulates the country data in the CMS.
- *CouponManager* on page 435. Manipultes the coupon data in the CMS. It can be used for add, edit, and get the coupon data object.
- *CreditCardTypeManager* on page 480. Manages credit card types in the CMS.
- *CurrencyManager* on page 499. Manages commerce currencies in the CMS.
- *CustomerManager* on page 519. Manipulates e-commerce customer details in CMS.
- *ExchangeRateManager* on page 550. Manages commerce exchange rates in the CMS.
- *InventoryManager* on page 570. Manages inventory in the CMS.
- *OrderManager* on page 591. Manages commerce orders in the CMS.
- *PackageManager* on page 628. Manages commerce packages in the CMS.
- *PasswordHistoryManager* on page 644. Manages password histories.
- *PaymentGatewayManager* on page 665. Manages the commerce paymentgateway in the CMS.
- *ProductTypeManager* on page 683. Manipulates the catalog's product type data in CMS.
- *RecommendationManager* on page 700. Manipulates the recommendated items to the catalog entry.
- *RegionManager* on page 715. Manages regions in the CMS.
- *ShippingMethodManager* on page 730. Manages shipping methods in CMS.
- *TaxClassManager* on page 743. Manages tax class in the CMS.
- *TaxRateManager* on page 755. Manages commerce tax rates in the CMS.
- *TaxTypeManager* on page 780. Manages commerce tax types in the CMS.
- *WarehouseManager* on page 792. Manages commerce warehouses in the CMS.

AddressManager

9.00 and higher

The class manages addresses in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.AddressManager
```

Constructors

- `AddressManager()`
- `AddressManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add (address)

```
Add(Ektron.Cms.Commerce.AddressData)
```

Adds a new address based on information in an AddressData object. AddressData.Id is populated with the newly created ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Phone

Parameters

- `addressData`. The AddressData object to add.

Returns

Returns added AddressData object.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxAddressNameLabel" AssociatedControlID="uxAddressName"

            addressData.Country = new CountryData { Id = int.Parse(uxCountryId.Text) };

            addressManager.Add(addressData);
```

```
            MessageUtilities.UpdateMessage(uxMessage, "AddressData is added with Id " +
addressData.Id, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
```

Add (customer ID)

```
Add(Ektron.Cms.Commerce.AddressData,System.Int64)
```

Adds a new address based on information in an AddressData object and associates with a customer. AddressData.Id is populated with the newly created ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Phone
- * Customer ID

Parameters

- `addressData`. The AddressData object to add.
- `customerId`. The ID of customer to which this address belongs.

Returns

Returns added AddressData object.

        }
    }
```

Delete

Deletes an address.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `addressId`. The ID of the AddressData object to delete.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxAddressIdLabel" AssociatedControlID="uxAddressId"

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves an AddressData object by providing its ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `addressId`. The ID the of AddressData object to retrieve.

Returns

Returns an AddressData object.

        }
    }
```

GetList

```
GetList(Ektron.Cms.Commerce.AddressCriteria)
```

Retrieves the list of addresses based on the supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Address Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve the address.

Returns

Returns the list of AddressData object.

See *Criteria use for GetList methods* on page 156 for additional information.

.aspx code snippet

```

Update

```
Update(Ektron.Cms.Commerce.AddressData)
```

Updates the supplied Address.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Id
- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Phone
- * Customer ID

Parameters

- `addressData`. The ID the of AddressData object to retrieve.

Returns

Returns an updated AddressData object.

UpdateOrderAddress

```
UpdateOrderAddress(Ektron.Cms.Commerce.AddressData,System.Int64,
  System.Boolean,System.Boolean)
```

Updates an address associated with an order. This update only affects this specific address and does not affect the customer's actual saved address.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- ID
- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Phone
- * Order ID
- * Is Shipping
- * Is Billing

Parameters

- `addressData`. Address information to update.
- `orderId`. ID of the order for which to update the address.
- `isBilling`. If true, updates the billing address for an order.
- `isShipping`. If true, updates the shipping address for an order.

Returns

Returns an updated AddressData object.

Data Classes

AddressCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `AddressCriteria()`

  ```
  public AddressCriteria()
  ```

- `AddressCriteria(Ektron.Cms.Common.AddressProperty, EkEnumeration.OrderByDirection)`

  ```
  public AddressCriteria(Ektron.Cms.Common.AddressProperty orderByField,
    EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `AddressProperty` are:

  - City
  - Company
  - CountryId
  - CustomerId
  - Id
  - IsCommercial
  - Name
  - PostalCode

- RegionId
- Validated

AddressData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `AddressData()`. Constructor

```
public AddressData()
```

- `AddressData(string, string, Ektron.Cms.Commerce.RegionData, Ektron.Cms.Commerce.CountryData, string, string)`. Constructor.

```
public AddressData(string name, string addressLine1,
  Ektron.Cms.Commerce.RegionData region,
  Ektron.Cms.Commerce.CountryData country,
  string city, string postalcode)
```

- `AddressData(string, string, Ektron.Cms.Commerce.RegionData, Ektron.Cms.Commerce.CountryData, string, string)`. Constructor.

```
public AddressData(string name, string addressLine1,
  Ektron.Cms.Commerce.RegionData region,
  Ektron.Cms.Commerce.CountryData country,
  string city, string postalCode, bool iscommercial)
```

- `AddressLine1`. Gets or sets the first line of the address. This property is required when creating an address data object.

```
public string AddressLine1 { set; get; }
```

- `AddressLine2`. Gets or sets line 2 of address.

```
public string AddressLine2 { set; get; }
```

- `City`. Gets or sets the city associated with this address. This property is required when creating an address data object.

```
public string City { set; get; }
```

- `Company`. Gets or sets the name of the company associated with this address. For example, if the address is for Ektron, enter "Ektron, Inc." in the property.

```
public string Company { set; get; }
```

- `Country`. Gets or sets the country associated with this address.

```
public Ektron.Cms.Commerce.CountryData Country { set; get; }
```

- `Id`. Gets or sets the ID of an address.

```
public long Id { set; get; }
```

- `IsCommercial`. Gets or sets whether this address is commercial.

```
public bool IsCommercial { set; get; }
```

- `IsValidated`. Gets or sets whether this address is validated. Validation can come from third-party services.

```
public bool IsValidated { set; get; }
```

- `Name`. Gets or sets the name associated with the address. For example, if you are entering an address for Ivan Tory, enter the name "Ivan Tory" in this property. This property is required when creating an address data object.

```
public string Name { set; get; }
```

- `Phone`. Gets or sets the phone number associated with this address.

```
public string Phone { set; get; }
```

- `PostalCode`. Gets or sets the postal code associated with this address. This property is required when creating an address data object.

```
public string PostalCode { set; get; }
```

- `Region`. Gets or sets the region associated with this address.

```
public Ektron.Cms.Commerce.RegionData Region { set; get; }
```

- `Validate()`

```
public ValidationResults Validate()
```

BasketItemManager

9.00 and higher

The class manages product items in the basket.

Namespace

```
Ektron.Cms.Framework.Commerce.BasketItemManager
```

Constructors

- `BasketItemManager()`
- `BasketItemManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 348
- *GetKitConfiguration(user)* on page 352
- *GetKitConfiguration (shopper)* on page 350
- *Update* on page 354
- *UpdateQuantity* on page 356

Add

```
Add(Ektron.Cms.Commerce.BasketItemData)
```

Adds the product or variant or kit items to the basket.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Basket ID
- * Product ID
- Quantity

Parameters

- `basketItemData`. BasketItemData object to be added.

Returns

Returns the added basket item data.

GetKitConfiguration (shopper)

```
GetKitConfiguration(System.Int64,System.String)
```

Retrieves the kit configuration data.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Basket Item ID
- Shopper ID

Parameters

- `basketItemId`. ID of the basket item.
- `shopperId`. ID of the shopper; it should be a GUID.

Returns

Kit configuration data for the basket item.

Data Classes

BasketItemData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `BasketId`

  ```
  public long BasketId { set; get; }
  ```

- `VariantId`

  ```
  public long VariantId { set; get; }
  ```

BasketManager

9.00 and higher

This class manipulates the baskets in eCommerce.

Namespace

```
Ektron.Cms.Framework.Commerce.BasketManager
```

Constructors

- `BasketManager()`
- `BasketManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *SetDefault* on page 381
- *Update* on page 383

Add

```
Add(Ektron.Cms.Commerce.BasketData)
```

Adds the new basket to the specific user in CMS. The `basketData.Id` is populated with the Id of the new basket.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- Shopper ID

Parameters

- `basketData`. Basket object to be added.

Returns

Returns the added BasketData object.

```

GetDefault (shopper)

```
GetDefault(System.String)
```

Gets a default basket for a non-logged in user based upon the shopper's GUID string.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Shopper ID

Parameters

- `shopperId`. The ID of the non-logged in shopper.

Returns

Returns the default basket object of the shopper.

```

Update

```
Update(Ektron.Cms.Commerce.BasketData)
```

Updates the existing basket in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Basket ID
- Name
- Is Default

Parameters

- `basketData`. Basket object to be updated.

Returns

Returns the updated BasketData object.

Data Classes

BasketData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `BasketData()`

  ```
  public BasketData()
  ```

- `DateCreated`. Gets or sets the date created.

  ```
  public System.DateTime DateCreated { set; get; }
  ```

- `DateModified`. Gets or sets the date modified.

  ```
  public System.DateTime DateModified { set; get; }
  ```

- `HasRecurringItems`

  ```
  public bool HasRecurringItems { get; }
  ```

- `HasSubscriptions`

  ```
  public bool HasSubscriptionItems { get; }
  ```

- `HasTangibleItems`

  ```
  public bool HasTangibleItems { get; }
  ```

- `Id`. Gets or sets the Id of the Basket.

  ```
  public long Id { set; get; }
  ```

- `IsDefault`. Gets or sets value indicating whether or not this basket is the default basket for customers.

```
public bool IsDefault { set; get; }
```

- `Items`. Gets the collection items in the basket.

```
public Ektron.Cms.Commerce.BasketItemCollection Items { set; get; }
```

- `Name`. Gets or sets the name of the basket.

```
public string Name { set; get; }
```

- `ShippingAddressId`. Gets or sets the ID of the address this basket will be shipping to. This is used for calculating taxes, shipping, and so on.

```
public long ShippingAddressId { set; get; }
```

- `ShippingMethodId`. Gets or sets the ID of the shipping method to be used for the basket. This is used for calculating shipping costs.

```
public long ShippingMethodId { set; get; }
```

- `ShopperId`. Gets or sets the Shopper\visitor Id using the basket. This Id is used when customer is not logged in.

```
public string ShopperId { set; get; }
```

- `Subtotal`. Gets the basket subtotal.

```
public decimal Subtotal { get; }
```

- `UserId`. Gets or sets the Id of the user asscoiated with the basket.

```
public long UserId { set; get; }
```

CatalogEntryManager

9.00 and higher

The class manipulates the catalog entry data in CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.CatalogEntryManager
```

Constructors

- `CatalogEntryManager()`
- `CatalogEntryManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Submit* on page 408
- *Update* on page 410

Add

```
Add(Ektron.Cms.Commerce.EntryData)
```

Adds a new catalog entry into the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * HTML
- * Catalog Folder ID
- * Currency ID
- * Tax Class ID
- * Product Type ID

Parameters

- `entryData`. The EntryData object to be added.

Returns

Returns added EntryData object.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

EnableInventory

```
EnableInventory(System.Int64)
```

Enables the inventory option specific catalog entry item.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `entryId`. ID of the catalog entry item.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves a single catalog entry in the current language based on the entry's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `entryId`. The ID of catalog entry to be retrieved.

Returns

Entry data object.

                uxCatalogEntryDataListView.Visible = true;
                uxCatalogEntryDataListView.DataSource = entryDataList;
                uxCatalogEntryDataListView.DataBind();

            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Restore

```
Restore(System.Int64,System.Int64)
```

Restores a previous version of a catalog entry based on its ID and the version ID to restore.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Version ID

Parameters

- `entryId`. The ID of the catalog entry to restore.
- `versionId`. Version ID to restore.

.aspx code snippet

```

Data Classes

CatalogEntryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CatalogEntryCriteria()`

  ```
  public CatalogEntryCriteria()
  ```

- `CatalogEntryCriteria(Ektron.Cms.Commerce.EntryProperty, EkEnumeration.OrderByDirection)`

  ```
  public CatalogEntryCriteria(Ektron.Cms.Commerce.EntryProperty
    entryProperty, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `EntryProperty`are:

  - AverageRating
  - CatalogId
  - CollItemsDisplayOrder
  - ContentStatus
  - CurrencyId
  - EndDate

- EntryType
- GoLive
- Html
- Id
- IsArchived
- IsBuyable
- IsPublished
- IsSearchable
- LanguageId
- LastEditDate
- LastEditorFirstName
- LasteditorLastName
- ListPrice
- Media
- NumberRated
- ProductTypeId
- ReturnEntryPricebookprice
- SalePrice
- Sku
- Status
- Summary
- TaxClassId
- TaxItemDisplayOrder
- Title
- ViewCount

EntryAttributeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `AddAttributeFilter(string, Ektron.Cms.Common.CriteriaFilterOperator, object)`

```
public Ektron.Cms.Common.CriteriaFilterGroup<EntryAttributeCriteriaProperty>
  AddAttributeFilter(string attributeName,
    Ektron.Cms.Common.CriteriaFilterOperator filterOperator,
    object value)
```

- `AddAttributeFilter(long, Ektron.Cms.Common.CriteriaFilterOperator, object)`

```
public
  Ektron.Cms.Common.CriteriaFilterGroup<EntryAttributeCriteriaProperty>
  AddAttributeFilter(long attributeId,
    Ektron.Cms.Common.CriteriaFilterOperator filterOperator,
    object value)
```

- `AddFilter(Ektron.Cms.Commerce.EntryAttributeCriteriaProperty, Ektron.Cms.Common.CriteriaFilterOperator, object)`

```
public override
  Ektron.Cms.Common.CriteriaFilter<EntryAttributeCriteriaProperty>
  AddFilter(Ektron.Cms.Commerce.EntryAttributeCriteriaProperty field,
    Ektron.Cms.Common.CriteriaFilterOperator filterOperator,
    object value)
```

- `EntryAttributeCriteria()`

```
public EntryAttributeCriteria()
```

- `EntryAttributeCriteria (Ektron.Cms.Commerce.EntryAttributeCriteriaProperty, EkEnumeration.OrderByDirection)`

```
public
  EntryAttributeCriteria(Ektron.Cms.Commerce.EntryAttributeCriteriaProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `EntryAttributeCriteriaProperty` are:

- AttributeDataType
- AttributeDisplayOrder
- AttributeId
- AttributeName
- AttributeValue
- CatalogId
- CurrencyId
- EndDate
- EntryId
- EntryType
- GoLive
- IsArchived
- IsBuyable
- IsPublished
- IsSearchable
- LanguageId
- LastEditDate
- LastEditorFirstName
- LasteditorLastName
- ListPrice
- PricebookId

- PricebookPrice
- ProductTypeId
- SalePrice
- Sku
- TaxClassId
- Title

- `FindAttributeValueFilter(string)`

```
public Ektron.Cms.Common.CriteriaFilter<EntryAttributeCriteriaProperty>
  FindAttributeValueFilter(string attributeName)
```

- `FindAttributeValueFilter(long)`

```
public Ektron.Cms.Common.CriteriaFilter<EntryAttributeCriteriaProperty>
  FindAttributeValueFilter(long attributeId)
```

EntryData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `AnalyticsInfo`

```
public AnalyticsData AnalyticsInfo { set; get; }
```

- `Attributes`. Gets or sets the attributes of the Catalog Entry.

```
public System.Collections.Generic.List<EntryAttributeData>
  Attributes { set; get; }
```

- `Comment`

```
public string Comment { set; get; }
```

- `ContentStatus`. The status of the content information.

```
public string ContentStatus { set; get; }
```

- `CurrencyId`. Gets or sets the Id of the currency used for the current Sale and List prices.

```
public long CurrencyId { set; get; }
```

- `DateModified`

```
public System.DateTime DateModified { set; get; }
```

- `Dimensions`. Gets or sets the dimensions of the product. Used for shipping.

```
public Ektron.Cms.Commerce.Dimensions Dimensions { set; get; }
```

- `DisableInventoryManagement`. Gets or sets the disable inventory management flag. If true, this product does not track inventory and no inventory management is performed.

```
public bool DisableInventoryManagement { set; get; }
```

- `EndDate`. Get or sets the enddate of the EntryData object. Returns the datetime of the entry enddate.

```
public System.DateTime EndDate { set; get; }
```

- `EndDateAction`

```
public int EndDateAction { set; get; }
```

- `EntryData()`

```
public EntryData()
```

- `EntryData(EkEnumeration.CatalogEntryType)`

```
public EntryData(EkEnumeration.CatalogEntryType entryType)
```

- `EntryData(int, EkEnumeration.CatalogEntryType)`

```
public
  EntryData(int languageId, EkEnumeration.CatalogEntryType
  entryType)
```

- `EntryType`. The type of entry. Returns an integer of the entry quantity multiple.

```
public virtual EkEnumeration.CatalogEntryType EntryType
  { set; get; }
```

- `FolderId`. Gets or sets the folder ID of the EntryData object. Returns the ID of the entry folder.

```
public long FolderId { set; get; }
```

- `GoLive`. Get or sets the golive of the EntryData object. Returns the datetime of the entry golive.

```
public System.DateTime GoLive { set; get; }
```

- `Html`. Get or sets the HTML or XML of the EntryData object. Returns the string of the entry HTML.

```
public string Html { set; get; }
```

- `Id`. Gets or sets the ID of the EntryData object. Returns the ID of the entry title.

```
public long Id { set; get; }
```

- `Image`

```
public string Image { set; get; }
```

- `Imagethumbnail`

```
public string ImageThumbnail { set; get; }
```

- `IsArchived`. Get or sets the Archive flag of the EntryData object.

```
public bool IsArchived { set; get; }
```

- `IsAvailable`

```
public bool IsAvailable { set; get; }
```

- `IsBuyable`. Get or sets whether the entry is buyable. Returns a Boolean of the entry flag Buyable.

```
public bool IsBuyable { set; get; }
```

- `IsMarkedForDeletion`. Get or sets the MarkForDeletion flag on the EntryData object. Returns a Boolean of the entry flag MarkForDeletion.

```
public bool IsMarkedForDeletion { set; get; }
```

- `IsPublished`.

```
public bool IsPublished { set; get; }
```

- `IsSearchable`. Gets or sets whether the entry is searchable for the object. True = searchable. Returns a boolean based on whether the entry is searchable. * True = entry is searchable. * False = entry is not searchable.

```
public bool IsSearchable { set; get; }
```

- `IsTangible`. Indicates if this product is a tangible good. Returns a Boolean value indicating if this product is a tangible good.

```
public bool IsTangible { get; }
```

- `LanguageId`. Gets or sets the language of the EntryData object.

```
public int LanguageId { set; get; }
```

- `LastEditorFirstName`.

```
public string LastEditorFirstName { set; get; }
```

- `LastEditorId`

```
public long LastEditorId { set; get; }
```

- `LastEditorLastName`

```
public string LastEditorLastName { set; get; }
```

- `ListPrice`. Gets the current List price from the Pricing object. To set an item's price, Use the Pricing property. Create a TierPrice with a quantity of 1. Use the PricingData(CurrencyId, SalePrice, ListPrice) constructor.

```
public decimal ListPrice { get; }
```

- `Media`

```
public Ektron.Cms.MediaGalleryData Media { set; get; }
```

- `Metadata`

```
public System.Collections.Generic.List<ContentMetaData>
  Metadata { set; get; }
```

- `NumberSold`. Gets or sets the Number Sold for this entry. Returns a content item's Quicklink information.

```
public long NumberSold { set; get; }
```

- `Pricing`. The entry pricing, including currencies and quantity. Returns the pricing data of the catalog entry.

```
public Ektron.Cms.Commerce.PricingData Pricing { set; get; }
```

- `ProductType`

```
public Ektron.Cms.Commerce.ProductTypeData ProductType
  { set; get; }
```

- `QuantityMultiple`. The catalog has these number of items in it. Returns the integer of the entry quantity multiple.

```
public int QuantityMultiple { set; get; }
```

- `Quicklink`. Gets or sets the entry's Quicklink. Returns a content item's Quicklink information.

```
public string Quicklink { set; get; }
```

- `SalePrice`. Gets the current Sale price from the Pricing object. To set an item's sale price, Use the Pricing property. Create a TierPrice with a quantity of 1. Use

the PricingData(CurrencyId, SalePrice, ListPrice) constructor.

```
public decimal SalePrice { get; }
```

- `Sku`. Get or sets the sku of the EntryData object. Returns the string of the entry SKU.

```
public string Sku { set; get; }
```

- `Status`. The status of the entry information.

```
public string Status { set; get; }
```

- `StatusLanguage`. The language that the entry is checked out to, if any.

```
public int StatusLanguage { set; get; }
```

- `Summary`. Get or sets the summary of the EntryData object. Returns the string of the entry summary.

```
public string Summary { set; get; }
```

- `TaxClassId`

```
public long TaxClassId { set; get; }
```

- `TemplateId`

```
public long TemplateId { set; get; }
```

- `Title`. Get or sets the title of the EntryData object. Returns the string of the entry URL.

```
public string Title { set; get; }
```

- `Url`. Get or sets the url of the EntryData object. Returns the string of the entry URL.

```
public string Url { set; get; }
```

- `VersionId`. The version Id of the catalog entry. 0 is the current version.

```
public long VersionId { set; get; }
```

- `Weight`. Gets or sets the weight of the product. Used for shipping.

```
public Ektron.Cms.Commerce.Weight Weight { set; get; }
```

CountryManager

9.00 and higher

The class manipulates the country data in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.CountryManager
```

Constructors

- `CountryManager()`
- `CountryManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.CountryData)
```

Adds a new country to Ektron CMS based on the CountryData object. The Country.Id property is populated with the new Country's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Country ID
- * Country Name
- * Long ISO Code
- * Short ISO Code

Parameters

- `countryData`. The CountryData object to add.

Returns

Returns newly created CountryData object.

CanDelete

```
CanDelete(System.Int32)
```

Checks to see if a country can be deleted. A country cannot be deleted if a region or address uses the country.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Country ID

Parameters

- `countryId`. The ID of the country to delete.

Returns

Returns true if country can safely be deleted.

```

GetList

```
GetList(Ektron.Cms.Commerce.CountryCriteria)
```

Retrieves a list of countries based on filters set in the CountryCriteria property.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Country Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter the list of countries being retrieved.

Returns

A list of countries meeting criteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

Update

```
Update(Ektron.Cms.Commerce.CountryData)
```

Updates an existing country in Ektron CMS based on the CountryData object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Country ID
- Country Name
- Long ISO Code
- Short ISO Code

Parameters

- `countryData`. The CountryData object to save.

Returns

Returns updated CountryData object.

```

```
        }
    }
```

Data Classes

CountryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CountryCriteria()`

  ```
  public CountryCriteria()
  ```

- `CountryCriteria(Ektron.Cms.Commerce.CountryProperty, EkEnumeration.OrderByDirection)`

  ```
  public
    CountryCriteria(Ektron.Cms.Commerce.CountryProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CountryProperty` are:

  - Id
  - IsEnabled
  - LongIsoCode
  - Name
  - ShortIsoCode

CountryData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `CountryData()`

  ```
  public CountryData()
  ```

- `CountryData(int, string, string, string, bool)`

  ```
  public CountryData(int id, string name, string shortIsoCode,
    string longIsoCode, bool enabled)
  ```

- `Enabled`. Gets or sets whether or not the country is enabled for use.

  ```
  public bool Enabled { set; get; }
  ```

- `Id`. Gets or sets the ID of the country. The ID is the ISO numeric code of the country. This property is required when creating an country data object.

  ```
  public int Id { set; get; }
  ```

- `LongIsoCode`. Gets or sets the 3 letter ISO code of the country. This property is required when creating an country data object.

```
public string LongIsoCode { set; get; }
```

- `Name`. Gets or sets the name of the country. This property is required when creating an country data object.

```
public string Name { set; get; }
```

- `ShortIsoCode`. Gets or sets the 2 letter ISO code of the country. This property is required when creating an country data object.

```
public string ShortIsoCode { set; get; }
```

- `ToString`. Returns Name of Country.

```
public override string ToString()
```

- `Validate`. Validates the CountryData object is valid for saving. Returns a ValidationResult object with any validation errors.

```
public ValidationResults Validate()
```

CouponManager

9.00 and higher

The class manipulates the coupon data in the CMS. It can be used for add, edit, and get the coupon data object.

Namespace

```
Ektron.Cms.Framework.Commerce.CouponManager
```

Constructors

- `CouponManager()`
- `CouponManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.CouponData)
```

Adds the new coupon data object into the CMS.The CouponData.Id property is populated with the new Coupon's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Coupon Code
- Coupon Type
- Is Active

Parameters

- `couponData`. Coupon data object to be added.

Returns

CouponData object with new coupon ID.

GetCouponId

```
GetCouponId(System.String)
```

Retrieve the coupon ID by coupon code.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Coupon Code

Parameters

- `couponCode`. Code of the coupon.

Returns

Returns the coupon ID.

        }
    }
```

GetTaxonomyList

```
GetTaxonomyList(Ektron.Cms.Commerce.CouponEntryCriteria)
```

Retrieves the list of coupon entry item based on the supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Value

Parameters

- `criteria`. Criteria used to retrieve the coupon entry.

Returns

Returns the list of CouponEntryData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

Update

```
Update(Ektron.Cms.Commerce.CouponData)
```

Updates the existing coupon data object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Coupon ID
- Coupon Description
- Discount Value

Parameters

- `couponData`. CouponData object to be updated.

Returns

Updated coupon data is returned.

Data Classes

CouponCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CouponCriteria()`

  ```
  public CouponCriteria()
  ```

- `CouponCriteria(Ektron.Cms.Commerce.CouponProperty, EkEnumeration.OrderByDirection)`

  ```
  public
    CouponCriteria(Ektron.Cms.Commerce.CouponProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CouponProperty` are:

  - AppliesToQuantity
  - ApplyOneTime
  - Code
  - CouponType
  - CurrencyId
  - Description
  - DiscountType
  - DiscountValue
  - ExpirationDate
  - Id
  - IsActive
  - IsApplicabletoSubscriptions
  - IsCombinable
  - IsRedeemable
  - MaximumAmount
  - MaximumUses
  - MinimumAmount
  - StartDate
  - UseCount

CouponData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `AppliesToQuantity`. For an DiscountType.Amount coupon, defines the applicable quantity for a single line in a basket. Default is 1. Example, if you have a $5 Amount coupon, and a quantity 5 of a $10 item (total cost $50), by default the coupon applies to the first item only: $50 - $5 = $45. Change the AppliesToQuantity value to 2, the coupon applies to 2 of the item quantity: $50 - $10 = $40. Change the AppliesToQuantity value to 3, the coupon applies to 3 of the item quantity: $50 - $15 = $35. And so on...

  ```
  public bool AppliesToQuantity { set; get; }
  ```

- `Code`. Gets or sets the coupon code.

  ```
  public string Code { set; get; }
  ```

- `CouponData()`

  ```
  public CouponData()
  ```

- `CouponData(long, string, System.DateTime, System.DateTime, EkEnumeration.CouponDiscountType, decimal, decimal, EkEnumeration.CouponType, int, bool, int).`

  ```
  public CouponData(long couponId, string couponCode,
    System.DateTime startDate, System.DateTime expirationDate,
    EkEnumeration.CouponDiscountType discountType,
    decimal discountValue, decimal minimumAmount,
    EkEnumeration.CouponType couponType, int maximumUses,
    bool applyOnePerCustomer, int currencyId)
  ```

- `CouponType`. Gets or sets the coupon type.

  ```
  public EkEnumeration.CouponType CouponType { set; get; }
  ```

- `CreateFixedDiscountCoupon(string, System.DateTime, System.DateTime, decimal, decimal, EkEnumeration.CouponType, int, bool, int)`

  ```
  public static Ektron.Cms.Commerce.CouponData
    CreateFixedDiscountCoupon(string couponCode,
      System.DateTime startDate, System.DateTime
      expirationDate, decimal discountAmount,
      decimal minimumAmount, EkEnumeration.CouponType
      couponType, int maximumUses, bool applyOnePerCustomer,
      int currencyId)
  ```

- `CreateFreeShippingCoupon(string, System.DateTime, System.DateTime, decimal, EkEnumeration.CouponType, int, bool)`

  ```
  public static Ektron.Cms.Commerce.CouponData
    CreateFreeShippingCoupon(string couponCode,
      System.DateTime startDate, System.DateTime expirationDate,
      decimal minimumAmount, EkEnumeration.CouponType couponType,
      int maximumUses, bool applyOnePerCustomer)
  ```

- `CreatePercentageDiscountCoupon(string, System.DateTime, System.DateTime, decimal, decimal, EkEnumeration.CouponType, int, bool, int)`

```
public static Ektron.Cms.Commerce.CouponData
  CreatePercentageDiscountCoupon(string couponCode,
    System.DateTime startDate, System.DateTime expirationDate,
    decimal discountPercentage, decimal minimumAmount,
    EkEnumeration.CouponType couponType, int maximumUses,
    bool applyOnePerCustomer, int currencyId)
```

- `CurrencyId`. Gets or sets the Id of the currency this coupon applies to.

```
public int CurrencyId { set; get; }
```

- `Description`. Gets or sets the description of the coupon.

```
public string Description { set; get; }
```

- `DiscountType`. Gets or sets the Coupon Discount Type.

```
public EkEnumeration.CouponDiscountType DiscountType { set; get; }
```

- `DiscountValue`. Gets or sets the value of the discount. For a fixed amount, this would be the amount (i.e. 5.00). For percentage, it would be the discount percent value in whole numbers (i.e. 15% = 15.00).

```
public decimal DiscountValue { set; get; }
```

- `ExpirationDate`. Gets or sets the date the coupon expires.

```
public System.DateTime ExpirationDate { set; get; }
```

- `Id`. Gets or sets the Id of the coupon.

```
public long Id { set; get; }
```

- `IsActive`. Determines whether or not this coupon is currently active. Deleted coupons remain in the system and are marked inactive.

```
public bool IsActive { set; get; }
```

- `IsApplicabletoSubscription`. Determines whether this coupon is applicable to subscription.

```
public bool IsApplicabletoSubscriptions { set; get; }
```

- `IsCombinable`. Determines whether or not this coupon can be combined with other coupons. If true, this coupon can be combined with other "Combinable" coupons.

```
public bool IsCombinable { set; get; }
```

- `IsRedeemable`. Determines whether or not this coupon is currently redeemable. A coupon may not be reddemable if the it is inactive, not within its valid period, or has been redeemed the maximum number of times.

```
public bool IsRedeemable { set; get; }
```

- `MaximumAmount`. Gets or sets the maximum order amount that this coupon can be applied to.

```
 public decimal MaximumAmount { set; get; }
```

- `MaximumUses`. Gets or sets the maximim number of times this coupon can be used before it expires.

```
public int MaximumUses { set; get; }
```

- `MinimumAmount`. Gets or sets the minimum order amount required before the coupon is applicable.

```
public decimal MinimumAmount { set; get; }
```

- `OnePerCustomer`. Gets or sets the OnePerCuster value. If true, this coupon can only be used once by each customer.

```
public bool OnePerCustomer { set; get; }
```

- `StartDate`. Gets or sets the date the coupon becomes valid.

```
public System.DateTime StartDate { set; get; }
```

- `UserCount`. Returns the count representing the number of orders that this coupon has been applied to.

```
public long UseCount { set; get; }
```

- `Validate`. Validates the CouponData object is valid for saving. Returns a ValidationResult object with any validation errors.

```
public ValidationResults Validate()
```

CouponEntryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CouponEntryCriteria()`

```
public CouponEntryCriteria()
```

- `CouponEntryCriteria(Ektron.Cms.Commerce.CouponEntryProperty, EkEnumeration.OrderByDirection)`

```
public
  CouponEntryCriteria(Ektron.Cms.Commerce.CouponEntryProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

  Accepted fields for the `CouponEntryProperty` are:

  - CouponId
  - IsIncluded
  - ObjectId
  - ObjectType
  - Path
  - Title

CouponEntryData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Clone()`

```
public virtual Ektron.Cms.Commerce.CouponEntryData Clone()
```

- `CouponEntryData()`

```
public CouponEntryData()
```

- `CouponEntryData(long, EkEnumeration.CMSObjectTypes, long, string, bool)`. Gets or sets the Id of the coupon.

```
public CouponEntryData(long objectId,
  EkEnumeration.CMSObjectTypes objectType,
  long couponId, string title, bool isIncluded)
```

- `CouponId`. Gets or sets the ID of the coupon.

```
public long CouponId { set; get; }
```

- `DataState`. Gets or sets the current saved state for the CouponEntry. Used by the Cms internally.

```
public EkEnumeration.DataState DataState { set; get; }
```

- `IsIncluded`. Gets or sets whether or not the Object is included in the coupon. If true, the object is included in the coupon. If false, the coupon is NOT included in the coupon.

```
public bool IsIncluded { set; get; }
```

- `ObjectId`. Gets or sets the Id of object the coupon is applied to.

```
public long ObjectId { set; get; }
```

- `ObjectType`. Gets or sets the type of object this coupon is applied to.

```
public EkEnumeration.CMSObjectTypes ObjectType { set; get; }
```

- `Path`. Gets or sets the Path of the object.

```
public string Path { set; get; }
```

- `Title`. Gets or sets the Title of the object.

```
public string Title { set; get; }
```

CreditCardTypeManager

9.00 and higher

The class manages credit card types in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.CreditCardTypeManager
```

Constructors

- `CreditCardTypeManager()`
- `CreditCardTypeManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.CreditCardTypeData)
```

Adds a new credit card type to CMS. The ID property is populated with the new credit card type's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Credit Card Type Name
- * Regex (/^3[4,7][0-9]{13}$/)
- Is Accepted

Parameters

- `item`. Credit card type object to add.

Returns

Returns added CreditCardTypeData object.

.aspx code snippet

```

GetList

```
GetList(Ektron.Cms.Commerce.CreditCardTypeCriteria)
```

Retrieves a list of credit card types.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Credit Card Type Property
- * Object Value

Parameters

- `criteria`. Criteria object used for sorting, paging, and filtering results.

Returns

Return the CreditCardTypeData list.

See *Criteria use for GetList methods* on page 156 for additional information.

```

IsCardValid

```
IsCardValid(Ektron.Cms.Commerce.CreditCardPayment,System.Boolean)
```

Validates credit card values and date. Does not communicate with the payment gateway.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * CCID
- * Card Number
- * Card Type
- * Expiration Date
- Required CCID

Parameters

- `creditcard`. Credit card payment details.
- `requireCCID`. True or false for required CCID (credit card ID) value.

Returns

Returns the boolean value.

IsDateValid

```
IsDateValid(Ektron.Cms.Commerce.CreditCardPayment)
```

Validates the date of a credit card versus the server's date-and-time.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * CCID
- * Card Number
- * Card Type Name
- * Expiration Date

Parameters

- `creditcard`. Credit card payment details.

Returns

Returns the boolean value.

", Message.DisplayModes.Success);
            else
                MessageUtilities.UpdateMessage(uxMessage, "The given card date is not
valid ", Message.DisplayModes.Error);
```

```
            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Commerce.CreditCardTypeData)
```

Updates an existing credit card type in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Credit Card Type Name
- * Regex (/^3[4,7][0-9]{13}$/)
- Is Accepted

Parameters

- `item`. Credit card type object to save.

Returns

Returns an updated CreditCardTypeData object.

Data Classes

CreditCardTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CreditCardTypeCriteria()`

  ```
  public CreditCardTypeCriteria()
  ```

- `CreditCardTypeCriteria (Ektron.Cms.Commerce.CreditCardTypeProperty, EkEnumeration.OrderByDirection)`

  ```
  public CreditCardTypeCriteria(Ektron.Cms.Commerce.CreditCardTypeProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CreditCardTypeProperty` are:

  - Id
  - IsAccepted
  - Name

CreditCardTypeData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Id`. Gets or sets the Id of the credit card type.

```
public long Id { set; get; }
```

- `Image`. Gets or sets path to image for credit card type.

```
public string Image { set; get; }
```

- `IsAccepted`. Gets or sets whether or not the credit car type is accepted.

```
public bool IsAccepted { set; get; }
```

- `Name`. Gets or sets the name of the credit card.

```
public string Name { set; get; }
```

- `Regex`. Gets or sets the Regex validation for the credit card type.

```
public string Regex { set; get; }
```

CurrencyManager

9.00 and higher

The class manages commerce currencies in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.CurrencyManager
```

Constructors

- `CurrencyManager()`
- `CurrencyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *CanDelete* on page 502
- *Delete* on page 504
- *GetActiveCurrencyList* on page 505
- *GetCurrentCurrency* on page 507
- *GetDefaultCurrency* on page 509
- *GetItem* on page 510
- *GetList* on page 512
- *Update* on page 515

Add

```
Add(Ektron.Cms.Commerce.CurrencyData)
```

Adds a new currency to the CMS. The Currency.Id property is populated with the new Currency's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Alpha ISO Code
- Name
- Culture Code
- Enabled

Parameters

- `currencyData`. CurrencyData object to be added.

Returns

Returns the CurrencyData object.

GetItem

```
GetItem(System.Int32)
```

Retrieves a currency by currency ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Currency ID

Parameters

`currencyId`. ID of currency to be retrieved.

Returns

CurrencyData object.

        }
     }
```

GetList

```
GetList(Ektron.Cms.Commerce.CurrencyCriteria)
```

Retrieves a list of currencies.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Value

Parameters

- `criteria`. Criteria by which to filter currency being retrieved.

Returns

List of currencies meeting criteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

Update

```
Update(Ektron.Cms.Commerce.CurrencyData)
```

Updates an existing currency in Cms.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Name
- * Alpha ISO Code
- Culture Code

Parameters

- `currencyData`. Currency data object to be updated.

Returns

CurrencyData object.

```

Data Classes

CurrencyCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CurrencyCriteria()`

  ```
  public CurrencyCriteria()
  ```

- `CurrencyCriteria(Ektron.Cms.Commerce.CurrencyProperty, EkEnumeration.OrderByDirection)`

  ```
  public CurrencyCriteria(Ektron.Cms.Commerce.CurrencyProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

Accepted fields for the `CurrencyProperty` are:

- AlphaIsoCode
- CultureCode
- Enabled
- Id
- Name

CurrencyData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- AlphaIsoCode. Gets or sets the 3 letter ISO code of the currency.

  ```
  public string AlphaIsoCode { set; get; }
  ```

- `CultureCode`. Gets or sets the culture code associated with this currency. This is used for formatting currency values for this currency.

  ```
  public string CultureCode { set; get; }
  ```

- `CurrencySymbol`. Read only function that gets the symbol for this currency. Example: $

  ```
  public string CurrencySymbol { get; }
  ```

- `Enabled`. Gets or sets whether or not the currency is enabled for use.

  ```
  public bool Enabled { set; get; }
  ```

- `Id`. Gets or sets the Id of the currency. The Id is the ISO numeric code of the currency.

  ```
  public int Id { set; get; }
  ```

- `ISOCurrencySymbol`. Read only function that gets the ISO symbol for this currency. Example: USD

  ```
  public string ISOCurrencySymbol { get; }
  ```

- `Name`. Gets or sets the name of the currency.

  ```
  public string Name { set; get; }
  ```

CustomerManager

9.00 and higher

The class manipulates e-commerce customer details in CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.CustomerManager
```

Constructors

- `CustomerManager()`
- `CustomerManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add (billing address)

```
Add(Ektron.Cms.Commerce.CustomerData,Ektron.Cms.Commerce.AddressData)
```

Adds a new customer with a billing address. The Customer.Id property is populated with the new Customer's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name
- * Password
- * Display Name
- First Name
- Last Name
- Email

Billing Address

- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Parameters

- `customerData`. Customer data to be added.
- `billingAddress`. Billing address of the customer. Also serves as shipping address.

Returns

Returns customer data with new customer's ID.

```

Add (customer ID)

```
Add(Ektron.Cms.Commerce.CustomerData)
```

Adds a new customer. The Customer.Id property is populated with the new Customer's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name
- * Password
- * Display Name
- First Name
- Last Name
- Email

Parameters

- `customerData`. Customer data to be added.

Returns

Returns customer data with new customer's ID.

    }
```

Add (shipping address)

```
Add
(Ektron.Cms.Commerce.CustomerData,Ektron.Cms.Commerce.AddressData,Ektron.Cms.Commerce.Ad
dressData)
```

Adds a new customer with separate billing and shipping addresses. The Customer.Id property is populated with the new Customer's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name
- * Password
- * Display Name
- First Name
- Last Name
- Email

Billing Address

- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Shipping Address

- * Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Parameters

- `customerData`. Customer data to be added.
- `billingAddress`. Billing address of the customer.
- `shippingAddress`. Shipping address of the customer.

Returns

Returns customer data with new customer's ID.

GetList

```
GetList(Ektron.Cms.Commerce.CustomerCriteria)
```

Returns a list of customers based upon supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Customer Property
- * Object Value

Parameters

- `criteria`. Criteria by which to retrieve customer objects.

Returns

List of CustomerData.

See *Criteria use for GetList methods* on page 156 for additional information.

IsUserNameExists

```
IsUserNameExists(System.String)
```

Returns whether the given UserName is available to add new user.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name

Parameters

- `userName`. Name of the User.

Returns

Returns true if UserName is available to add a new user; otherwise false.

        }
    }
```

SetShippingAddress

```
SetShippingAddress(System.Int64,System.Int64)
```

Sets a customers shipping address.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Customer ID
- * Address ID

Parameters

- `customerId`. ID of the customer.
- `addressId`. ID of the address to be set as shipping address to the customer.

Data Classes

CustomerCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `CustomerCriteria()`

```
public CustomerCriteria()
```

- `CustomerCriteria(Ektron.Cms.Commerce.CustomerProperty, EkEnumeration.OrderByDirection))`

```
public CustomerCriteria(Ektron.Cms.Commerce.CustomerProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `CustomerProperty` are:

- BillingAddress
- DateCreated
- DisplayName
- EmailAddress
- FirstName
- Id
- IsDeleted
- IsMember
- LanguageId
- LastName
- ShippingAddressId
- TotalOrders
- TotalOrderValue
- UserName

CustomerData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `AverageOrderValue`. Gets the average order placed by this customer.

```
public decimal AverageOrderValue { get; }
```

- `BillingAddressId`. Gets or sets the Address Id of the billing address for the customer.

```
public long BillingAddressId { set; get; }
```

- `DateCreated`

```
public System.DateTime DateCreated { set; get; }
```

- `DisplayName`. Gets or sets the display name of the customer.

```
public string DisplayName { set; get; }
```

- `EmailAddress`. Gets or sets the email address of the customer.

```
public string EmailAddress { set; get; }
```

- `FirstName`. Gets or sets the first name of the customer.

```
public string FirstName { set; get; }
```

- `Id`. Gets or sets the Id of the customer.

```
public long Id { set; get; }
```

- `IsDeleted`. Gets the IsDeleted status of the customer.

```
public bool IsDeleted { set; get; }
```

- `IsMembershipUser`. Gets or sets the IsMembershipUser status of the customer.

```
public bool IsMembershipUser { set; get; }
```

- `LanguageId`. Gets or sets the integer ID of the language for the UserData object. Returns the integer ID of the language.

```
public int LanguageId { set; get; }
```

- `LastName`. Gets or sets the last of the customer.

```
public string LastName { set; get; }
```

- `Password`. Gets or sets the password for the customer.

```
public string Password { set; get; }
```

- `ShippingAddressId`. Gets or sets Address Id of the shipping address for this customer.

```
public long ShippingAddressId { set; get; }
```

- `TotalOrders`. A read-only property, it gets the total number of orders placed by the customer.

```
public int TotalOrders { set; get; }
```

- `TotalOrderValue`. A read-only property, it gets the total value of orders placed by the customer.

```
public decimal TotalOrderValue { set; get; }
```

- `UserId`. Gets or sets the Id of the Cms User object associated with this customer.

```
public long UserId { set; get; }
```

- `UserName`. Gets or sets the username for the customer.

```
public string UserName { set; get; }
```

ExchangeRateManager

9.00 and higher

The class manages commerce exchange rates in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.ExchangeRateManager
```

Constructors

- `ExchangeRateManager()`
- `ExchangeRateManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 553
- *GetCurrentExchangeRate* on page 555
- *GetCurrentExchangeRate (ID)* on page 557
- *GetCurrentList* on page 559
- *GetList* on page 562
- *Update* on page 565

Add

```
Add(Ektron.Cms.Commerce.ExchangeRateData)
```

Adds a new exchange rate to the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Base Currency ID
- * Exchange Currency ID
- Rate
- * Effective Date

Parameters

- `exchangeRateData`. Exchange rate data to be added.

Returns

ExchangeRateData object.

        }
    }
```

Update

```
Update(Ektron.Cms.Commerce.ExchangeRateData)
```

Updates an existing exchange rate in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Base Currency ID
- * Exchange Currency ID
- * Effective Date
- Rate

Parameters

- `exchangeRateData`. ExchangeRateData to be updated.

Returns

Exchange rate data object.

```

Data Classes

ExchangeRateCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `ExchangeRateCriteria()`

  ```
  public ExchangeRateCriteria()
  ```

- `ExchangeRateCriteria(Ektron.Cms.Commerce.ExchangeRateProperty, EkEnumeration.OrderByDirection)`

  ```
  public ExchangeRateCriteria(Ektron.Cms.Commerce.ExchangeRateProperty orderByField,
  EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ExchangeRateProperty` are:

  - BaseCurrencyId
  - EffectiveDate
  - ExchangeCurrencyId
  - Rate

ExchangeRateData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `BaseCurrency`. Gets or sets the Currency Id for the base currency. This is the currency that is being used as the basis for the exchange rate. If you are converting from USD to AUD, USD is the base currency.

  ```
  public int BaseCurrencyId { set; get; }
  ```

- `ConvertPrice(decimal)`. Converts a pric ein the base currency to a price in the exchange currency using the rate defined.

  ```
  public decimal ConvertPrice(decimal basePrice)
  ```

- `EffectiveDate`. Gets or sets the date and time in which this rate becomes effective.

  ```
  public System.DateTime? EffectiveDate { set; get; }
  ```

- `ExchangeCurrencyId`. Gets or sets the Currency Id for the exchange currency. This is the currency that the currency amount is being converted to. If you are converting from USD to AUD, AUD is the exchange currency.

  ```
  public int ExchangeCurrencyId { set; get; }
  ```

- `ExchangeRateData`

  ```
  public ExchangeRateData()
  ```

- `ExchangeRateData(int, int, decimal, System.DateTime?)`

  ```
  public ExchangeRateData(int baseCurrencyId,
    int exchangeCurrencyId, decimal rate,
    System.DateTime? effectiveDate)
  ```

- `ExchangeCurrencyId`. Gets or sets the Currency Id for the exchange currency. This is the currency that the currency amount is being converted to. If you are converting from USD to AUD, AUD is the exchange currency.

```
public int ExchangeCurrencyId { set; get; }
```

- `Rate`. Gets or sets the actual exchange rate between to currencies. This is the rate applied to base currency to convert it to exchange currency.

```
public decimal Rate { set; get; }
```

- `Validate()`. Validates the ExchangeRate data object for saving. Returns a ValidationResult object with results.

```
public ValidationResults Validate()
```

InventoryManager

9.00 and higher

The class manages inventory in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.InventoryManager
```

Constructors

- `InventoryManager()`
- `InventoryManager(ApiAccessMode)`.

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.InventoryData)
```

Adds the inventory data to catalog entry item.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Entry ID
- * Units in Stock
- * Reorder Level
- Disable Inventory

Parameters

- `inventoryData`. Inventory data object to be added.

Returns

InventoryData object.

        }
     }
```

DecreaseStockLevel

```
DecreaseStockLevel(System.Int64,System.Int32)
```

To decrease the stock level based on the entry ID and quantity.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Entry ID
- * Quantity

Parameters

- `entryId`. ID of the catalog entry.
- `quantity`. Quantity of the catalog product.

.aspx code snippet

        }
    }
```

GetReorderLevel

```
GetReorderLevel(System.Int64)
```

Get the reorder level based on the entry ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Entry ID

Parameters

- `entryId`. ID of the catalog entry.

Returns

Returns the reorder level of entry.

.aspx code snippet

```
<ol class="formFields">

        <li class="clearfix">
        <ektronUI:Label ID="uxEntryidLabel" AssociatedControlID="uxEntryId"

Data Classes

InventoryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `InventoryCriteria()`

  ```
  public InventoryCriteria()
  ```

- `InventoryCriteria(Ektron.Cms.Commerce.InventoryProperty, EkEnumeration.OrderByDirection)`

  ```
  public InventoryCriteria(Ektron.Cms.Commerce.InventoryProperty orderByField,
  EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `InventoryProperty` are:

  - EntryId
  - EntryTitle
  - EntryType
  - ReorderLevel
  - UnitsInStock
  - UnitsOnOrder

InventoryData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `DisableEntryInventoryManagement`. Gets or sets the entry disable inventory management flag.

  ```
  public bool DisableEntryInventoryManagement { set; get; }
  ```

- `EntryId`. Gets or sets the ID of the catalog entry (product) that this inventory data represents.

  ```
  public long EntryId { set; get; }
  ```

- `EntryTitle`. Gets or sets the Title of the catalog entry(product) that this inventory data represents.

  ```
  public string EntryTitle { set; get; }
  ```

- `EntryType`. Gets or sets the Type of the catalog entry(product) that this inventory data represents.

  ```
  public EkEnumeration.CatalogEntryType EntryType { set; get; }
  ```

- `InventoryData()`

  ```
  public InventoryData()
  ```

- `InventoryData(long, int, int, int)`

  ```
  public InventoryData(long entryId, int unitsInStock, int unitsOnOrder, int
  reOrderlevel)
  ```

- `ReorderLevel`. Gets or sets the inventory level at which stock should be reordered.

  ```
  public int ReorderLevel { set; get; }
  ```

- `UnitsInStock`. Gets or sets the the number of units currently in stock for the product.

  ```
  public int UnitsInStock { set; get; }
  ```

- `UnitsOnOrder`. Gets or sets The number of units currently on order for this product. This is the number of units that the store has ordered to replenish inventory and NOT the number of units that are currently on order by customers.

  ```
  public int UnitsOnOrder { set; get; }
  ```

OrderManager

9.00 and higher

The class manages commerce orders in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.OrderManager
```

Constructors

- `OrderManager()`
- `OrderManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *SetTrackingNumber* on page 618
- *Update* on page 620

ApplyCoupon

```
ApplyCoupon(System.Int64,System.Int64)
```

Applies a coupon to a specific order.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Order ID
- * Coupon ID

Parameters

- `orderId`. ID of the order.
- `couponId`. ID of the coupon.

.aspx code snippet

```
<ol class="formFields">
     <li class="clearfix">

```

```
        }
    }
```

GetOrderPaymentList

```
GetOrderPaymentList(Ektron.Cms.Commerce.OrderPaymentCriteria)
```

Returns the list of order payment data.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Order Payment Property
- * Object Value

Parameters

- `criteria`. Criteria by which to retrieve orders.

Returns

List of Order Payment Data.

See *Criteria use for GetList methods* on page 156 for additional information.

- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Basket ID
- * Customer ID
- * Billing Address ID
- * Shipping Address ID
- * Shipping Method ID
- Special Instruction
- HTTP Host

Payment Method

- * Billing First Name
- * Billing Last Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Parameters

- `basketId`. ID of the basket.
- `customerId`. ID of the customer.
- `billingAddressId`. ID of billing address.
- `shippingAddressId`. ID of the shipping address.
- `shippingMethodId`. ID of the shipping method.
- `orderPayment`. PaymentMethod object.
- `specialInstructions`. Special instructions.
- `httpHost`. Host URL.

Returns

Placed OrderData.

        }
     }
```

SetHold

```
SetHold(System.Int64)
```

Sets an order to OnHold.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Order ID

Parameters

- `orderId`. ID of the order.

.aspx code snippet

```
<ol class="formFields">
     <li class="clearfix">

- Status
- Subtotal
- Total
- TotalCoupons
- TotalHandling
- TotalShipping
- TotalShippingTaxes
- TotalTaxes
- VisitorId
- WorkflowId

OrderData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `BillingAddressId`

  ```
  public long BillingAddressId { set; get; }
  ```

- `ClientIP`

  ```
  public string ClientIP { set; get; }
  ```

- `Coupons`

  ```
  public System.Collections.Generic.List<CouponData> Coupons { set; get; }
  ```

- `CouponTotal`

  ```
  public decimal CouponTotal { set; get; }
  ```

- `CouponUsed`

  ```
  public bool CouponUsed { set; get; }
  ```

- `Currency`

  ```
  public Ektron.Cms.Commerce.CurrencyData Currency { set; get; }
  ```

- `Customer`

  ```
  public Ektron.Cms.Commerce.CustomerData Customer { set; get; }
  ```

- CustomerType

```
public EkEnumeration.CustomerType CustomerType { set; get; }
```

- DateCompleted

```
public System.DateTime DateCompleted { set; get; }
```

- DateCreated

```
public System.DateTime DateCreated { set; get; }
```

- DateRequired

```
public System.DateTime DateRequired { set; get; }
```

- HandlingTotal

```
public decimal HandlingTotal { set; get; }
```

- HasTangibleItems

```
public bool HasTangibleItems { set; get; }
```

- HttpHost

```
public string HttpHost { set; get; }
```

- Id

```
public long Id { set; get; }
```

- OrderTotal. Gets or sets the Order Total.

```
public decimal OrderTotal { set; get; }
```

- Parts

```
public System.Collections.Generic.List<OrderPartData> Parts { get; }
```

- Payments

```
public System.Collections.Generic.List<OrderPaymentData> Payments { set; get; }
```

- ShippingTaxTotal. Gets or sets the total shipping tax charged for order.

```
public decimal ShippingTaxTotal { set; get; }
```

- ShippingTotal. Gets or sets the total shipping charged for order.

```
public decimal ShippingTotal { set; get; }
```

- SpecialInstructions

```
public string SpecialInstructions { set; get; }
```

- StageId

```
public int StageId { set; get; }
```

- StageName

```
public string StageName { set; get; }
```

- Status

```
public EkEnumeration.OrderStatus Status { set; get; }
```

- Subtotal. Gets or sets the Order SubTotal.

```
public decimal Subtotal { set; get; }
```

- TaxTotal. Gets or sets the total tax amount for the order.

```
public decimal TaxTotal { set; get; }
```

- `VisitorId`

```
public string VisitorId { set; get; }
```

- `WorkflowId`

```
public System.Guid WorkflowId { set; get; }
```

OrderPaymentCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `OrderPaymentCriteria()`

```
public OrderPaymentCriteria()
```

- `OrderPaymentCriteria(Ektron.Cms.Commerce.OrderPaymentProperty, EkEnumeration.OrderByDirection)`

```
public OrderPaymentCriteria(Ektron.Cms.Commerce.OrderPaymentProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `OrderPaymentProperty` are:

- AuthReceived
- CapturedDate
- CurrencyId
- Id
- Last4Digits
- OrderId
- PaymentDate
- PaymentGateway
- PaymentTotal
- PaymentType
- RecurringTransactionId
- SettledDate
- TransactionId
- VoidedDate

PaymentMethod

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `BillingAddress`. Gets or sets the billing address of the party being authorized.

```
public virtual Ektron.Cms.Commerce.AddressData BillingAddress { set; get; }
```

- `BillingFirstName`. Gets or sets the first name of the billable party.

```
public virtual string BillingFirstName { set; get; }
```

- `BillingLastName`. Gets or sets the last name of the billable party.

```
public virtual string BillingLastName { set; get; }
```

- `GetPayment(System.Collections.Specialized.NameValueCollection)`. Returns a PaymentMethod based upon NameValueCollection. This would be used by the checkout control to get the PaymentMethod posted back from the page.

```
public virtual Ektron.Cms.Commerce.PaymentMethod
  GetPayment(System.Collections.Specialized.NameValueCollection postBackData)
```

- `PaymentMethod()`

```
public PaymentMethod()
```

PackageManager

9.00 and higher

The class manages commerce packages in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.PackageManager
```

Constructors

- `PackageManager()`
- `PackageManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the currently logged-in user identifier.

Methods

- *Add* below
- *Delete* on page 631
- *GetItem* on page 633
- *GetList* on page 635
- *Update* on page 638

Add

```
Add(Ektron.Cms.Commerce.PackageData)
```

Adds a package to the CMS. The Package.Id property is populated with the Package's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

GetList

```
GetList(Ektron.Cms.Commerce.PackageCriteria)
```

Retrieves a list of Packages.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Package Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter package being retrieved.

Returns

List of packages meeting criteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

Data Classes

PackageCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `PackageCriteria()`

  ```
  public PackageCriteria()
  ```

- `PackageCriteria(Ektron.Cms.Commerce.PackageProperty, EkEnumeration.OrderByDirection)`

  ```
  public PackageCriteria(Ektron.Cms.Commerce.PackageProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `PackageProperty` are:

  - Height
  - Id
  - Length
  - LinearUnit
  - MaxWeight
  - Name
  - WeightUnit
  - Width

PackageData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Dimensions`. Gets or sets the dimensions of the package.

  ```
  public Ektron.Cms.Commerce.Dimensions Dimensions { set; get; }
  ```

- `Id`. Gets or sets the Id of the package.

  ```
  public long Id { set; get; }
  ```

- `MaxWeight`. Gets or sets the maximum weight capacity of the package.

  ```
  public Ektron.Cms.Commerce.Weight MaxWeight { set; get; }
  ```

- `Name`. Gets or sets the name of the package.

```
public string Name { set; get; }
```

- `PackageData()`

```
public PackageData()
```

- `PackageData(string, Ektron.Cms.Commerce.Dimensions, Ektron.Cms.Commerce.Weight)`

```
public PackageData(string name, Ektron.Cms.Commerce.Dimensions dimensions,
Ektron.Cms.Commerce.Weight maxWeight)
```

- `PackageData(string, Ektron.Cms.Commerce.Dimensions, Ektron.Cms.Commerce.Weight, long)`

```
public PackageData(string name, Ektron.Cms.Commerce.Dimensions dimensions,
Ektron.Cms.Commerce.Weight maxWeight, long id)
```

PasswordHistoryManager

9.00 and higher

The class manages password histories.

Namespace

```
Ektron.Cms.Framework.Commerce.PasswordHistoryManager
```

Constructors

- `PasswordHistoryManager()`
- `PasswordHistoryManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.PasswordHistoryData)
```

Adds a password history to CMS. The PasswordHistory.Id property is populated with the new password history's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Password Hash
- * Change Date Time

Parameters

- `PasswordHistoryData`. PasswordHistoryData object to add.

Returns

PasswordHistoryData object.

        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a password history from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Password History ID

Parameters

- `id`. ID of PasswordHistoryData object to delete.

```

GetList

```
GetList(Ektron.Cms.Commerce.PasswordHistoryCriteria)
```

Retrieves a list of password history data objects based upon the supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Password History Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter password history being retrieved.

Returns

List of PasswordHistoryData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

GetRecentPasswords

```
GetRecentPasswords(System.Int64,System.Int32)
```

Retrieves the last N number of passwords for a user.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Number

Parameters

- `userId`. The user ID for whom to retrieve the recent passwords.
- `number`. The number of recent passwords to get.

Returns

List of PasswordHistoryData objects.

MatchesRecentPassword

```
MatchesRecentPassword(System.Int64,System.String,System.Int32)
```

Returns whether the password matches the user's last N number of passwords.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Password Hash
- * Number

Parameters

- `userId`. The user ID that matches the recent passwords.
- `passwordHash`. Hashed password to match.
- `number`. The number of recent passwords to look in.

Returns

Returns true if a password matches.

```

```
        }
    }
```

Purge

```
Purge(System.Int64,System.Int32)
```

Deletes a password history from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Number

Parameters

- `userId`. ID of user to delete password history.
- `number`. Deletes a password history except a given number of recently added passwords.

Data Classes

PasswordHistoryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `PasswordHistoryCriteria()`

  ```
  public PasswordHistoryCriteria()
  ```

- `PasswordHistoryCriteria (Ektron.Cms.Commerce.PasswordHistoryProperty, EkEnumeration.OrderByDirection)`

```
public
  PasswordHistoryCriteria(Ektron.Cms.Commerce.PasswordHistoryProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `PasswordHistoryProperty` are:

- ChangeDate
- Id
- PasswordHash
- UserId

PasswordHistoryData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `ChangeDate`

  ```
  public System.DateTime ChangeDate { set; get; }
  ```

- `Id`

  ```
  public long Id { set; get; }
  ```

- `PasswordHash`

  ```
  public string PasswordHash { set; get; }
  ```

- `PasswordHistoryData()`

  ```
  public PasswordHistoryData()
  ```

- `PasswordHistoryData(long, string)`

  ```
  public PasswordHistoryData(long userId, string passwordHash)
  ```

- `UserId`

  ```
  public long UserId { set; get; }
  ```

- `Validate`

  ```
  public ValidationResults Validate()
  ```

PaymentGatewayManager

9.00 and higher

The class manages the commerce payment gateway in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.PaymentGatewayManager
```

Constructors

- `PaymentGatewayManager()`
- `PaymentGatewayManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 668
- *GetDefault* on page 669
- *GetItem* on page 671
- *GetList* on page 673
- *SetDefault* on page 676
- *Update* on page 678

Add

```
Add(Ektron.Cms.Commerce.PaymentGatewayData)
```

Adds a payment gateway to the CMS. The PaymentGateway.Id property is populated with the payment gateway's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- User ID
- Password
- Is Default
- Allow Check Payments

Parameters

- `gatewayData`. PaymentGatewayData object to add.

Returns

PaymentGatewayData object.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Delete the existing payment gateway.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `gatewayId`. ID of the gateway to delete.

.aspx code snippet

```
<ol class="formFields">
   <li class="clearfix">
        <ektronUI:Label ID="uxPaymentGatewayIdLabel"
AssociatedControlID="uxPaymentGatewayId" CssClass="span-3 last" runat="server" Text="*

        }
    }
```

GetList

```
GetList(Ektron.Cms.Commerce.PaymentGatewayCriteria)
```

Retrieves a list of payment gateways.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Payment Gateway Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter payment gateway being retrieved.

Returns

List of payment gateways meeting criteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Commerce.PaymentGatewayData)
```

Update the existing PaymentGatewayData object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Name
- User ID
- Password
- Is Default

Parameters

- `gatewayData`. PaymentGatewayData object to update.

Returns

Payment gateway data object.

```

Data Classes

PaymentGatewayCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `PaymentGatewayCriteria()`

  ```
  public PaymentGatewayCriteria()
  ```

- `PaymentGatewayCriteria (Ektron.Cms.Commerce.PaymentGatewayProperty, EkEnumeration.OrderByDirection)`

  ```
  public PaymentGatewayCriteria(Ektron.Cms.Commerce.PaymentGatewayProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

Accepted fields for the `PaymentGatewayProperty` are:

- AllowsCheckPayments
- Id
- IsDefault
- Name

PaymentGatewayData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `AllowsCheckPayments`. Gets or sets whether the payment gateway accepts check payments. * True = the payment gateway accepts check payments * False = the payment gateway does not accept check payments

  ```
  public bool AllowsCheckPayments { set; get; }
  ```

- `AllowsCreditCardPayments`. Gets or sets whether the payment gateway accepts credit cards. * True = the payment gateway accepts credit cards * False = the payment gateway does not accept credit cards

  ```
  public bool AllowsCreditCardPayments { set; get; }
  ```

- `CustomFieldOne`. Gets or sets the first custom field a payment gateway might require. Each type of payment gateway provider accepts configuration parameters. For example, Authorize.NET requires a username and password while PayFlow requires a username, password, vendor, and partner. So, if you were creating an object for PayFlow, you would enter the required vendor information in this property. If your payment gateway does not require additional information, leave blank.

  ```
  public string CustomFieldOne { set; get; }
  ```

- `CustomFieldTwo`. Gets or sets the second custom field a payment gateway might require. Each type of payment gateway provider accepts configuration parameters. For example, Authorize.NET requires a username and password while PayFlow requires a username, password, vendor, and partner. So, if you were creating an object for PayFlow, you would enter the required partner information in this property. If your payment gateway does not require additional information, leave blank.

  ```
  public string CustomFieldTwo { set; get; }
  ```

- `Id`. Gets or sets the Ektron CMS ID for the payment gateway data object. You cannot set the ID of a newly created data object. The ID of an object is set internally by Ektron CMS during the creation (Add) process. You can set the ID of the object for updating purposes.

  ```
  public long Id { set; get; }
  ```

- `IsCustom`. Gets or sets whether this payment gateway is a custom payment gateway or one that comes pre-installed with Ektron CMS. Set this property to

true when creating a custom payment gateway. * True = is a custom payment gateway * False = is not a custom payment gateway

```
public bool IsCustom { set; get; }
```

- `IsDefault`. Gets or sets whether this payment gateway is the default in Ektron CMS. * True = default payment gateway * False = not the default payment gateway.

```
public bool IsDefault { set; get; }
```

- `Name`. Gets or sets the name associated with the payment gateway. For example, if you were adding information for a payment gateway company called EkPay, enter "EkPay" for this property. When creating a payment gateway, a name value is required.

```
public string Name { set; get; }
```

- `Password`. Gets or sets the password associated with a payment gateway. This is not an Ektron CMS password. This information is supplied by the payment gateway.

```
public string Password { set; get; }
```

- `PaymentGatewayData()`

```
public PaymentGatewayData()
```

- `PaymentGatewayData(string, string, string, string, string, bool, bool, bool)`

```
public PaymentGatewayData(string name, string user,
  string password, string custom1, string custom2,
  bool isDefault, bool allowsCreditCards, bool allowsChecks)
```

- `UserId`. Gets or sets the user ID associated with a payment gateway. This is not an Ektron CMS user ID. This information is supplied by the payment gateway.

```
public string UserId { set; get; }
```

- `Validate()`. Validates the PaymentGatewayData object is valid for saving. Returns a ValidationResult object with any validation errors.

```
public ValidationResults Validate()
```

ProductTypeManager

9.00 and higher

The class manipulates the catalog's product type data in CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.ProductTypeManager
```

Constructors

- `ProductTypeManager()`
- `ProductTypeManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.ProductTypeData)
```

Adds a product type into the CMS. The ProductTypeData.Id property is populated with the product type's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- Description
- Class

Parameters

- `productType`. ProductTypeData object.

Returns

Returns the added ProductTypeData object.

.aspx code snippet

```
<ol class="formFields">

        }
    }
```

GetItem

```
GetItem(System.Int64,System.Boolean)
```

Retrieves the single product type by its ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Product Type ID
- * Include Attributes

Parameters

- `productTypeId`. The ID of the product type to get.
- `withAttributes`. If it is true, it will fetch attributes; otherwise not.

Returns

Returns ProductTypeData object.

    }
```

GetList (folder ID)

```
GetList(System.Int64)
```

Retrieves a list of ProductTypeData object by folder ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID

Parameters

- `folderId`. ID of the Folder that uses product types.

Returns

Returns a list of ProductTypeData objects.

Update

```
Update(Ektron.Cms.Commerce.ProductTypeData)
```

Updates an existing product type.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Product Type ID
- Type
- Description

Parameters

- `productType`. ProductTypeData object.

Returns

Returns the updated ProductTypeData object.

Data Classes

ProductTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `ProductTypeCriteria()`

```
public ProductTypeCriteria()
```

- `ProductTypeCriteria(Ektron.Cms.Commerce.ProductTypeProperty, EkEnumeration.OrderByDirection)`

```
public ProductTypeCriteria(Ektron.Cms.Commerce.ProductTypeProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `ProductTypeProperty` are:

- ConfigClass
- DateCreated
- DefaultXslt
- Description
- EditorFirstName
- EditorLastName
- EditXslt
- FieldList
- Is
- LastEditDate
- LogicalPath
- PackageDisplayXslt
- PackageXslt
- PhysicalPath
- SaveXslt
- SecondaryConfig
- SubscriptionProvider
- Title
- UserId
- XmlAdvConfig
- XmlNamespace
- XmlSchema
- Xslt1
- Xslt2
- Xslt3
- Xslt4
- Xslt5

ProductTypeData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- Attributes

```
public System.Collections.Generic.List<ProductTypeAttributeData>
  Attributes { set; get; }
```

- DefaultThumbnails

```
public System.Collections.Generic.List<ThumbnailDefaultData>
  DefaultThumbnails { set; get; }
```

- EntryClass

```
public EkEnumeration.CatalogEntryType EntryClass { set; get; }
```

- SubscriptonProvider

```
public string SubscriptionProvider { set; get; }
```

- Title

```
public new string Title { set; get; }
```

RecommendationManager

9.00 and higher

The class manipulates the recommended items to the catalog entry.

Namespace

```
Ektron.Cms.Framework.Commerce.RecommendationManager
```

Constructors

- `RecommendationManager()`
- `RecommendationManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Delete* below
- *DeleteByEntry* on page 702
- *GetItem* on page 704
- *GetList* on page 706
- *UpdateCrossSell* on page 709
- *UpdateUpSell* on page 711

Delete

```
Delete(System.Int64)
```

Deletes a recommendation.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Recommendation ID

Parameters

- `recommendationId`. ID of recommendation to delete.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxRecommendationIdLabel"

```

GetList

```
GetList(System.Int64,System.Int64,Ektron.Cms.Common.EkEnumeration.RecommendationType)
```

Retrieves a list of RecommendationItemData objects based upon the supplied criteria.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Entry ID
- * Entry Language
- * Recommendation Type

Parameters

- `entryId`. Catalog entry ID.
- `entryLanguage`. Catalog entry language.
- `type`. Recommendation type.

Returns

Returns list of RecommendationItemData which are matches the criteria.

```

Data Classes

RecommendationItemData

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `EntryLanguage`. Gets or sets the language of the entry.

  ```
  public long EntryLanguage { set; get; }
  ```

- `EntryType`. Gets or sets the entry type associated with this recommendation.

  ```
  public EkEnumeration.CatalogEntryType EntryType { set; get; }
  ```

- `Html`. Gets or sets the HTML of the recommendation.

  ```
  public string Html { set; get; }
  ```

- `Image`. Gets or sets the image associated with the recommendation.

  ```
  public string Image { set; get; }
  ```

- `ImageThumbnail`. Gets or sets the image thumbnail associated with the recommendation.

  ```
  public string ImageThumbnail { set; get; }
  ```

- `Media`

```
public Ektron.Cms.MediaGalleryData Media { set; get; }
```

- `Pricing`. The entry pricing, including currencies and quantity. Returns PricingData of the catalog entry.

```
public Ektron.Cms.Commerce.PricingData Pricing { set; get; }
```

- `Quicklink`. Gets or sets the quicklink of the recommendation.

```
public string Quicklink { set; get; }
```

- `RecommendationItemData()`

```
public RecommendationItemData()
```

- `RecommendationItemData(long, long, long, EkEnumeration.RecommendationType)`

```
public RecommendationItemData(long id, long entryId,
   long entryLanguage, EkEnumeration.RecommendationType
   recommendationType)
```

- `Summary`. Gets or sets the summary of the recommendation.

```
public string Summary { set; get; }
```

- `Title`. Gets or sets the title of the recommendation.

```
public string Title { set; get; }
```

- `Type`. Gets or sets the type of recommendation.

```
public EkEnumeration.RecommendationType Type { set; get; }
```

RecommendationType

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `CrossSell`

```
Public Const CrossSell
   As Ektron.Cms.Common.EkEnumeration.RecommendationType = 0
```

- `Upsell`

```
public Const Upsell
  As Ektron.Cms.Common.EkEnumeration.RecommendationType = 1
```

RegionManager

9.00 and higher

The class manages regions in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.RegionManager
```

Constructors

- `RegionManager()`
- `RegionManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.RegionData)
```

Adds a region to the CMS. The Region.Id property is populated with the new regions ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Country ID
- * Code
- Enabled

Parameters

- `regionData`. RegionData object to add.

CanDelete

```
CanDelete(System.Int64)
```

Checks to see whether a region can be deleted.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Region ID

Parameters

- `regionId`. ID of Region to delete.

Returns

True if the region can be deleted safely.

.aspx code snippet

```

```
        }
    }
```

Data Classes

RegionCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `RegionCriteria()`

  ```
  public RegionCriteria()
  ```

- `RegionCriteria(Ektron.Cms.Commerce.RegionProperty, EkEnumeration.OrderByDirection)`

  ```
  public RegionCriteria(Ektron.Cms.Commerce.RegionProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `RegionProperty` are:

  - AlphaCode
  - CountryId
  - Id
  - IsEnabled
  - Name

RegionData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Code`. Gets or sets the code of the region. This is typically an abbreviation for the name of the region. For example, if you add New Hampshire as a region, you would enter "NH" for this property. Each region must have its own unique code. You cannot have more than one region with the same code. This property is required when creating an region data object.

  ```
  public string Code { set; get; }
  ```

- `CountryId`. Gets or sets the ID of the country to which the region belongs. For example, if you are adding a region to the United States, you would enter "840" for this property. This property is required when creating an region data object.

  ```
  public long CountryId { set; get; }
  ```

- `Enabled`. Gets or sets whether or not the region is enabled for use.

```
public bool Enabled { set; get; }
```

- `Id`. Gets or sets the ID of the region.

```
public long Id { set; get; }
```

- `Name`. Gets or sets the name of the region. For example, if the region is a US state, you might enter "New Hampshire" for this property. This property is required when creating an region data object.

```
public string Name { set; get; }
```

- `RegionData()`

```
public RegionData()
```

- `RegionData(string, long, string, bool)`

```
public RegionData(string name, long countryId, string code, bool enabled)
```

- `ToString()`. Returns Name of Region.

```
public override string ToString()
```

- `Validate()`. Validates the RegionData object is valid for saving. Returns a ValidationResult object with any validation errors.

```
public ValidationResults Validate()
```

ShippingMethodManager

9.00 and higher

The class manages shipping methods in CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.ShippingMethodManager
```

Constructors

- `ShippingMethodManager()`
- `ShippingMethodManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 732
- *GetItem* on page 734
- *GetList* on page 736
- *Update* on page 739

Add

```
Add(Ektron.Cms.Commerce.ShippingMethodData)
```

Adds a shipping method to the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Shipping Method Name
- * Provider Service
- * Display Order
- * Is Active

Parameters

- `shippingMethodData`. ShippingMethodData object to add.

Returns

ShippingMethodData object.

.aspx code snippet

```
<ol class="formFields">

```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            ShippingMethodManager shippingMethodManager = new ShippingMethodManager();
            ShippingMethodData shippingMethodData=new ShippingMethodData();
            shippingMethodData.Name = uxName.Text;
            shippingMethodData.ProviderService =uxProviderService.Text;
            shippingMethodData.DisplayOrder = int.Parse(uxDisplayOrder.Text);
            shippingMethodData.IsActive = uxIsActive.Checked;

            shippingMethodData = shippingMethodManager.Add(shippingMethodData);
            MessageUtilities.UpdateMessage(uxMessage, "shippingMethodData is added with
Id " + shippingMethodData.Id, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a shipping method from CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `shippingMethodId`. ID of the shipping method to delete.

.aspx code snippet

```
<ol class="formFields">

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves the single shipping method by shipping method ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `shippingMethodId`. ID of the shipping method to retrieved.

Returns

ShippingMethodData object.

        }
    }
```

GetList

```
GetList(Ektron.Cms.Commerce.ShippingMethodCriteria)
```

Retrieves a list of shipping methods.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Shipping Method Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter shipping methods being retrieved.

Returns

List of shipping methods meeting criteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Commerce.ShippingMethodData)
```

Updates an existing shipping method in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Shipping Method Name
- * Provider Service
- * Display Order
- * Is Active

Parameters

- `shippingMethodData`. ShippingMethodData object to save.

Returns

ShippingMethodData object.

Data Classes

ShippingMethodCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `ShippingMethodCriteria()`

  ```
  public ShippingMethodCriteria()
  ```

- `ShippingMethodCriteria (Ektron.Cms.Commerce.ShippingMethodProperty, EkEnumeration.OrderByDirection)`

  ```
  public ShippingMethodCriteria(Ektron.Cms.Commerce.ShippingMethodProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ShippingMethodProperty` are:

  - DisplayOrder
  - Id
  - IsActive
  - Name
  - ProviderSearch

ShippingMethodData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `DisplayOrder`. Gets or sets the display order for this shipping method.

  ```
  public int DisplayOrder { set; get; }
  ```

- `IsActive`. Gets or sets whethe ror not the Shipping Method is Active.

  ```
  public bool IsActive { set; get; }
  ```

- `ShippingMethodsData()`

  ```
  public ShippingMethodData()
  ```

TaxClassManager

9.00 and higher

The class manages tax class in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.TaxClassManager
```

Constructors

- `TaxClassManager()`
- `TaxClassManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 745
- *GetItem* on page 746
- *GetList* on page 748
- *IsUsed* on page 750
- *Update* on page 752

Add

```
Add(Ektron.Cms.Commerce.TaxClassData)
```

Adds a tax class to the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tax Class Name

Parameters

- `taxClassData`. TaxClassData object to add.

.aspx code snippet

```
<ol class="formFields">
<li class="clearfix">
    <ektronUI:Label ID="uxNameLabel" AssociatedControlID="uxName" CssClass="span-6 last"
runat="server" Text="* Tax Class Name:" />

ValidationGroup="RegisterValidationGroup" Text="" />
</li>
<div class="ektronTopSpace"></div>
<li class="clearfix">
    <ektronUI:Button ID="uxSubmit" runat="server" OnClick="uxSubmit_Click"
Text="Add"></ektronUI:Button>
    <ektronUI:Label ID="uxRequiredLabel" CssClass="span-6" runat="server" Text="* -
Required" />
</li>
</ol>
<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

.aspx.cs code-behind namespace

```
using Ektron.Cms.Framework.Commerce;
using Ektron.Cms.Commerce;
using Ektron.Cms;
using Ektron.Site.Developer;
using Ektron.Cms.Framework.UI.Controls.EktronUI;
```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            TaxClassManager taxClassManager = new TaxClassManager();
            TaxClassData taxClassData = new TaxClassData();
            if (uxName.Text.ToString().Trim() != "")
            {
                taxClassData.Name = uxName.Text;
                taxClassData = taxClassManager.Add(taxClassData);
```

```
                MessageUtilities.UpdateMessage(uxMessage, "TaxClassData is added with Id
" + taxClassData.Id, Message.DisplayModes.Success);
            }
            else
            {
                MessageUtilities.UpdateMessage(uxMessage, "Tax Class Name should not be
empty ", Message.DisplayModes.Error);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a tax class from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of TaxClass to delete.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxTaxClassIdLabel" AssociatedControlID="uxTaxClassId"

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves a tax class by ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of taxClass to retrieve.

Returns

TaxClassData object.

    }
```

GetList

```
GetList(Ektron.Cms.Commerce.TaxClassCriteria)
```

Retrieves a list of tax classes.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tax Class Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter taxClass being retrieved.

Returns

List of TaxClassData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

Data Classes

TaxClassCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `TaxClassCriteria()`

  ```
  public TaxClassCriteria()
  ```

- `TaxClassCriteria(Ektron.Cms.Commerce.TaxClassProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaxClassCriteria(Ektron.Cms.Commerce.TaxClassProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaxClassProperty` are:

  - Id
  - Name

TaxClassData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Id`. Gets or sets the name of the tax class.

  ```
  public long Id { set; get; }
  ```

- `Name`. Gets or sets the name of the tax class.

  ```
  public string Name { set; get; }
  ```

- `TaxClassData()`

  ```
  public TaxClassData()
  ```

- `TaxClassData(string)`

  ```
  public TaxClassData(string name)
  ```

- `TaxClassData(string, long)`

  ```
  public TaxClassData(string name, long id)
  ```

TaxRateManager

9.00 and higher

The class manages commerce tax rates in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.TaxRateManager
```

Constructors

- `TaxRateManager()`
- `TaxRateManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Commerce.TaxRateData)
```

Adds a tax rate to the CMS. The Tax.Id property is populated with the new Tax's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Rate
- * Tax Class ID
- * Type ID
- * Type Item ID

Parameters

- `taxRateData`. TaxRateData object to add.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a tax rate from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `taxRateId`. ID of tax to delete.

.aspx code snippet

        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetApplicableTaxRate

```
GetApplicableTaxRate
(Ektron.Cms.Commerce.AddressData,Ektron.Cms.Commerce.AddressData,System.Int64)
```

Returns the applicable tax rate for the supplied addresses and tax class.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tax Class ID

Shipping From Address

- * Shipping From Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Shipping To Address

- * Shipping To Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Parameters

- `shipFromAddress`. Address where the products are coming from.
- `shipToAddress`. Address where products are going.
- `taxClassId`. The taxClass for which to retrieve a rate.

    }
```

GetApplicableTaxRateList

```
GetApplicableTaxRateList
(Ektron.Cms.Commerce.AddressData,Ektron.Cms.Commerce.AddressData)
```

Returns a list of applicable tax rates for the supplied addresses. There is at most one rate for each available tax class for the specified addresses.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

Shipping From Address

- * Shipping From Address Name
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID

Shipping To Address

- * Shipping To Address Name
- * Address Line 1
- * City
- * Region ID

- * Postal Code
- * Country ID

Parameters

- `shipFromAddress`. Address where the products are coming from.
- `shipToAddress`. Address where products are going.

        }
    }
```

Update

```
Update(Ektron.Cms.Commerce.TaxRateData)
```

Updates an existing tax rate in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- ID
- * Rate
- * Tax Class ID
- * Type ID
- * Type Item ID

Parameters

- `taxRateData`. TaxRateData object to save.

Data Classes

TaxRateCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `TaxRateCriteria()`

  ```
  public TaxRateCriteria()
  ```

- `TaxRateCriteria(Ektron.Cms.Commerce.TaxRateProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaxRateCriteria(Ektron.Cms.Commerce.TaxRateProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaxRateProperty` are:

  - Country
  - CountryId
  - PostalCode
  - Rate
  - RateId
  - Region
  - RegionId
  - TaxClassId

- TaxClassName
- TaxTypeId
- TaxTypeItemId
- TaxTypeName
- TaxTypePreference

TaxRateData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Id`. Gets or sets the ID of the TaxRate.

  ```
  public long Id { set; get; }
  ```

- `Rate`. Gets or sets the actual rate for this TaxRate object. Should be entered in decimal format - i.e. .075 for 7.5%.

  ```
  public decimal Rate { set; get; }
  ```

- `TaxClassId`. Gets or sets the ID of the tax class that this rate applies to.

  ```
  public long TaxClassId { set; get; }
  ```

- `TaxRateData()`

  ```
  public TaxRateData()
  ```

- `TaxRateData(long, long, decimal)`

  ```
  public TaxRateData(long typeId, long typeItemId,
    long taxClassId, decimal rate)
  ```

- `TaxRateData(long, long, decimal, long)`

  ```
  public TaxRateData(long typeId, long typeItemId,
    long taxClassId, decimal rate, long id)
  ```

- `TypeId`. Gets or sets the type of the Tax Rate.

  ```
  public long TypeId { set; get; }
  ```

- `TypeItemId`. Gets or sets the ID of the tax type object this tax rate applies to. For instance, for a region sales tax, TypeItemId would be the ID of the corresponding region.

  ```
  public long TypeItemId { set; get; }
  ```

TaxTypeManager

9.00 and higher

The class manages commerce tax types in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.TaxTypeManager
```

Constructors

- `TaxTypeManager()`
- `TaxTypeManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 782
- *GetItem* on page 783
- *GetList* on page 785
- *Update* on page 788

Add

```
Add(Ektron.Cms.Commerce.TaxTypeData)
```

Adds a tax type to the CMS. The TaxType.Id property is populated with the new tax type's ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tax Type Name
- * Precedence

Parameters

- `taxTypeData`. TaxTypeData object to add.

Returns

TaxTypeData object.

.aspx code snippet

```
<ol class="formFields">
<li class="clearfix">

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a tax type from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of tax type to delete.

.aspx code snippet

```
<ol class="formFields">

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves a tax type by ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

`id`. ID of tax type to retrieve.

Returns

TaxTypeData object.

.aspx code snippet

```

    }
```

GetList

```
GetList(Ektron.Cms.Commerce.TaxTypeCriteria)
```

Retrieves a list of Tax Types.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tax Type Property
- * Object Value

Parameters

- `criteria`. Criteria by which to filter tax type being retrieved.

Returns

List of TaxTypeData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Data Classes

TaxTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `TaxTypeCriteria()`

  ```
  public TaxTypeCriteria()
  ```

- `TaxTypeCriteria(Ektron.Cms.Commerce.TaxTypeProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaxTypeCriteria(Ektron.Cms.Commerce.TaxTypeProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaxTypeProperty` are:

  - Id
  - Name
  - Precedence

TaxTypeData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Id`. Gets or sets the name of the tax class.

  ```
  public long Id { set; get; }
  ```

- `Name`. Gets or sets the name of the tax class.

  ```
  public string Name { set; get; }
  ```

- `Precedence`. Gets or sets the precedence of the tax class. This is the priority order in which it will be applied. For example, if type "Postal Code Sales Tax is priority 1" and it exists for an address it will be used over type "State Sales Tax" which is priority 2.

  ```
  public int Precedence { set; get; }
  ```

- `TaxTypeData()`

  ```
  public TaxTypeData()
  ```

- `TaxTypeData(string, int)`

  ```
  public TaxTypeData(string name, int precedence)
  ```

- `TaxTypeData(string, int, long)`

```
public TaxTypeData(string name, int precedence, long id)
```

WarehouseManager

9.00 and higher

The class manages commerce warehouses in the CMS.

Namespace

```
Ektron.Cms.Framework.Commerce.WarehouseManager
```

Constructors

- `WarehouseManager()`
- `WarehouseManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 795
- *GetDefault* on page 797
- *GetItem* on page 799
- *GetList* on page 801
- *SetDefault* on page 804
- *Update* on page 806

Add

```
Add(Ektron.Cms.Commerce.WarehouseData)
```

Adds a warehouse to the CMS.The WarehouseData.Id property is populated with the new Warehouse ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Name
- Is Default Warehouse

Parameters

- `warehouseData`. Warehouse data object to add.

Returns

WarehouseData object added.

- * Object Value

Parameters

- `criteria`. Criteria by which to filter warehouse being retrieved.

Returns

List of WarehouseCriteria filters.

See *Criteria use for GetList methods* on page 156 for additional information.

    }
```

SetDefault

```
SetDefault(System.Int64)
```

Marks the existing warehouse as default warehouse.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Warehouse ID

Parameters

- `warehouseId`. ID of the warehouse to become default warehouse.

.aspx code snippet

    }
```

Update

```
Update(Ektron.Cms.Commerce.WarehouseData)
```

Updates the existing warehouse.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Warehouse ID
- * Address Line 1
- * City
- * Region ID
- * Postal Code
- * Country ID
- * Name
- Is Default Warehouse

Parameters

- `warehouseData`. WarehouseData object to update.

Returns

WarehouseData object updated.

Data Classes

WarehouseCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Commerce
```

Constructors

- `WarehouseCriteria()`

  ```
  public WarehouseCriteria()
  ```

- `WarehouseCriteria(Ektron.Cms.Commerce.WarehouseProperty, EkEnumeration.OrderByDirection)`

  ```
  public WarehouseCriteria(Ektron.Cms.Commerce.WarehouseProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `WarehouseProperty` are:

  - AddressCompanyName
  - AddressId
  - AddressLine1
  - AddressLine2
  - City
  - CounteryEnabled
  - CountryId

- CountryLongIsoCode
- CountryName
- CountryShortIsoCode
- Id
- IsCommercial
- IsDefault
- IsValidated
- Name
  phone
- PostalCode
- RegionAlphaCode
- RegionEnabled
- RegionId
- RegionName

WarehouseData

Namespace

```
Ektron.Cms.Commerce
```

Properties

- `Address`. Gets or sets the address of this Warehouse.

  ```
  public Ektron.Cms.Commerce.AddressData Address { set; get; }
  ```

- `Id`. Gets or sets Id of Address.

  ```
  public long Id { set; get; }
  ```

- `IsDefaultWarehouse`. Gets or sets the IsDefaultWarehouse status property for the warehouse. If true, this warehouse is the default warehouse for the system.

  ```
  public bool IsDefaultWarehouse { set; get; }
  ```

- `Name`. Gets or sets the name of this Warehouse.

  ```
  public string Name { set; get; }
  ```

- `WarehouseData()`

  ```
  public WarehouseData()
  ```

- `WarehouseData(string, Ektron.Cms.Commerce.AddressData)`

  ```
  public WarehouseData(string warehouseName,
    Ektron.Cms.Commerce.AddressData address)
  ```

Community

8.50 and higher

The Community manager category manages social media aspects of a website and has the following classes:

- *CommunityGroupManager* on the next page. Manages groups of users.
- *FavoriteManager* on page 867. Manages a list of Ektron CMS content and external Web links (URLs) that a user has designated as favorite content.
- *FavoriteTaxonomyManager* on page 882. Manages user favorite taxonomies.
- *FlagManager* on page 896. Manages flags that are assigned to content to provide feedback.
- *FriendsManager* on page 910. Manages colleague connections (friends).
- *FriendsTaxonomyManager* on page 939. Manages taxonomies of colleague connections (friends).
- *MessageBoardManager* on page 953. Manages items that are posted on a message board.
- *MicromessageManager* on page 979. Manages user status messages that are posted to an activity stream.
- *PrivateMessageManager* on page 1005. Manages messages between users.
- *RatingManager* on page 1017. 8.60 and higher Manages user ratings of content.
- *TagManager* on page 1042. Manages tags.

CommunityGroupManager

8.50 and higher

The CommunityGroupManager class manages groups of users.

Namespace

```
Ektron.Cms.Framework.Community.CommunityGroupManager
```

Constructors

- `CommunityGroupManager()`
- `CommunityGroupManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `CommunityGroupManagerService`. Returns an instance of the business objects task manager service.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetCalendarId* on page 831
- *GetDiscussionBoardId* on page 833
- *GetFolderId* on page 834
- *GetItem* on page 836
- *GetList (CommunityGroupCriteria)* on page 838 (CommunityGroupCriteria)
- *GetList (UserToCommunityGroupCriteria)* on page 841 (UserToCommunityGroupCriteria)
- *GetMemberStatus* on page 843
- *GetTaxonomyId* on page 845
- *GetUserList* on page 847
- *Invite* on page 849 (email)
- *Invite* on page 850 (user)
- *IsUserInGroup* on page 852
- *RemoveUser* on page 853
- *RequestJoin* on page 855
- *Update* on page 856

AcceptInvite

```
AcceptInvite(System.Int64,System.Int64)
```

Accepts an invitation of a community group.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Community Group ID
- * User ID

Parameters

- `communityGroupId`. ID of the community group.
- `userId`. ID of the user.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxCommunityGroupIdLabel"

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Add

```
Add(Ektron.Cms.CommunityGroupData)
```

Adds a community group.

When you add the community group data, the method returns a custom CMSData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Group Name
- Enable Distribute
- Enable Group Mail
- Group Image
- * Group Admin Id
- Short Description
- Long Description

Parameters

- `communityGroupData`. The CommunityGroupData object to add.

Returns

Returns the custom CommunityGroupData object added.

        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a community group from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `ID`. ID of the community group to delete.

Remarks

Validate the item using `GetItem()` before deleting.

```

GetList (CommunityGroupCriteria)

```
GetList(Ektron.Cms.Community.CommunityGroupCriteria)
```

Retrieves community groups associated with the specified users. Username or UserId are required criteria for this method to return data.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Community Group Property
- * Object Value

Parameters

- `criteria`. Used to specify, or filter, the community groups to return.

Returns

A list of community groups.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Invite

```
Invite(System.Int64,System.Int64)
```

Invites a user to a community group.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Community Group ID
- * User ID

Parameters

- `communityGroupId`. ID of the community group.
- `userId`. ID of the user.

.aspx code snippet

```
<ol class="formFields">

        }
    }
```

Update

```
Update(Ektron.Cms.CommunityGroupData)
```

Updates an existing community group item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Group ID
- Group Name
- Enable Distribute
- Enable Group Mail
- Short Description
- Long Description

Parameters

- `communityGroupData`. The CommunityGroupData object to update.

Returns

Returns the custom CommunityGroupData object that was updated.

Remarks

Validate the community group item with `GetItem()` before you update the properties. Then, call `Update` with your modified CommunityGroupData object.

NOTE: You cannot change all properties after the initial Add event, such as the CommunityGroupData.Type.

Data Classes

CommunityGroupCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `CommunityGroupCriteria()`

  ```
  public CommunityGroupCriteria()
  ```

- `CommunityGroupCriteria(Ektron.Cms.CommunityGroupProperty, EkEnumeration.OrderByDirection)`

  ```
  public CommunityGroupCriteria(Ektron.Cms.CommunityGroupProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CommunityGroupProperty` are:

  - AdminId
  - CreatedUser
  - DateCreated
  - DateModified
  - EnableCalendar
  - EnableDiscussionBoard
  - EnableDistribute
  - EnableDocumentsInNotifications
  - EnableGroupEmail
  - EnableMembersManageFolders
  - EnableTodoList
  - Enroll
  - FolderId
  - GroupEnroll
  - GroupId
  - GroupImage
  - GroupLevel
  - GroupLocation
  - GroupName

- GroupParentId
- GroupPath
- Id
- Image
- Level
- Location
- LongDescription
- Name
- ParentId
- Path
- ShortDescription

Properties

- `ReturnAdminList`

```
public bool ReturnAdminList { set; get; }
```

CommunityGroupData

Namespace

```
Ektron.Cms
```

Properties

- `Admin`

```
public Ektron.Cms.UserBaseData Admin { set; get; }
```

- `Admins`

```
public System.Collections.Generic.List<UserData> Admins { set; get; }
```

- `AllowMemberstoManageFolders`

```
public bool AllowMembersToManageFolders { set; get; }
```

- `Category`

```
public string Category { set; get; }
```

- `CreatedDate`

```
public System.DateTime CreatedDate { set; get; }
```

- `CreatedUser`

```
public long CreatedUser { set; get; }
```

- `EmailAccountName`. Email Account name assigned to community group. This is required for checking group email.

```
public string EmailAccountName { set; get; }
```

- `EmailAddress`. Email address assigned to Community Group.

```
public string EmailAddress { set; get; }
```

- `EmailPassword`. Password for email account assigned to community group. This is required for checking group email.

```
public string EmailPassword { set; get; }
```

- `EnableCalendar`

```
public bool EnableCalendar { set; get; }
```

- `EnableDiscussionBoard`

```
public bool EnableDiscussionBoard { set; get; }
```

- `EnableDistributeToSite`

```
public bool EnableDistributeToSite { set; get; }
```

- `EnableDocumentsInNotifications`. If true, all notification emails on asset types will have the asset added as an attachment.

```
public bool EnableDocumentsInNotifications { set; get; }
```

- `EnableGroupEmail`. If true, the community group will accept email using the email address.

```
public bool EnableGroupEmail { set; get; }
```

- `EnableTodoList`

```
public bool EnableTodoList { set; get; }
```

- `Enroll`

```
public bool Enroll { set; get; }
```

- `FolderId`

```
public long FolderId { set; get; }
```

- `GroupAdmin`

```
public Ektron.Cms.UserBaseData GroupAdmin { set; get; }
```

- `GroupCategory`

```
public string GroupCategory { set; get; }
```

- `GroupCreatedDate`

```
public System.DateTime GroupCreatedDate { set; get; }
```

- `GroupEnableDistributeToSite`

```
public bool GroupEnableDistributeToSite { set; get; }
```

- `GroupEnroll`

```
public bool GroupEnroll { set; get; }
```

- `GroupHidden`

```
public bool GroupHidden { set; get; }
```

- `GroupId`. This property is obsolete in 8.5. Use Id.

```
public long GroupId { set; get; }
```

- `GroupImage`

```
public string GroupImage { set; get; }
```

- `GroupLevel`

```
public int GroupLevel { set; get; }
```

- `GroupLocation`

```
public string GroupLocation { set; get; }
```

- GroupLongDescription

```
public string GroupLongDescription { set; get; }
```

- GroupName

```
public string GroupName { set; get; }
```

- GroupParentId

```
public long GroupParentId { set; get; }
```

- GroupPath

```
public string GroupPath { set; get; }
```

- GroupShortDescription

```
public string GroupShortDescription { set; get; }
```

- HasSubGroup

```
public bool HasSubGroup { set; get; }
```

- Hidden

```
public bool Hidden { set; get; }
```

- Id

```
public override long Id { set; get; }
```

- Image

```
public string Image { set; get; }
```

- Level

```
public int Level { set; get; }
```

- Location

```
public string Location { set; get; }
```

- LongDescription

```
public string LongDescription { set; get; }
```

- Name

```
public string Name { set; get; }
```

- ParentId

```
public long ParentId { set; get; }
```

- Path

```
public string Path { set; get; }
```

- ShortDescription

```
public string ShortDescription { set; get; }
```

- Tags. This property is read-only and any changes will not be saved. To add tags to a CommunityGroup, use the AddTagToCommunityGroup API.

```
public string Tags { set; get; }
```

- TotalMember. Gets the total number of member sin the community group. This property is read-only and will not be persisted on Add or Update.

```
public int TotalMember { set; get; }
```

- `ToXmlString()`

```
public string ToXmlString()
```

FavoriteManager

8.50 and higher

The FavoriteManager class manages a list of Ektron CMS content and external Web links (URLs) that a user has designated as favorite content.

Namespace

```
Ektron.Cms.Framework.Community.FavoriteManager
```

Constructors

- `FavoriteManager()`
- `FavoriteManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FavoriteManagerService`. Returns an instance of the business objects favorite manager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Community.FavoriteItemData)
```

Adds a favorite item, with details from the supplied FavoriteItemData object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Object Type
- * Object Value
- * User ID
- Description

Parameters

- `favoriteItemData`. The FavoriteItemData object to add.

Returns

A custom FavoriteItemData object.

```

Delete

```
Delete(System.Int64)
```

Deletes a favorite item from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Object Type

Parameters

- `id`. ID of the favorite item to delete.
- `type`. Favorite type.

Remarks

Validate the item using `GetItem()` before deleting.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(FavoriteItemCriteria)
```

Retrieves lists of objects through the GetList(FavoriteItemCriteria) method.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Favorite Item Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve objects

Returns

A list of FavoriteItemData.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.FavoriteItemData)
```

Update an existing favorite item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Title
- * Object Type
- * Object Value
- Description

Parameters

- `favoriteItemData`. The FavoriteItemData object to update.

Returns

Returns the custom FavoriteItemData object that was updated.

Remarks

Validate the Favorite item with `GetItem()` before you update the properties. Then, call `Update` with your modified FavoriteItemData object.

NOTE: You cannot change all properties after the initial Add event, such as the FavoriteItemData.Type.

Data Classes

FavoriteItemCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `FavoriteItemCriteria()`

  ```
  public FavoriteItemCriteria()
  ```

- `FavoriteItemCriteria(Ektron.Cms.Common.FavoriteItemProperty, EkEnumeration.OrderByDirection)`

  ```
  public FavoriteItemCriteria(Ektron.Cms.Common.FavoriteItemProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `FavoriteItemProperty` are:

- Description
- FavoriteTaxonomyId
- FavoriteType
- Id
- ObjectId
- Title
- Url
- UserId

FavoriteItemData

Namespace

```
Ektron.Cms.Community
```

Properties

- `Description`. Gets or sets the description of the favorite.

  ```
  public string Description { set; get; }
  ```

- `Id`. Gets or sets the ID of the CMS Data object. This property is inherited from the CMSData base class and is not applicable to FavoriteItemData. FavoriteItemData does not have a unique ID.

  ```
  public override long Id { set; get; }
  ```

- `ObjectId`. Gets or sets the Id of the favorite object. This would be the content ID if the favorite type is Content.

  ```
  public long ObjectId { set; get; }
  ```

- `ObjectType`. Gets or sets the Favorite type.

  ```
  public Ektron.Cms.Common.FavoriteType ObjectType { set; get; }
  ```

- `TaxonomyId`. Gets or sets the ID of the Taxonomy Node this favorite Item saved in.

  ```
  public long TaxonomyId { set; get; }
  ```

- `Title`. Gets or sets the Title of the favorite. If its a content favorite, this is the content title and cannot be changed. If its a URL favorite, then it can be set.

  ```
  public string Title { set; get; }
  ```

- `Url`. Gets or sets the URL of the favorite.

  ```
  public string Url { set; get; }
  ```

- `UserId`. Gets or setsa the User ID whom this favorite Item belongs to.

  ```
  public long UserId { set; get; }
  ```

FavoriteTaxonomyManager

8.50 and higher

The FavoriteTaxonomyManager class manages user favorite taxonomies.

Ektron's taxonomy is a content-level categorization system that uses one-to-many relationships to create a scalable organization of content. Content is categorized in the database by how it relates to multiple categories, allowing it to be accessed in multiple ways for multiple purposes. The hierarchy of the content is arranged from the general to the specific, and there may be multiple "routes" that define the content at the end of the hierarchy.

Namespace

```
Ektron.Cms.Framework.Community.FavoriteTaxonomyManager
```

Constructors

- `FavoriteTaxonomyManager()`
- `FavoriteTaxonomyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FavoriteFolderManagerService`. Returns an instance of the business objects task manager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the facing page
- *Delete* on page 885
- *GetItem* on page 886
- *GetTree* on page 888

- *GetUserTaxonomy* on page 890
- *Update* on page 892

Add

```
Add(Ektron.Cms.Community.FavoriteTaxonomyData)
```

Adds a favorite taxonomy.

When you add the FavoriteTaxonomyData object, the method returns a favorite taxonomy ID object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Parent ID (Taxonomy ID)
- Description

Parameters

- `favoriteTaxonomyData`. The FavoriteTaxonomyData object to add

.aspx code snippet

```
<ol class="formFields">

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a favorite taxonomy from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The favorite taxonomy ID to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">

        }
    }
```

GetTree

```
GetTree(System.Int64,System.Int32,System.Boolean,Ektron.Cms.PagingInfo)
```

Retrieves the taxonomy tree for a favorite.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Depth
- * Include Items
- * Records Per Page

Parameters

- `id`. The FavoriteTaxonomyData ID to be retrieved. Internally the folder is stored as Taxonomy so this is the corresponding taxonomy ID.
- `depth`. The FavoriteTaxonomyData structure depth to retrieve.

- `includeItems`. Set whether the returned object contains included items.
- `pagingInfo`. Set paging details.

        }
    }
```

Update

```
Update(Ektron.Cms.FavoriteTaxonomyData)
```

Updates an existing favorite taxonomy item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Favorite Taxonomy ID
- Title
- Description

Parameters

- `favoriteTaxonomyData`. The FavoriteTaxonomyData object to update.

Remarks

Validate the favorite taxonomy item with `GetItem()` before you update the properties. Then, call `Update` with your modified FavoriteTaxonomyData object.

NOTE: You cannot change all properties after the initial Add event, such as the FavoriteTaxonomyData.Type.

.aspx code snippet

```

    }
```

Data Classes

FavoriteTaxonomyData

Namespace

```
Ektron.Cms.Community
```

Properties

- `ChildTaxonomies`. Gets or sets the favorite child taxonomy in the current taxonomy. If not retrieved, this will be an empty list.

  ```
  public System.Collections.Generic.List<FavoriteTaxonomyData>
    ChildTaxonomies { set; get; }
  ```

- `Description`. Gets or sets the description of the favorites's taxonomy.

```
public string Description { set; get; }
```

- `FavoriteTaxonomyData()`

```
public FavoriteTaxonomyData()
```

- `Id`. Gets or sets the ID of the favorite taxonomy. Overridden to clarify the description and taxonomy relationship

```
public override long Id { set; get; }
```

- `Items`. Gets or sets the Favorites in the taxonomy. If not retrieved, this will be an empty list.

```
public System.Collections.Generic.List<FriendsData> Items { set; get; }
```

- `Name`. Gets or sets the Favorites taxonomy name.

```
public string Name { set; get; }
```

- `ParentId`. Gets or sets the ID of the Favorites folder's parent taxonomy.

```
public long ParentId { set; get; }
```

FlagManager

8.50 and higher

The FlagManager class manages flags that are assigned to content to provide feedback. For information about flagging, see Flagging in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Community.FlagManager
```

Constructors

- `FlagManager()`
- `FlagManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FlagManagerService`. Returns an instance of the business objects FlagManager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.ObjectFlagData)
```

Adds a flag to community content whose ID is specified in the objectFlagData.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Type
- * Object ID
- * Flag Option
- Flag Comment

Parameters

- `objectFlagData`. The ObjectFlagData object.

Remarks

Before using this add method, define a flag. Do this by logging into the CMS and navigating to **Workarea > Settings > Community Management > Flagging > Community Flagging Definition**.

```

Delete

```
Delete(System.Int64)
```

Deletes a flag from community content whose ID is specified in the objectFlagData.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Flag ID

Parameters

- `objectFlagId`. The ID of the ObjectFlagData type to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

```

Update

```
Update(Ektron.Cms.ObjectFlagData)
```

Updates an existing ObjectFlag item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Flag Option
- Flag Comment

Parameters

- `objectFlagData`. The flag object.

Returns

Returns the custom ObjectFlagData object updated.

Remarks

Validate the flag item with `GetItem()` before you update the properties. Then, call `Update` with your modified ObjectFlagData object.

NOTE: You cannot change all properties after the initial Add event, such as the ObjectFlagData.Type.

```

Data Classes

FlagCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `FlagCriteria()`

  ```
  public FlagCriteria()
  ```

- `FlagCriteria(Ektron.Cms.Common.FlagProperty, EkEnumeration.OrderByDirection)`

  ```
  public FlagCriteria(Ektron.Cms.Common.FlagProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `FlagProperty` are:

  - Comment
  - Date
  - FlagDefinitionId
  - FlagOptionId
  - Id
  - ObjectId
  - ObjectLanguageId
  - ObjectType
  - UserId
  - VisitorId

ObjectFlagData

Namespace

```
Ektron.Cms
```

Properties

- `Comment`. Gets or sets the comment associated with this flag instance.

  ```
  public string Comment { set; get; }
  ```

- `Date`. Gets or sets the Date the object was flagged.

  ```
  public System.DateTime Date { set; get; }
  ```

- FlagComment

```
public string FlagComment { set; get; }
```

- FlagDate

```
public System.DateTime FlagDate { set; get; }
```

- FlagDefinitionId. Gets the ID of the Flag Definition used by this flag instance. When saving this value is not neccessary and will be derived from FlagOptionId.

```
public long FlagDefinitionId { set; get; }
```

- FlagEntryId

```
public long FlagEntryId { set; get; }
```

- FlagId

```
public long FlagId { set; get; }
```

- FlagItemId

```
public long FlagItemId { set; get; }
```

- FlagOptionId. Gets or sets the ID of the Flag Definition Option that is being chosen for this Flag instance.

```
public long FlagOptionId { set; get; }
```

- Id. Gets the unique ID of this Object Flag Instance once saved.

```
public override long Id { set; get; }
```

- ObjectId. Gets or sets the ID of the object that is being flagged. This property correlates directly with ObjectType. For Example, if ObjectType == Content, then ObjectId would be the Content ID being flagged.

```
public long ObjectId { set; get; }
```

- ObjectLanguageId. Gets or sets the Id of the Language of the object being flagged.

```
public int ObjectLanguageId { set; get; }
```

- ObjectType. Gets or sets the Type of Object being flagged.

```
public EkEnumeration.CMSObjectTypes ObjectType { set; get; }
```

- ToXmlString()

```
public string ToXmlString()
```

- UserId. Gets or sets the Id of the logged in user who is creting this flag instance. If the user is not logged in, use visitorId.

```
public long UserId { set; get; }
```

- VisitorId. Gets or sets the ID of the non-logged in user that performed this flag. This property is only used for users that are not logged in. The CMS trackes these users by a unique visitor ID stored in a cookie and may overwrite value of this property. Logged in users should populate the UserId property.

```
public string VisitorID { set; get; }
```

FriendsManager

8.50 and higher

The FriendsManager class manages colleague connections (friends).

Namespace

```
Ektron.Cms.Framework.Community.FriendsManager
```

Constructors

- `FriendsManager()`
- `FriendsManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FriendsManagerService`. Returns an instance of the business objects friends manager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetPendingList* on page 928
- *Invite (email)* on page 930 (email)
- *Invite (user)* on page 931 (user)
- *IsFriend* on page 933
- *Update* on page 934

AcceptInvite

```
AcceptInvite(Ektron.Cms.Community.PendingFriendsData)
```

Accepts a friend's invitation.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Pending Friend ID

Parameters

- `pendingFriendData`. *PendingFriendsData* on page 938 details.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxFriendIdLabel" AssociatedControlID="uxFriendId"
CssClass="span-4 last" runat="server" Text="* Pending Friend Id:" />
        <ektronUI:TextField ID="uxFriendId" CssClass="span-6" runat="server"
ValidationGroup="RegisterValidationGroup" />
    </li>

    <li class="clearfix">
        <ektronUI:Button id="uxSubmit" runat="server" OnClick="uxSubmit_Click"
Text="Accept Invite"></ektronUI:Button>
        <ektronUI:Label ID="uxRequiredLabel" CssClass="span-4" runat="server" Text="* -
Required" />
    </li>
</ol>

<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

.aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
```

```
using System.Web.UI.WebControls;
using Ektron.Cms.Community;
using Ektron.Cms.Framework.Community;
```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            friendId = long.Parse(uxFriendId.Text);

            FriendsManager friendsManager = new FriendsManager();
            List<PendingFriendsData> pendingFriendsData = friendsManager.GetPendingList
(friendsManager.RequestInformation.UserId);

            PendingFriendsData selectedFriend = pendingFriendsData.FirstOrDefault(x =>
x.UserId == friendId);
            if (selectedFriend != null)
            {
                friendsManager.AcceptInvite(selectedFriend);
                MessageUtilities.UpdateMessage(uxMessage,"Invite accepted. ",
Message.DisplayModes.Success);
            }
            else
            {
                MessageUtilities.UpdateMessage(uxMessage, "Invite not found. ",
Message.DisplayModes.Error);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Add

```
Add(Ektron.Cms.FriendsData)
```

Adds a friends data object. When you add the FriendsData, the method returns a Friends object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Friend User ID

Parameters

- `friendsData`. The FriendsData object to add.

Returns

Returns the custom FriendsData object added.

    }
```

GetList

```
GetList(FriendsCriteria)
```

Retrieves lists of objects through the GetList(FriendsCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Friends Data Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve friends.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.FriendsData)
```

Updates an existing Friends item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Friend ID
- * Folder ID

Parameters

- `friendsData`. The FriendsData object to update.

Returns

Returns the custom FriendsData object that was updated.

Remarks

Validate the Friends ID and Folder ID with `GetItem()` before you update the properties. Then, call `Update` with your modified FriendsData object.

NOTE: You cannot change all properties after the initial Add event, such as the FriendsData.Type.

public FriendsCriteria()
```

- `FriendsCriteria(Ektron.Cms.Common.FriendsProperty, EkEnumeration.OrderByDirection)`

```
public FriendsCriteria(Ektron.Cms.Common.FriendsProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `FriendsProperty` are:

- FriendsUserId
- TaxonomyId
- TaxonomyName
- TaxonomyPath
- UserId

FriendsData

Namespace

```
Ektron.Cms.Community
```

Properties

- `Avatar`

```
public string Avatar { set; get; }
```

- `DisplayName`

```
public string DisplayName { set; get; }
```

- `Email`

```
public string Email { set; get; }
```

- `FirstName`

```
public string FirstName { set; get; }
```

- `FriendsUserId`. Gets or sets the UserId of the friend being added.

```
public long FriendUserId { set; get; }
```

- `LastName`

```
public string LastName { set; get; }
```

- `TaxonomyId`. ID of the Taxonomy to put the friend in for User ID. If not set, it will go in the users root Friends taxonomy folder.

```
public long TaxonomyId { set; get; }
```

- `UserId`. Gets or sets the ID of the user who is adding the friend.

```
public long UserId { set; get; }
```

- `Username`

```
public string Username { set; get; }
```

InvitationSendRequestData

Namespace

```
Ektron.Cms.Common
```

Properties

- `EmailAddress`

```
public System.Collections.ObjectModel.Collection<string>
   EmailAddresses { get; }
```

- `InvitationSendRequestData()`

```
public InvitationSendRequestData()
```

- `NonuserMessageId`

```
public long NonuserMessageId { set; get; }
```

- `OptionalText`

```
public string OptionalText { set; get; }
```

- `SenderId`

```
public long SenderId { set; get; }
```

- `UserIds`. Gets or sets the ID of the user who is adding the friend.

```
public System.Collections.ObjectModel.Collection<long>
  UserIds { get; }
```

- `UserMessageId`. Gets or sets the UserId of the friend being added.

```
public long UserMessageId { set; get; }
```

PendingFriendsData

Namespace

```
Ektron.Cms.Community
```

Properties

- `InvitationId`

```
public long InvitationId { set; get; }
```

FriendsTaxonomyManager

8.50 and higher

The FriendsTaxonomyManager class manages taxonomies of colleague connections (friends).

Namespace

```
Ektron.Cms.Framework.Community.FriendsTaxonomyManager
```

Constructors

- `FriendsTaxonomyManager()`
- `FriendsTaxonomyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FriendsFolderManagerService`. Returns an instance of the business objects task manager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.FriendTaxonomyData)
```

Adds a friends taxonomy data object.

When you add the friends taxonomy data, the method returns a friends object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Parent ID (Taxonomy ID)
- Description

Parameters

- `friendFolderData`. The FriendTaxonomyData object to add.

Returns

Returns the custom FriendTaxonomyData object added.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a friends taxonomy from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `Id`. The identifier of the FriendTaxonomyData item to delete.

Remarks

Validate the item using `GetItem()` before deleting.

    }
```

GetItem

```
GetItem(System.Int64)
```

Retrieves the properties of a specific FriendTaxonomyData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `Id`. The ID of the FriendTaxonomyData item to get. Internally the folder is stored as Taxonomy so this is the corresponding taxonomy ID.

Returns

FriendTaxonomyData details in a FriendTaxonomyData object.

.aspx code snippet

```

```

Update

```
Update(Ektron.Cms.FriendTaxonomyData)
```

Updates an existing friends taxonomy item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Friend Taxonomy ID
- * Title
- Description

Parameters

- `friendTaxonomyData`. The FriendTaxonomyData object to update.

Returns

Returns the custom FriendTaxonomyData object updated.

Remarks

Validate the FriendsTaxonomy item with `GetItem()` before you update the properties. Then, call `Update` with your modified FriendsTaxonomyData object.

NOTE: You cannot change all properties after the initial Add event, such as the FriendsTaxonomyData.Type.

```

Data Classes

FriendTaxonomyData

Namespace

```
Ektron.Cms.Community
```

Properties

- `ChildTaxonomies`. Gets or sets the Friends child taxonomy in the current taxonomy. If not retrieved, this will be an empty list.

  ```
  public System.Collections.Generic.List<FriendTaxonomyData>
    ChildTaxonomies { set; get; }
  ```

- `Description`. Gets or sets the description of the taxonomy's folder.

  ```
  public string Description { set; get; }
  ```

- `FriendTaxonomyData()`

  ```
  public FriendTaxonomyData()
  ```

- `Id`. Gets or sets the ID of the Friends taxonomy. Overridden to clarify the description and taxonomy relationship

  ```
  public override long Id { set; get; }
  ```

- `Items`. Gets or sets the Friends in the taxonomy. If not retrieved, this will be an empty list.

  ```
  public System.Collections.Generic.List<FriendsData> Items { set; get; }
  ```

- `Name`. Gets or sets the Friends taxonomy name.

  ```
  public string Name { set; get; }
  ```

- `ParentId`. Gets or sets the ID of the Friends folder's parent taxonomy.

  ```
  public long ParentId { set; get; }
  ```

MessageBoardManager

8.50 and higher

The MessageBoardManager class manages items that are posted on a message board.

Namespace

```
Ektron.Cms.Framework.Community.MessageBoardManager
```

Constructors

- `MessageBoardManager()`
- `MessageBoardManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MessageBoardManagerService`. Returns an instance of the business objects messageboard manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- `IsUserMessageBoardAdmin(Int64,MessageBoardObjectType,Int64)`. 8.60 and higher Checks whether a user is a MessageBoard admin.
- *Update* on page 973

Add

```
Add(Ektron.Cms.MessageBoardData)
```

Adds a message board post with details from the supplied MessageBoardData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Type
- * Object Value
- Message Text

Parameters

- `messageBoardData`. Message board post data to add.

Returns

Returns the custom MessageBoardData object added.

```

GetList

```
GetList(MessageBoardCriteria)
```

Retrieves lists of objects through the GetList(MessageBoardCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Community Group Property
- * Object Value

Parameters

- `criteria`. Used to specify, or filter, the message board to return.

Returns

A list of message boards.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.FriendTaxonomyData)
```

Updates an existing message board item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Message ID
- * Message Text

Parameters

- `messageBoardData`. Message board post data to update.

Returns

Returns the custom MessageBoardData object updated.

Remarks

Validate the message board item with `GetItem()` before you update the properties. Then, call `Update` with your modified MessageBoardData object.

NOTE: You cannot change all properties after the initial Add event, such as the MessageBoardData.Type.

        }
    }
```

Data Classes

MessageBoardCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `MessageBoardCriteria()`

```
public MessageBoardCriteria()
```

- `MessageBoardCriteria(Ektron.Cms.Common.MessageBoardProperty, EkEnumeration.OrderByDirection)`

```
public MessageBoardCriteria(Ektron.Cms.Common.MessageBoardProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `MessageBoardProperty` are:

- DateCreated
- DateModified
- DisplayName
- HasPendingReplies
- HasReplies
- IsModerated
- LanguageId
- MessageId
- ObjectId
- ObjectType
- ReplayCount
- Status
- UserId
- UserName

MessageBoardData

Namespace

```
Ektron.Cms
```

Properties

- `AllowApproval`

```
public bool AllowApproval { set; get; }
```

- `AllowDelete`

```
public bool AllowDelete { set; get; }
```

- `AllowModeration`

```
public bool AllowModeration { set; get; }
```

- `DateCreated`

```
public System.DateTime DateCreated { set; get; }
```

- `DateModified`

```
public System.DateTime DateModified { set; get; }
```

- DisplayName

```
public string DisplayName { set; get; }
```

- DisplayUserName

```
public string DisplayUserName { set; get; }
```

- HasPendingReplies

```
public bool HasPendingReplies { get; }
```

- HasReplies

```
public bool HasReplies { get; }
```

- Id

```
public override long Id { set; get; }
```

- IsModerated. Gets or sets the IsModerated flag. This flag is used on ADD to determine if the message board post should follow moderation. On retrieval, it will not be set because the message board post itself has no concept of moderation.

```
public bool IsModerated { set; get; }
```

- LanguageId

```
public int LanguageId { set; get; }
```

- MessageId

```
public long MessageId { set; get; }
```

- MessageText

```
public string MessageText { set; get; }
```

- ObjectId

```
public long ObjectId { set; get; }
```

- ObjectType

```
public EkEnumeration.MessageBoardObjectType ObjectType { set; get; }
```

- PendingReplies

```
public int PendingReplies { set; get; }
```

- ReplyCount

```
public int ReplyCount { set; get; }
```

- SiteId

```
public long SiteId { set; get; }
```

- Status

```
public string Status { set; get; }
```

- UserAvatar

```
public string UserAvatar { set; get; }
```

- UserEmailAddress

```
public string UserEmailAddress { set; get; }
```

- UserFirstname

```
public string UserFirstName { set; get; }
```

- UserId

```
public long UserId { set; get; }
```

- UserLastName

```
public string UserLastname { set; get; }
```

- UserName

```
public string UserName { set; get; }
```

- UserRole

```
public string UserRole { set; get; }
```

MessageBoardObjectType

Namespace

```
Ektron.Cms.Common.EkEnumeration
```

Properties

- CommunityGroup

```
public Const CommunityGroup As
  Ektron.Cms.Common.EkEnumeration.MessageBoardObjectType = 2
```

- Content

```
public Const Content As
  Ektron.Cms.Common.EkEnumeration.MessageBoardObjectType = 0
```

- MessageReply

```
public Const MessageReply As
  Ektron.Cms.Common.EkEnumeration.MessageBoardObjectType = 3
```

- User

```
public Const User As
  Ektron.Cms.Common.EkEnumeration.MessageBoardObjectType = 1
```

MicromessageManager

8.50 and higher

The MicromessageManager class manages user status messages that are posted to an activity stream.

Namespace

```
Ektron.Cms.Framework.Community.MicromessageManager
```

Constructors

- `MicromessageManager()`
- `MicromessageManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MicromessageManagerService`. Returns an instance of the business objects micromessage manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetUserMessageList* on page 997
- *IsFullTextSearchInstalled* on page 1000
- *IsSpam* on page 1001

Add

```
Add(Ektron.Cms.MicroMessageData)
```

Adds a micro-message with details from the supplied MicroMessageData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Message Text

Parameters

- `data`. The micro-message data.

Returns

Returns the custom MicroMessageData object added.

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

AddReply

```
AddReply(System.Int64,System.String)
```

Adds a new reply.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Message ID
- * Reply Text

Parameters

- `parentMessageId`. ID of the micro-message to which to add a reply.
- `messageText`. The text of the reply.

.aspx code snippet

```

```
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a micro-message from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `Id`. ID of the micro-message to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

.aspx code snippet

```
<ol class="formFields">

        }
    }
```

GetList

```
GetList(MicromessageCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Micro-message Property
- * Object Value

Parameters

- `criteria`. MicroMessageCriteria used to filter results.

See *Criteria use for GetList methods* on page 156 for additional information.

Remarks

Use ListView because it has a paging option and data grouping.

Use the default page size = 50.

GetPublicMessageList

```
GetPublicMessageList(Ektron.Cms.PagingInfo)
```

Retrieves a list of public and colleague messages that the requesting user has permission to see.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Records per page

Parameters

- `paging`. The paging object. Setting `RecordsPerPage = 0` retrieves all rows.

Returns

Returns a list of for the user messages.

Data Classes

MicroMessageCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Constructors

- `MicroMessageCriteria()`

  ```
  public MicroMessageCriteria()
  ```

- `MicroMessageCriteria(Ektron.Cms.MicroMessageProperty, EkEnumeration.OrderByDirection)`

  ```
  public MicroMessageCriteria(Ektron.Cms.MicroMessageProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `MicroMessageProperty` are:

  - Avatar
  - DateCreated
  - DateModified
  - DisplayName
  - EmailAddress
  - FirstName
  - LastName
  - MessaseId
  - ParentMessageId
  - ReplyCount
  - SiteId
  - UserId
  - UserName

MicroMessageData

Namespace

```
Ektron.Cms
```

Properties

- `AllowDelete`. Gets or sets the AllowDelete for this micromessage.

  ```
  public bool AllowDelete { set; get; }
  ```

- `DateCreated`. Gets or sets the DateCreated for this micromessage.

```
public System.DateTime DateCreated { set; get; }
```

- `DateModified`. Gets or sets the DateModified for this micromessage.

```
public System.DateTime DateModified { set; get; }
```

- `DisplayName`. Gets or sets the DisplayName for this micromessage.

```
public string DisplayName { set; get; }
```

- `DisplayUserName`. Gets or sets the DisplayUserName for this micromessage.

```
public string DisplayUserName { set; get; }
```

- `HasReplies`. Gets if this micromessage has replies.

```
public bool HasReplies { get; }
```

- `Id`. Gets or sets the Id for this micromessage.

```
public long Id { set; get; }
```

- `IsReply`. Gets if this micromessage is a reply.

```
private bool IsReply { get; }
```

- `MessageText`. Gets or sets the MessageText for this micromessage.

```
public string MessageText { set; get; }
```

- `ParentMessageId`. Gets or sets the ParentMessageId for this micromessage.

```
public long ParentMessageId { set; get; }
```

- `ReplyCount`. Gets or sets the ReplyCount for this micromessage.

```
public int ReplyCount { set; get; }
```

- `SiteId`. Gets or sets the SiteId for this micromessage.

```
public long SiteId { set; get; }
```

- `TimeLapse`. Gets or sets the TimeLapse for this micromessage.

```
public string TimeLapse { set; get; }
```

- `UserAvatar`. Gets or sets the UserAvatar for this micromessage.

```
public string UserAvatar { set; get; }
```

- `UserEmailAddress`. Gets or sets the UserEmailAddress for this micromessage.

```
public string UserEmailAddress { set; get; }
```

- `UserFirstName`. Gets or sets the UserFirstName for this micromessage.

```
public string UserFirstName { set; get; }
```

- `UserId`. Gets or sets the UserId for this micromessage.

```
public long UserId { set; get; }
```

- `UserLastname`. Gets or sets the UserLastName for this micromessage.

```
public string UserLastname { set; get; }
```

- `Username`. Gets or sets the UserName for this micromessage.

```
public string UserName { set; get; }
```

PrivateMessageManager

8.50 and higher

The PrivateMessageManager class manages messages between users.

Namespace

```
Ektron.Cms.Framework.Community.PrivateMessageManager
```

Constructors

- `PrivateMessageManager()`
- `PrivateMessageManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MessageManagerService`. Returns an instance of the business objects message manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Delete

```
Delete(System.Int64)
```

Deletes a private message from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the message to delete.

Remarks

Validate the item using `GetItem()` before deleting.

        }
    }
```

Send

```
Send(Ektron.Cms.PrivateMessageData)
```

Sends a private message based on the supplied PrivateMessageData object. You can add multiple recipients using PrivateMessageData.Recipients property.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * To (User ID)
- * Subject
- * Message

Parameters

- `messageData`. The PrivateMessageData object to send.

Returns

Returns the PrivateMessageData object added.

RatingManager

8.60 and higher

The RatingManager class manages user ratings of content.

Namespace

```
Ektron.Cms.Framework.Community.RatingManager
```

Constructors

- `RatingManager()`
- `RatingManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RatingService`. Returns an instance of the business objects Rating Service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.FriendTaxonomyData)
```

Adds a rating for the object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object ID
- * Object Type

- User Ratings (between 1 and 10 and no decimal values)
- User Comments

Parameters

- `ratingData`. The RatingData object to add.

Returns

Returns the custom RatingData object added.

```

Delete

```
Delete(System.Int64)
```

Deletes a rating.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Rating ID

Parameters

- `ratingId`. The identifier of the rating to delete.

Remarks

Validate the item using `GetItem()` before deleting.

GetUserTaxonomy

```
GetStatistics(System.Int64,Ektron.Cms.Common.EkEnumeration.CMSObjectTypes)
```

Retrieves a list of statistics by object type and ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object ID
- * Object Type

Parameters

- `objectType`. Type of the object has rated.
- `objectId`. Rated object ID.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.RatingData)
```

Updates a rating for an object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Rating ID
- * Object Type
- User Rating (between 1 and 10 and no decimal values)
- User Comments

Parameters

- `ratingData`. The rating object to update.

Returns

Returns the custom RatingData object updated.

Remarks

Validate the rating item with `GetItem()` before you update the properties. Then, call `Update` with your modified RatingData object.

NOTE: You cannot change all properties after the initial Add event, such as the RatingData.Type.

Data Classes

RatingCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `RatingCriteria()`

  ```
  public RatingCriteria()
  ```

- `RatingCriteria(Ektron.Cms.Common.RatingProperty, EkEnumeration.OrderByDirection)`

  ```
  public RatingCriteria(Ektron.Cms.Common.RatingProperty orderByField,
  EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `RatingProperty` are:

  - Id
  - LanguageId
  - ObjectId
  - ObjectType
  - RatingDate
  - RatingState
  - UserId
  - VisitorId

RatingData

Namespace

```
Ektron.Cms
```

Properties

- LanguageId

```
public int LanguageId { set; get; }
```

- ObjectId

```
public long ObjectId { set; get; }
```

- ObjectType

```
public Ektron.Cms.Common.EkEnumeration.CMSObjectTypes
   ObjectType { set; get; }
```

- RatingDate

```
public System.DateTime RatingDate { set; get; }
```

- RatingState

```
public Ektron.Cms.Common.EkEnumeration.RatingState
  RatingState { set; get; }
```

- UserComments

```
public string UserComments { set; get; }
```

- UserId

```
public long UserId { set; get; }
```

- UserRating

```
public int UserRating { set; get; }
```

- VisitorId

```
public string VisitorId { set; get; }
```

TagManager

8.50 and higher

The TagManager class manages tags. Tags are keywords that you can assign to content and library items, which allows for tag-based searching. For example, you can add the tag *Electronics* and tag content that is related to the electronic devices, so that people can search for the content using the *Electronics* tag. For information about how tagging is used in Ektron, see Tagging Content, Library Items, Users, and Groups with Keywords in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Community.TagManager
```

Constructors

- `TagManager()`
- `TagManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TagManagerService`. Returns an instance of the business objects TagManager service.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the facing page
- *Delete* on page 1044
- *GetItem* on page 1046
- *GetList* on page 1048

- *Tag* on page 1054
- *Update* on page 1055

Add

```
Add(Ektron.Cms.TagData)
```

Adds a tag based on information in a TagData object. The method populates the tag.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tag Type
- * Tag Text

Parameters

- `tagData`. The TagData object to add.

Returns

Returns the custom TagData object added.

```

GetTagCloud

```
GetTagCloud(TagCloudRequestData.Int32)
```

Retrieves a tag cloud.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Language ID (default: 1033)
- * Page Size (default: 50)
- * Tag Type (default: TagTypes.All)
- * Order By (default: TagOrderBy.Text)

- * Order By Direction (default: EkEnumeration.OrderByDirection.Ascending)
- * Object Type (default: EkEnumeration.CMSObjectTypes.User)

Parameters

- `request`. Contains the parameters for the tag cloud to retrieve.
- `totalRecords`. Returns the total number of tags available in the requested cloud.

Returns

A tag cloud object representing the request.

Tag

```
Tag(System.String,System.Int64,Ektron.Cms.Common.EkEnumeration.CMSObjectTypes)
```

Tags content with supplied details.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Tag
- * Object ID
- * Tag Type

Parameters

- `tag`. The string that contains the tag text.
- `objectId`. The object ID to be tagged.
- `objectType`. The object type to be tagged.

.aspx code snippet

```

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.TagData)
```

Updates an existing TagData item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Tag Type

Parameters

- `tagData`. The TagData object to update.

Returns

Returns the custom TagData object update

Remarks

Validate the TagData item with `GetItem()` before you update the properties. Then, call `Update` with your modified TagData object.

NOTE: You cannot change all properties after the initial Add event, such as the TagData.Type.

Data Classes

TagCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Community
```

Constructors

- `TagCriteria()`

  ```
  public TagCriteria()
  ```

- `TagCriteria(Ektron.Cms.Common.TagProperty, EkEnumeration.OrderByDirection)`

  ```
  public TagCriteria(Ektron.Cms.Common.TagProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TagProperty` are:

  - Id
  - LanguageId
  - Text
  - Type

TagData

Namespace

```
Ektron.Cms
```

Properties

- `Id`. ID of tag, which should be set only for existing tags. New tags will be given an ID when they are saved.

  ```
  public long Id { set; get; }
  ```

- `LanguageId`. Language of the tag.

  ```
  public int LanguageId { set; get; }
  ```

- `TagData()`. Constructor.

  ```
  public TagData()
  ```

- `TagData(string)`. Constructor.

  ```
  public TagData(string text)
  ```

- `TagData(string, int)`. Constructor.

  ```
  public TagData(string text, int languageId)
  ```

- `TagData(sting, int, long)`. Constructor.

  ```
  public TagData(string text, int languageId, long id)
  ```

- `Text`. The tag's actual text.

  ```
  public string Text { set; get; }
  ```

- `TotalUsedCount`. Returns the total number of times this tag has been used on an object.

  ```
  public int TotalUsedCount { set; get; }
  ```

- `Type`. The type of tag.

```
public Ektron.Cms.TagTypes Type { set; get; }
```

- `Validate()`

```
public override ValidationResults Validate()
```

Content

8.50 and higher

The Content manager category manages Web content and has the following classes:

- *AssetManager* on the facing page. Manages assets, which are files that are created outside of Ektron CMS.
- *ContentManager* on page 1076. Manages content (including html, text, documents, and digital media).
- *ContentRatingManager* on page 1124. Manages user valuations on content.
- *LibraryManager* on page 1142. Manages libraries, which stores images, files, quicklinks, and hyperlinks that can be inserted into editor content.
- *MetadataTypeManager* on page 1157. Manages metadata types, such as title and other artifacts.
- *TemplateManager* on page 1172. Manages templates, which typically includes page headers, footers, and placeholders for content, forms, summaries, calendars, collections, or other page elements.

AssetManager

8.50 and higher

The AssetManager class manages assets, which are files that are created outside of Ektron CMS.

Namespace

```
Ektron.Cms.Framework.Content.AssetManager
```

Constructors

- `AssetManager()`
- `AssetManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `AssetService`. Returns an instance of the business objects Asset Service.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.ContentAssetData)
```

Adds an asset.

NOTE: This method is not supported in WCF mode.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- * Title
- * File Path
- Keywords
- Summary

Parameters

- `assetData`. The ContentAssetData object.

Returns

Returns the custom ContentAssetData object.

.aspx code snippet

```
<ol class="formFields">

Delete

```
Delete(System.Int64)
```

Deletes an asset from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `contentId`. The ID of the asset to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

```

GetList

```
GetList(Ektron.Cms.Content.AssetCriteria)
```

Retrieves lists of AssetCriteria objects.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Asset Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve content.

Returns

List of asset objects matching the supplied criteria.

See *Criteria use for GetList methods* on page 156 for additional information.

Update

```
Update(Ektron.Cms.ContentAssetData)
```

Updates an existing ContentAssetData item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Folder ID
- * Content ID
- Title
- File Path
- Keywords
- Summary

Parameters

- `assetData`. The asset data object.

Returns

Returns the custom ContentAssetData object updated.

Remarks

Validate the asset item with `GetItem()` before you update the properties. Then, call `Update` with your modified ContentAssetData object.

NOTE: You cannot change all properties after the initial Add event, such as the ContentAssetData.Type.

```

Data Classes

AssetCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `AssetCriteria()`

  ```
  public ContentAssetCriteria()
  ```

- `AssetCriteria(Ektron.Cms.Content.AssetProperty, EkEnumeration.OrderByDirection)`

  ```
  public ContentAssetCriteria(Ektron.Cms.Content.AssetProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `AssetProperty` are:

  - AssetId
  - DateCreated
  - DateModified
  - FolderId
  - FolderName
  - Id
  - IsArchived
  - IsPublished
  - LanguageId
  - LastEditorFirstName
  - LastEditorLastName
  - Status
  - SubType
  - Title
  - Type
  - UserId
  - XmlConfigurationId

ContentAssetData

Namespace

```
Ektron.Cms.Content
```

Properties

- `AssetId`. Gets or sets the Asset ID of the content item for the AssetInfoData object and returns an Asset ID of the content item.

```
public string AssetId { set; get; }
```

- `File`. Gets or Sets an array of data that represents the asset's contents.

```
public byte[] File { set; get; }
```

- `FlagDefId`. Not applicable to this class..

```
public new long FlagDefId { set; get; }
```

- `Html`. Not applicable to this class.

```
public new string Html { set; get; }
```

- `Hyperlink`. Not applicable to this class.

```
public new string HyperLink { set; get; }
```

- `IsXmlInherited`. Not applicable to this class.

```
public new bool IsXmlInherited { set; get; }
```

- `LegacyData`. Not applicable to this class.

```
public new object LegacyData { set; get; }
```

- `MediaText`. Not applicable to this class.

```
public new string MediaText { set; get; }
```

- `StyleSheet`. Not applicable to this class.

```
public new string StyleSheet { set; get; }
```

- `TemplateConfiguration`. Not applicable to this class.

```
public new string TemplateConfiguration { set; get; }
```

- `Validate()`. Validates this instance and returns a ValidationResults object.

```
public override ValidationResults Validate()
```

- `XmlConfiguration`. Not applicable to this class.

```
public new XmlConfigData XmlConfiguration { set; get; }
```

- `XmlInheritedFrom`. Not applicable to this class.

```
public new long XmlInheritedFrom { set; get; }
```

ContentManager

8.50 and higher

The ContentManager class manages content (including HTML, text, documents, and digital media).

Namespace

```
Ektron.Cms.Framework.Content.ContentManager
```

Constructors

- `ContentManager()`
- `ContentManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `ContentService`. Returns an instance of the business objects Content Service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the facing page
- `Approve(Int64)`. Submits a content item for publishing.
- *AssignTaxonomy* on page 1080
- *Cancel* on page 1082
- *CheckIn* on page 1083
- *CheckOut* on page 1085
- *CopyContent* on page 1086
- *Delete* on page 1088

- `GetAssignedTaxonomyList(Int64,Int32)`. 8.70 and higher Retrieves a list of category or taxonomy data to which a given content is assigned.
- `GetContentByHistoryId(Int64)`. 8.60 and higher Retrieves the corresponding content by the history ID.
- `GetHistoryList(Int64)`. 8.60 and higher Retrieves a list of ContentHistoryData objects based on Content ID.
- `GetHtmlDifference(String,String)`. 8.60 and higher Returns the differences between 2 strings of content HTML.
- *GetItem* on page 1090
- *GetList (content collection criteria)* on page 1092
- *GetList (content criteria)* on page 1095
- *GetList (metadata criteria)* on page 1098
- *GetList (content taxonomy)* on page 1101
- *MoveContent* on page 1104
- *RemoveTaxonomy* on page 1106
- `Save(ContentData)`. 8.60 and higher Saves an existing content item in the CMS.
- *Submit* on page 1108
- *Update* on page 1110

Add

```
Add(Ektron.Cms.ContentData)
```

Adds content to the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- * Title
- Keywords (separate with a semicolon (;))
- Summary
- Private
- * HTML

Parameters

- `contentData`. The ContentData object to add to the CMS.

Returns

Returns the custom ContentData object added.

Remarks

When you add the content, the method returns a new Content ID. When you add content using this method, Web alerts are not sent.

AssignTaxonomy

```
AssignTaxonomy(System.Int64,System.Int64)
```

Assigns a content item from a taxonomy category.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * Taxonomy ID

Parameters

- `contentId`. ID of the content item to assign to a category.
- `categoryId`. ID of the taxonomy category to assign content to.

        }
    }
```

CopyContent

8.60 and higher

```
CopyContent(System.Int64,System.Int64,System.Int64,System.Boolean)
```

Copy content from one folder to another folder that specified as a folder ID.

Authenticated Users

- CMS Administrators

Fields

*=Required

- * Content ID
- * Folder ID
- * Language ID
- * Is Published

Parameters

- `contentId`. ID of the content item to be copied.
- `folderId`. ID of the folder into which the content is copied.
- `languageId`. ID of the language of the content item.
- `isPublish`. Determines whether the content is to be published.

Delete

```
Delete(System.Int64)
```

Deletes a content item from the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID

Parameters

- `contentId`. ID of the content item to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

        }
    }
```

GetList (content collection criteria)

```
GetList(Ektron.Cms.Content.ContentCollectionCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Collection Property
- * Object Value
- In Preview Mode

Parameters

- `criteria`. ContentCollectionCriteria used to retrieve content by collections.

Returns

List of ContentData objects matching the supplied criteria.

See *Criteria use for GetList methods* on page 156 for additional information.

NOTE: If the content you request does not exist in the current language, content is returned in fallback languages according to the fallback locale chain. However, if you request content in a specific language using a `CriteriaFilter`, the fallback languages are not returned because you are overriding the default language functionality and looking for specific content. For information about setting the fallback locale, see Setting the Fallback Locale.

    }
```

GetList (metadata criteria)

```
GetList(Ektron.Cms.Content.ContentMetadataCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content Property
- * Metadata ID
- * Value

Parameters

- `criteria`. ContentMetadataCriteria used to retrieve content.

Returns

List of ContentData objects matching the supplied criteria.

See *Criteria use for GetList methods* on page 156 for additional information.

NOTE: If the content you request does not exist in the current language, content is returned in fallback languages according to the fallback locale chain. However, if you request content in a specific language using a `CriteriaFilter`, the fallback languages are not returned because you are overriding the default language functionality and looking for specific content. For information about setting the fallback locale, see Setting the Fallback Locale in the Ektron Reference.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {

        try
        {
            ContentManager contentManager = new ContentManager();
            ContentData cData = new ContentData();
            long contentID = long.Parse(uxContentId.Text);
            bool result = Information.IsNumeric(uxContentId.Text);
            if (!((result)))
            {
                uxStatus.Visible = true;
                MessageUtilities.UpdateMessage(uxStatus, "Invalid Content ID",
Message.DisplayModes.Error);
                return;
            }
            contentManager.Submit(contentID);
            cData = contentManager.GetItem(contentID, false);
            if (cData.Status == "S")
            {
                MessageUtilities.UpdateMessage(uxMessage, "Content successfully
submitted and  its content id is : " + contentID + "and content Status is :" +
cData.Status, Message.DisplayModes.Success);
            }
            else {
            MessageUtilities.UpdateMessage(uxMessage,  "Content successfully published
and  its content id is : " + contentID + "and content Status is :" + cData.Status,
Message.DisplayModes.Success);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
```

```
        }

    }
```

Update

```
Update(Ektron.Cms.ContentData)
```

Updates an existing content item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- Title
- Keywords
- Summary
- HTML

Parameters

- `contentData`. The ContentData object to update.

Returns

Returns the custom ContentData object update.

Remarks

Validate the Content item with `GetItem()` before you update the properties. Then, call `Update` with your modified ContentData object.

NOTE: You cannot change all properties after the initial Add event, such as the ContentData.Type.

Data Classes

ContentCollectionCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `ContentCollectionCriteria()`

  ```
  public ContentCollectionCriteria()
  ```

- `ContentCollectionCriteria(Ektron.Cms.Common.ContentProperty, EkEnumeration.OrderByDirection)`

  ```
  public ContentCollectionCriteria(Ektron.Cms.Common.ContentProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ContentProperty` are:

  - ContentPath
  - DateCreated
  - DateModified
  - EndDate
  - EndDateActionType
  - ExpireDate
  - ExternalTypeId
  - FolderId
  - FolderName
  - GoLivedate
  - Id
  - InheritedFromId
  - IsArchived
  - IsPublished
  - IsSearchable
  - LanguageId
  - LastEditorFirstName
  - LastEditorLastName
  - Path
  - Status
  - SubType
  - Title
  - Type
  - UserId
  - XmlConfigurationId

Methods

- `AddFilter(Ektron.Cms.Common.ContentCollectionProperty, Ektron.Cms.Common.CriteriaFilterOperator, object)`. Adds a Filter to the criteria for filtering based upon a content collection.

```
public Ektron.Cms.Content.ContentCollectionFilterGroup AddFilter
(Ektron.Cms.Common.ContentCollectionProperty field,
Ektron.Cms.Common.CriteriaFilterOperator operator, object value)
```

- `AddFilter(string)`. Adds a Filter to the criteria for filtering based upon a content collection.

```
public Ektron.Cms.Content.ContentCollectionFilterGroup AddFilter(string
collectionName)
```

- `AddFilter(long)`. Adds a Filter to the criteria for filtering based upon a content collection.

```
public Ektron.Cms.Content.ContentCollectionFilterGroup AddFilter(long collectionId)
```

- `CollectionGroupFilters`

```
public System.Collections.Generic.List<ContentCollectionFilterGroup>
CollectionGroupFilters { set; get; }
```

- `GenerateSql(System.Data.Common.DbCommand, System.Collections.Generic.Dictionary<Ektron.Cms.Common.ContentProperty,string>, out string, out string)`

```
public override void
  GenerateSql(System.Data.Common.DbCommand command,
  System.Collections.Generic.Dictionary<ContentProperty,string>
  columnMap, out string whereClause, out string orderByClause)
```

- `OrderByCollectionOrder`. If true, will disregard OrderBy property and instead use predetermined content collection order.

```
public bool OrderByCollectionOrder { set; get; }
```

- `ToCacheKey()`

```
public override string ToCacheKey()
```

ContentCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `ContentCriteria()`

```
public ContentCriteria()
```

- `ContentCriteria(Ektron.Cms.Common.ContentProperty, EkEnumeration.OrderByDirection)`

```
public ContentCriteria(Ektron.Cms.Common.ContentProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `ContentProperty` are:

- ContentPath
- DateCreated
- DateModified
- EndDate
- EndDateActionType
- ExpireDate
- ExternalTypeId
- FolderId
- FolderName
- GoLivedate
- Id
- InheritedFromId

- IsPublished
- IsSearchable
- LanguageId
- LastEditorFirstName
- LastEditorLastName
- Path
- Status
- SubType
- Title
- Type
- UserId
- XmlConfigurationId

ContentData

Namespace

```
Ektron.Cms
```

Properties

- `ApprovalMethod`. Gets or sets the approval method of a content item for the ContentData object. Returns an integer value representing the type of approval method. If the content is inheriting the approval method from the folder, the IsInherited property must be false to change this property. Choices are:
  - 1 = Force All Approvers. Content checked-out during the approval process will force the approval chain to reset to the beginning.
  - 0 = Do Not Force All Approvers. Content checked-out during the approval process will continue through the approval chain.

```
public int ApprovalMethod { set; get; }
```

- `Approver`. Gets or sets the approvers of a content item for the `ContentData` object. Returns a string value representing the approvers of a content item.

```
public string Approver { set; get; }
```

- `Comment`. Gets or sets comment information associated with a content item for the `ContentData` object. Returns comment information associated with a content item.

```
public string Comment { set; get; }
```

- `ContentPath`. Gets or sets the Ektron CMS path to content item for the`ContentData` object, which includes the content title. For example, `folder1/Content Title`. Returns a string value representing the Ektron CMS path to the content item, including the content's title.

```
public string ContentPath { set; get; }
```

- `ContType`. Gets or sets the content type as an integer, should be 1 for content Returns an integer representing the content type.

```
public int ContType { set; get; }
```

- `DateCreated`. Gets or sets the creation date of a content item for the `ContentData` object. Returns a creation date of a content item as DateTime.

```
public System.DateTime DateCreated { set; get; }
```

- `DateModified`. Gets or sets the content's last edit date for the `ContentData` object. Returns a content's last edit date as a DateTime.

```
public System.DateTime DateModified { set; get; }
```

- `DisplayDateCreated`. Gets or sets the creation date of a content item formatted for display for the `ContentData` object. For example, June 11, 2014. Returns a creation date of a content item formatted for display.

```
public string DisplayDateCreated { set; get; }
```

- `DisplayEndDate`. Gets or sets the end date of a content item formatted for display. This is for the `ContentData` object. For example, June 11, 2014. Returns an end date of a content item formatted for display.

```
public string DisplayEndDate { set; get; }
```

- `DisplayGoLive`. Gets or sets the start date a content item goes live on the site formatted for display. This is for the `ContentData` object. For example, June 11, 2014. Returns a start date a content item goes live on the site formatted for display.

```
public string DisplayGoLive { set; get; }
```

- `DisplayLastEditDate`. Gets or sets the content's last edit date formatted for display for the `ContentData` object. For example, June 11, 2014. Returns a content's last edit date formatted for display.

```
public string DisplayLastEditDate { set; get; }
```

- `EditorFirstName`. Gets the content editor's first name for the `ContentData` object. This property is populated on retrieval, but is not persisted when saving `ContentData`. Returns an editor's first name as a string.

```
public string EditorFirstName { set; get; }
```

- `EditorLastName`. Gets the content editor's last name for the `ContentData` object. This property is populated on retrieval, but is not persisted when saving `ContentData`. Returns an editor's last name as a string.

```
public string EditorLastName { set; get; }
```

- `EditorUserNames`. Gets the username of the last editor of the content item for the `ContentData` object. This property is populated on retrieval, but is not persisted when saving `ContentData`. Returns a username of the last editor of the content item.

```
public string EditorUserNames { set; get; }
```

- `EndDate`. Gets or sets the end date of a content item. This is for the `ContentData` object. Returns a string value that represents the end date of a content item.

```
public string EndDate { set; get; }
```

- `EndDateAction`. Gets or sets the action to perform on a content item once the End Date has been reached. This is for the `ContentData` object. Returns an integer value representing one of the above end date action choices. Choices are:
  - 1 = Archive and remove from site (expire)
  - 2 = Archive and remain on site
  - 3 = Add to the CMS Refresh Report.

```
public int EndDateAction { set; get; }
```

- `EndDateActionType`. Gets or sets the End Action type.

```
public EkEnumeration.CMSEndDateAction EndDateActionType { set; get; }
```

- `ExpireDate`. Gets or sets the expire date of a content item. This is for the `ContentData` object. Returns a string value that represents the expire date of a content item.

```
public System.DateTime ExpireDate { set; get; }
```

- `FlagDefId`. Gets or sets the content item's Flag Defition Id for the `ContentData` object. Returns a content item's Flag Definition Id as long for the `ContentData` object.

```
public long FlagDefId { set; get; }
```

- `FolderId`. Gets or sets the content item's folder ID for the `ContentData` object. Reutns a folder ID as a long.

```
public long FolderId { set; get; }
```

- `FolderName`. Gets or sets the content item's folder name for the `ContentData` object. Returns the content item's folder name.

```
public string FolderName { set; get; }
```

- `GoLive`. Gets or sets the start date a content item goes live on the site. This is for the `ContentData` object. Returns a string value that represents the date a content item goes live.

```
public string GoLive { set; get; }
```

- `GoLiveDate`. Gets or sets the Golive date a content item goes live on the site. This is for the `ContentData` object. Returns a string value that represents the date a content item goes live.

```
public System.DateTime? GoLiveDate { set; get; }
```

- `HistoryId`. Gets or sets the content item's history ID for the `ContentData` object. Returns the numeric ID (Long) of the content item's history.

```
public long HistoryId { set; get; }
```

- `HyperLink`. Gets or sets the content item's Hyperlink in the Ektron CMS for the`ContentData` object. Returns a content item's Hyperlink information.

```
public string HyperLink { set; get; }
```

- `InheritedFrom`. Gets or sets the folder ID from which to inherit permissions for the `ContentData`object. Returns a numeric ID representing the folder from which permissions are inherited.

```
public long InheritedFrom { set; get; }
```

- `IsInherited`. Gets or sets whether the content item inherits permissions from the folder settings for the `ContentData` object. Returns a boolean that returns true when the content item inherits permissions from the folder settings.

```
public bool IsInherited { set; get; }
```

- `IsMetaComplete`. This property is deprecated.

```
public bool IsMetaComplete { set; get; }
```

- `IsPermissionsInherited`. Gets or sets whether the content item inherits permissions from the folder settings for the `ContentData` object. Returns a boolean that returns true when the content item inherits permissions from the folder settings.

```
public bool IsPermissionsInherited { set; get; }
```

- `IsPublished`. Gets or sets whether the content is published before for the `ContentData` object. Returns a boolean based on whether the content is published before. True = Published

```
public bool IsPublished { set; get; }
```

- `IsSearchable`. Gets or sets whether the content is searchable for the `ContentData` object. Returns a boolean based on whether the content is searchable.
  - True = content is searchable.
  - False = content is not searchable.

```
public bool? IsSearchable { set; get; }
```

- `IsSearchableAsBool`. XML comment contains invalid XML: End tag 'returns' does not match the start tag 'summary'.

```
public bool IsSearchableAsBool { set; get; }
```

- `IsXmlInherited`. Gets or sets whether the XML Smart Form configuration is inherited from the folder. This is for the `ContentData` object. Returns a boolean based on whether the XML Smart Form configuration is inherited from the folder.

- True = content XML Smart Form configuration is inherited from the folder.
- False = content XML Smart Form configuration is not inherited from the folder.

```
public bool IsXmlInherited { set; get; }
```

- `LanguageDescription`

```
public string LanguageDescription { set; get; }
```

- `LastEditDate`. This property is deprecated: Use DateModified, which returns a DateTime rather than a string. Gets or sets the content's last edit date for the `ContentData` object. Returns a content's last edit date as a string.

```
public string LastEditDate { set; get; }
```

- `LegacyData`. Gets or sets the Legacy Data of a content item as an Object of `ContentMetadata`. This is for the `ContentData` object. Returns Legacy Data as an Object of `ContentMetaData`.

```
public object LegacyData { set; get; }
```

- `ManualAlias`. Gets or sets the manual alias by its name for the `ContentData` object. For example, `/~YourSite~/text.aspx`. Returns a string value representing the name of a manual alias.

```
public string ManualAlias { set; get; }
```

- `ManualAliasId`. Gets or sets the ID of the of a manual alias for the `ContentData` object. Returns a numeric value (`Long`) representing a manual alias ID.

```
public long ManualAliasId { set; get; }
```

- `MediaText`. Gets or sets any `MediaText` associated with the `ContentData` object. Returns Media Text associated with `ContentData` object item.

```
public string MediaText { set; get; }
```

- `MetaData`. Gets or sets the Metadata of a content item as an array of `ContentMetadata`. This is for the `ContentData` object. Returns metadata as an array of `ContentMetaData`.

```
public Ektron.Cms.ContentMetaData[] MetaData { set; get; }
```

- `Path`. Gets or sets the Ektron CMS path to content item for the`ContentData`object. Returns a string value representing the Ektron CMS path to the content item.

```
public string Path { set; get; }
```

- `PermissionInheritedFrom`. Gets or sets the folder ID from which to inherit permissions for the `ContentData` object. Returns a numeric ID representing the folder from which permissions are inherited.

```
public long PermissionInheritedFrom { set; get; }
```

- `Permissions`. Gets or sets permission data for the `ContentData` object. Permissions as a `PermissionData` object.

```
public Ektron.Cms.PermissionData Permissions { set; get; }
```

- `Status`. This property should be considered read-only. This value is managed by the Ektron approval workflow (if any) attached to the item. Gets the letter value

representing the status of a content item for the `ContentData` object. Returns a letter value representing the status of a content item.

- A = Approved
- D = Pending Deletion.
- I = Checked In
- M = Marked for Deletion
- O = Checked Out
- P = Pending Go Live Date
- S = Submitted for Approval
- T = Awaiting Completion of Associated Tasks

```
public string Status { set; get; }
```

- `StyleSheet`. Gets or sets the style sheet to use with a content item for the `ContentData` object. Returns a string value representing the style sheet to use with a content item.

```
public string StyleSheet { set; get; }
```

- `TemplateCnfiguration`. Gets or sets the content item's template configuration for the `ContentData` object. Returns a content item's template configuration as `TemplateData`.

```
public Ektron.Cms.TemplateData TemplateConfiguration { set; get; }
```

- `Text`. Gets or sets a string value representing the Ektron CMS`ContentData`object. Returns a string value representing the Ektron CMS`ContentData` object.

```
public string Text { set; get; }
```

- `Updates`. Gets or sets the updates information associated with the `ContentData` object. Returns updates of type `Integer`.

```
public int Updates { set; get; }
```

- `UserId`. Gets or sets the ID of the user for the `ContentData` object. Returns a User ID as a `Long`.

```
public long UserId { set; get; }
```

- `UserName`. This property is obsolete. To retrieve the user name, call `EkUser GetActiveUserbyID` with the correct User ID. Returns the content's username. Gets or sets the content's username for the `ContentData` object.
-

```
public string UserName { set; get; }
```

- `Validate()`. Validation method for this object; returns a `ValidationResults` instance.

```
public override ValidationResults Validate()
```

- `XmlConfiguration`. Gets or sets the content item's XML configuration for the `ContentData` object. Returns a content item's XML configuration as `XmlConfigData`.

```
public XmlConfigData XmlConfiguration { set; get; }
```

- `XmlInheritedFrom`. Gets or sets the ID of the folder from which the XML Smart Form configuration is inherited. This is for the `ContentData` object. Returns a

numeric ID (`Long`) of the folder from which the XML Smart Form configuration is inherited.

```
public long XmlInheritedFrom { set; get; }
```

ContentMetadataCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `ContentMetadataCriteria()`

  ```
  public ContentMetadataCriteria()
  ```

- `ContentMetadataCriteria(Ektron.Cms.Common.ContentProperty, EkEnumeration.OrderByDirection)`

  ```
  public ContentMetadataCriteria(Ektron.Cms.Common.ContentProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ContentProperty` are:

  - ContentPath
  - DateCreated
  - DateModified
  - EndDate
  - EndDateActionType
  - ExpireDate
  - ExternalTypeId
  - FolderId
  - FolderName
  - GoLivedate
  - Id
  - InheritedFromId
  - IsArchived
  - IsPublished
  - IsSearchable
  - LanguageId
  - LastEditorFirstName
  - LastEditorLastName
  - Path
  - Status
  - SubType
  - Title

- Type
- UserId
- XmlConfigurationId

Methods

- `AddFilter(ContentMetadatatProperty, operator, value)`. Filters the results based on the condition defined in this method.

```
criteria.addFilter(ContentMetadataProperty field, CriteriaFilterOperator
filterOperator , object value );
```

- `GenerateSql(System.Data.Common.DbCommand, System.Collections.Generic.Dictionary<Ektron.Cms.Common.ContentProperty,string>, out string, out string)`

```
public override void
  GenerateSql(System.Data.Common.DbCommand command,
  System.Collections.Generic.Dictionary<ContentProperty,string>
  columnMap, out string whereClause, out string orderByClause)
```

- `ToCacheKey()`

```
public override string ToCacheKey()
```

- `MetadataFilterGroups`

```
public System.Collections.Generic.List<ContentMetadataFilterGroup>
  MetadataFilterGroups { set; get; }
```

ContentTaxonomyCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `ContentTaxonomyCriteria()`

```
public ContentTaxonomyCriteria()
```

- `ContentTaxonomyCriteria(Ektron.Cms.Common.ContentProperty, EkEnumeration.OrderByDirection)`

```
public ContentTaxonomyCriteria(Ektron.Cms.Common.ContentProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `ContentProperty` are:

- ContentPath
- DateCreated
- DateModified
- EndDate
- EndDateActionType
- ExpireDate

- ExternalTypeId
- FolderId
- FolderName
- GoLivedate
- Id
- InheritedFromId
- IsArchived
- IsPublished
- IsSearchable
- LanguageId
- LastEditorFirstName
- LastEditorLastName
- Path
- Status
- SubType
- Title
- Type
- UserId
- XmlConfigurationId

Methods

- `AddFilter(string, [bool])`

```
public Ektron.Cms.Content.ContentTaxonomyFilterGroup
 AddFilter(string taxonomyPath, [bool recursive = false])
```

- `AddFilter(long, [bool])`

```
public Ektron.Cms.Content.ContentTaxonomyFilterGroup
 AddFilter(long taxonomyId, [bool recursive = false])
```

- `GenerateSql(System.Data.Common.DbCommand, System.Collections.Generic.Dictionary<Ektron.Cms.Common.ContentProperty,string>, out string, out string)`

```
public override void
 GenerateSql(System.Data.Common.DbCommand command,
 System.Collections.Generic.Dictionary<ContentProperty,string>
 columnMap, out string whereClause, out string orderByClause)
```

- `TaxonomyGroupFilters`

```
public System.Collections.Generic.List<ContentTaxonomyFilterGroup>
 TaxonomyGroupFilters { set; get; }
```

- `ToCacheKey()`

```
public override string ToCacheKey()
```

ContentRatingManager

8.50 and higher

The ContentRatingManager class manages user valuations on content.

Namespace

```
Ektron.Cms.Framework.Content.ContentRatingManager
```

Constructors

- `ContentRatingManager()`
- `ContentRatingManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `ContentRatingService`. Returns an instance of the business objects Content Rating Service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.contentRatingTypeData)
```

Adds a content rating type.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * User Rating
- User Comments

Parameters

- `contentRating`. The ContentRatingData object.

Returns

The custom ContentRatingData object added.

```

Delete

```
Delete(System.Int64)
```

Deletes a content rating type from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content Rating ID

Parameters

- `contentRatingId`. The ID of the content rating type to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

Purge

```
Purge(System.Int64,System.DateTime,System.DateTime)
```

Purges all ratings of a particular content block over a defined date/time range.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * Start Date Time
- * End Date Time

Parameters

- `contentId`. The ID of the content that is having its ratings purged.
- `startDate`. The beginning of the date range of content to be purged.
- `endDate`. The end of the date range of content to be purged.

.aspx code snippet

```

        }

    }
```

Update

```
Update(Ektron.Cms.ContentRatingData)
```

Updates an existing content rating item in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content Rating ID
- * User Rating
- User Comments

Parameters

- `contentRating`. The ContentRatingtData object.

Returns

The custom ContentRatingData object updated.

Remarks

Validate the content rating item with `GetItem()` before you update the properties. Then, call `Update` with your modified ContentRatingData object.

NOTE: You cannot change all properties after the initial Add event, such as the ContentRatingData.Type.

Data Classes

ContentRatingCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Properties

- `ContentRatingCriteria()`

  ```
  public ContentRatingCriteria()
  ```

- `ContentRatingCriteria(Ektron.Cms.Common.ContentRatingProperty, EkEnumeration.OrderByDirection)`

  ```
  public ContentRatingCriteria(Ektron.Cms.Common.ContentRatingProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ContentRatingProperty` are:

  - ContentId
  - ContentLanguageId
  - ContentReviewState
  - Id
  - RatingDate
  - RatingState
  - UserId
  - VistorId

ContentRatingData

Namespace

```
Ektron.Cms
```

Properties

- `ContentId`

  ```
  public long ContentId { set; get; }
  ```

- `ContentLanguageId`

  ```
  public int ContentLanguageId { set; get; }
  ```

- `ContentReviewState`

  ```
  public Ektron.Cms.Common.EkEnumeration.ContentReviewState
    ContentReviewState { set; get; }
  ```

- `RatingDate`

  ```
  public System.DateTime RatingDate { set; get; }
  ```

- `UserComments`

  ```
  public string UserComments { set; get; }
  ```

- `UserId`

  ```
  public long UserId { set; get; }
  ```

- `UserRating`

  ```
  public int UserRating { set; get; }
  ```

- VisitorId

```
public string VisitorId { set; get; }
```

LibraryManager

8.50 and higher

The LibraryManager class manages libraries, which stores images, files, quicklinks, and hyperlinks that can be inserted into editor content.

Namespace

```
Ektron.Cms.Framework.Content.LibraryManager
```

Constructors

- `LibraryManager()`
- `LibraryManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `LibraryManagerService`. Returns an instance of the business objects library manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1146
- *GetItem* on page 1147
- `GetLibraryItemByContentId(Int64,Int32)`. 8.60 and higher Retrieves a `LibraryData` object based upon the content ID.
- *GetList* on page 1149
- *Update* on page 1152

Add

```
Add(Ektron.Cms.LibraryData)
```

Adds a library based on information in a LibraryData object.

The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- * Type ID
- * Title
- * File Name
- * Language ID

Parameters

- `libraryData`. The LibraryData object to add.

Returns

Returns the custom LibraryData object added.

    }
```

GetItem. Retrieves a single LibraryData object from the CMS.

GetItem

```
GetItem(System.Int64)
```

Retrieves a single LibraryData object from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Library ID

Parameters

- `id`. The ID of the library to retrieve.

        }
    }
```

Update

```
Update(Ektron.Cms.LibraryData)
```

Updates an existing LibraryData item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Library ID
- Title
- File Name

Parameters

- `libraryData`. The LibraryData object to update.

Returns

Returns the custom LibraryData object updated

Remarks

Validate the library item with `GetItem()` before you update the properties. Then, call `Update` with your modified LibraryData object.

NOTE: You cannot change all properties after the initial Add event, such as the LibraryData.Type.

Data Classes

LibraryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Properties

- `LibraryCriteria()`

  ```
  public LibraryCriteria()
  ```

- `LibraryCriteria(Ektron.Cms.Common.LibraryProperty, EkEnumeration.OrderByDirection)`

```
public LibraryCriteria(Ektron.Cms.Common.LibraryProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `LibraryProperty` are:

- ContentId
- ContentType
- CreatedDate
- Id
- LanguageId
- LastEditDate
- ParentId
- TypeId
- UserId

LibraryData

Namespace

```
Ektron.Cms
```

Properties

- `ContentId`. Gets or sets the content's ID for the `LibraryData` object. Returns the content's long ID.

  ```
  public long ContentId { set; get; }
  ```

- `ContentSubType`. Gets or sets the content sub type for the LibraryData object. Returns the content sub type.

  ```
  public Ektron.Cms.Common.EkEnumeration.CMSContentSubtype
    ContentSubType { set; get; }
  ```

- ContentType. Gets or sets the content type for the LibraryData object. Possible values are defined in Ektron.Cms.Common.EkEnumeration.CMSContentType enumeration. Returns the content type.

  ```
  public int ContentType { set; get; }
  ```

- `DateCreated`. Gets or sets the date created for the LibraryData object. Returns the date created.

  ```
  public System.DateTime DateCreated { set; get; }
  ```

- `DisplayDateCreated`. Gets or sets the date created to show for the LibraryData object. Returns the date created to show.

  ```
  public string DisplayDateCreated { set; get; }
  ```

- `DisplayLastEditDate`. Gets or sets the last edit date to show for the LibraryData object. Returns the last edit date to show.

  ```
  public string DisplayLastEditDate { set; get; }
  ```

- `EditorFirstName`. Gets or sets the Editor's first name for the LibraryData object. Returns the Editor's first name.

  ```
  public string EditorFirstName { set; get; }
  ```

- `EditorLastName`. Gets or sets the Editor's last name for the LibraryData object. Returns the Editor's last name.

```
public string EditorLastName { set; get; }
```

- `FolderName`. Gets or sets the folder's name for the LibraryData object. Returns the folder's name.

```
public string FolderName { set; get; }
```

- `Html`. Gets or sets the HTML for this library item. Many library items will not have corresponding HTML.

```
public string Html { set; get; }
```

- `IsPrivate`. This property should be considered read-only. The value will be set to match the items parent folder privacy setting. Returns true if the library is private. Otherwise, returns false.

```
public bool IsPrivate { set; get; }
```

- `LastEditDate`. Gets or sets the last edit date for the LibraryData object. Returns the last edit date.

```
public string LastEditDate { set; get; }
```

- `MetaData`. Gets or sets the content metadata list for the LibraryData object. Returns the content metadata list.

```
public Ektron.Cms.ContentMetaData[] MetaData { set; get; }
```

- `OriginalLibraryId`. The Id of the original library item. For example, when dealing with a thumbnail image, this is the master image it was generated from. Returns the Id of the original library item.

```
public long OriginalLibraryId { set; get; }
```

- `ParentId`. Gets or sets the parent's ID for the LibraryData object. Returns the parent's long ID.

```
public long ParentId { set; get; }
```

- `Relative`. Gets or sets the Relative for the LibraryData object. Returns the Relative.

```
public int Relative { set; get; }
```

- `Taxonomies`. Gets or sets the taxonomy data for this LibraryData object. Returns the taxonomydata list.

```
public Ektron.Cms.TaxonomyBaseData[] Taxonomies { set; get; }
```

- `Teaser`. Gets or sets the teaser for the LibraryData object. Returns the teaser.

```
public string Teaser { set; get; }
```

- `UserId`. Gets or sets the user's ID for the LibraryData object. Returns the library user's long ID.

```
public long UserId { set; get; }
```

MetadataTypeManager

8.50 and higher

The MetadataTypeManager class manages metadata types, such as title and other artifacts. For information about metadata types and definitions, see Working with Metadata in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Content.MetadataTypeManager
```

Constructors

- `MetadataTypeManager()`
- `MetadataTypeManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MetadataTypeService`. Returns an instance of the business objects MetadataType Service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.ContentMetaData)
```

Adds a new metadata type.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Title
- Editable
- Search Allowed
- Default Text
- Seperator

Parameters

- `metadata`. The ContentMetaData object.

Returns

Returns the custom ContentMetaData object added.

            MessageUtilities.UpdateMessage(uxMessage, "Metadata type Added with Id " +
cMetaTypeData.Id, Message.DisplayModes.Success);

            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
```

```
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a metadata type from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Metadata Type ID

Parameters

- `metadataTypeId`. The ID of the metadata type to be deleted.

Remarks

Validate the item using `GetItem()` before deleting.

.aspx code snippet

```
<ol class="formFields">
        <li class="clearfix">
            <ektronUI:Label ID="uxMetaTypeIdLabel" AssociatedControlID="uxMetaTypeId"

Update

```
Update(Ektron.Cms.ContentMetaData)
```

Updates an existing content metadata item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Metadata Type ID
- Title
- * Editable
- * Search Allowed
- Default Text
- Separator

Parameters

- `metadata`. The ContentMetaData object.

Returns

Returns the custom ContentMetaData object updated.

Remarks

Validate the ContentMetadata item with `GetItem()` before you update the properties. Then, call `Update` with your modified ContentMetaData object.

NOTE: You cannot change all properties after the initial Add event, such as the ContentMetaData.Type.\

```
public long TypeId { set; get; }
```

- `TypeName`

```
public string TypeName { set; get; }
```

- `Validate()`. Validate this instance.

```
public override ValidationResults Validate()
```

MetadataTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Properties

- `MetadataTypeCriteria()`

```
public MetadataTypeCriteria()
```

- `MetadataTypeCriteria(Ektron.Cms.Content.MetadataTypeProperty, EkEnumeration.OrderByDirection)`

```
public MetadataTypeCriteria(Ektron.Cms.Content.MetadataTypeProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `MetadataTypeProperty` are:

- Id
- Language
- Name

- ObjectType
- Required

TemplateManager

8.50 and higher

The TemplateManager class manages templates, which typically includes page headers, footers, and placeholders for content, forms, summaries, calendars, collections, or other page elements. For information about templates, see Working with Templates in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Content.TemplateManager
```

Constructors

- `TemplateManager()`
- `TemplateManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TemplateService`. Returns an instance of the business objects Template Service.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.TemplateData)
```

Adds a template based on information in a TemplateData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Template Name
- Description
- * Template File

Parameters

- `templateData`. The TemplateData object to add.

Returns

TemplateData object added.

Delete

```
Delete(System.Int64)
```

Deletes a template from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Template ID

Parameters

- `templateId`. The ID of the template to delete.

Remarks

Validate the item using `GetItem()` before deleting.

GetItem

```
GetItem(Ektron.Cms.TemplateData)
```

Retrieves the properties of a specific TemplateData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Template ID

Parameters

- `templateId`. The ID of the template to retrieve.

Returns

TemplateData object found.

GetList

```
GetList(Ektron.Cms.Common.TemplateCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Template Property
- * Object Value

Parameters

- `criteria`. Object used to perform filtering based on several TemplateData object properties.

Returns

A list of TemplateData objects found.

See *Criteria use for GetList methods* on page 156 for additional information.

Update

```
Update(Ektron.Cms.TemplateData)
```

Updates an existing Template item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Template ID
- Template Name
- Description
- Template File

Parameters

- `templateData`. The TemplateData object to update.

Returns

Returns the custom TemplateData object updated.

Remarks

Validate the Template item with `GetItem()` before you update the properties. Then, call `Update` with your modified TemplateData object.

NOTE: You cannot change all properties after the initial Add event, such as the TemplateData.Type.

Flag

8.60 and higher

The Flag manager category manages a means by which an end user provides feedback about content (because the content is offensive, or because the user likes the content). The feedback goes to an administrator or moderator for action. It has the following class.

- *FlagDefinitionManager* on the facing page

FlagDefinitionManager

8.60 and higher

The class manages a means by which an end user provides feedback about content (because the content is offensive, or because the user likes the content). The feedback goes to an administrator or moderator for action.

Namespace

```
Ektron.Cms.Framework.Flag.FlagDefinitionManager
```

Constructors

- `FlagDefinitionManager()`
- `FlagDefinitionManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `FlagDefinitionManagerService`. Returns an instance of the business objects flag definition manager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1189
- *GetItem* on page 1191
- *GetList* on page 1193
- *Update* on page 1196

Add

```
Add(Ektron.Cms.FlagDefData)
```

Adds a flag based on information in FlagDefData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- Description
- * Flag Item Title
- Flag Item Description

Parameters

- `FlagDefinitionData`. The flag object to add.

Returns

FlagDefData object added.

    }
```

Delete

```
Delete(System.Int64)
```

Deletes a flag from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of the flag to delete.

Remarks

Validate the item using `GetItem()` before deleting.

Update

```
Update(Ektron.Cms.FlagDefData)
```

Updates an existing flag item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Title
- * Item ID
- * Item Title

Parameters

- `FlagDefinitionData`. The FlagDefData object to update.

Returns

Returns the FlagDefData object updated.

Remarks

Validate the FlagDefData item with `GetItem()` before you update the properties. Then, call `Update` with your modified FlagDefData object.

NOTE: You cannot change all properties after the initial Add event.

```
public string m_strName { set; get; }
```

- `Name`

```
public string Name { set; get; }
```

FlagDefinitionCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Flag
```

Properties

- `FlagDefinitionCriteria()`

```
public FlagDefinitionCriteria()
```

- `FlagDefinitionCriteria(Ektron.Cms.Common.FlagDefProperty, EkEnumeration.OrderByDirection)`

```
public FlagDefinitionCriteria(Ektron.Cms.Common.FlagDefProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

  Accepted fields for the `FlagDefinitionProperty` are:

  - FlagDefDescription
  - FlagDefLanguage
  - FlagDefName
  - FlagLastEditDate
  - Id
  - IsCommunityFlag

Notifications

8.50 and higher

The Notifications manager category manages information that is sent to users and has the following class:

- *NotificationManager* below

NotificationManager

8.50 and higher

The NotificationManager class manages data that is sent to users.

Namespace

```
Ektron.Cms.Framework.Notifications.NotificationManager
```

Constructors

- `NotificationManager()`
- `NotificationManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `IsNotificationReplyMessagePrepended`. Gets setting indicating if the Notification Email Reply message should be prepended to the notification email.
- `NotificationService`. Notification Service
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Send (activity data)* below
- *Send (message data)* on page 1203

Send (activity data)

```
Send(Ektron.Cms.Activity.ActivityData)
```

Sends notifications based upon the supplied activity.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * Activity Message

Parameters

- `activity`. The ActivityData object that has occurred and will result in notifications being sent. The Activity.Message property is ignored and is retrieved based upon CMS message settings.

and Try again.", Message.DisplayModes.Error);
            }

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
```

```
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

Send (message data)

```
Send(Ektron.Cms.Notifications.NotificationMessageData)
```

Sends notifications based upon the supplied notification message data.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * Subject
- * Activity Message
- * User ID

Parameters

- `notificationMessage`. NotificationMessageData object defining message to send and the user to whom to send it.

```

Data Classes

ActivityData

Namespace

```
Ektron.Cms.Activity
```

Properties

- `ActionUser`. Gets or sets the user who caused this activity to occur. For example, the user who posted a blog post or uploaded a document.

  ```
  public Ektron.Cms.Activity.ActivityUserInfo ActionUser { set; get; }
  ```

- `ActivityData()`

  ```
  public ActivityData()
  ```

- `ActivityData(long, long, long)`

  ```
  public ActivityData(long activityTypeId, long objectId,
    long actionUserId)
  ```

- `ActivityData(long, long, long, int, string)`

  ```
  public ActivityData(long activityTypeId, long objectId,
    long actionUserId, int languageId, string message)
  ```

- `ActivityTypeId`. Gets or sets the ActivityType for this Activity. Built in CMS Activity are defined in `EkEnumeration.ActivityType`.

  ```
  public long ActivityTypeId { set; get; }
  ```

- `CanComment`. Gets or sets the CanComment permissions for the activity.

  ```
  public bool CanComment { set; get; }
  ```

- `CommentCount`. Gets or sets the Comment count for the activity.

  ```
  public int CommentCount { set; get; }
  ```

- `Comments`. Gets or sets the Comments for the activity. This property will not be populated unless explicitly specified when calling API. To get the total comment count, see `CommentCount` property.

  ```
  public System.Collections.ObjectModel.Collection<ActivityCommentData>
    Comments { set; get; }
  ```

- `Date`. Gets or sets the date the activity occurred.

```
public System.DateTime Date { set; get; }
```

- `Id`. Gets or set the ID of the activity.

```
public long Id { set; get; }
```

- `LanguageId`. Gets or sets the language associated with this activity's message.

```
public int LanguageId { set; get; }
```

- `Message`. Gets or sets the message for this activity.

```
public string Message { set; get; }
```

- `ObjectId`. Gets or sets the ID of the object associated with this activity.

```
public long ObjectId { set; get; }
```

- `ScopeObjectId`. Gets or sets the ID of the scope object associated with this activity.

```
public long ScopeObjectId { set; get; }
```

- `SiteId`. Gets or sets the ID of the site that the activity originated from.

```
public long SiteId { set; get; }
```

- `TimeLapse`. Gets the time lapse for the activity.

```
public string TimeLapse { set; get; }
```

- `UniqueId`. Gets or sets the unique ID for the activity.

```
public System.Guid UniqueId { set; get; }
```

- `Validate()`. Validates the current ActivityData instance is in a valid state for saving. Returns collection of validation errors if not valid.

```
public ValidationResults Validate()
```

NotificationMessageData

Namespace

```
Ektron.Cms.Notifications
```

Properties

- `Activity`. Gets or sets the Activity associated with the notification. This may be required for some notifications, but not all. The ActivityFeed, for one, provider requires it.

```
public Ektron.Cms.Activity.ActivityData Activity { set; get; }
```

- `Document`. Gets or sets the document associated with the notification message. May be null.

```
public byte[] Document { set; get; }
```

- `DocumentTitle`. Gets or sets the document title associated with the notification message. May be null.

```
public string DocumentTitle { set; get; }
```

- `HtmlMessage`. Gets or sets the HTML message of the notification. This message would be used by providers that support HTML based messages.

```
public string HtmlMessage { set; get; }
```

- `NotificationMessageData()`

```
public NotificationMessageData()
```

- `NotificationMessageData(string, string, string, Ektron.Cms.Notifications.UserNotificationData)`

```
public NotificationMessageData(string htmlMessage,
  string textMessage, string subject,
  Ektron.Cms.Notifications.UserNotificationData userNotification)
```

- `NotificationMessageData(string, string, string, Ektron.Cms.Notifications.UserNotificationData, Ektron.Cms.Activity.ActivityData)`

```
public NotificationMessageData(string htmlMessage,
  string textMessage, string subject,
  Ektron.Cms.Notifications.UserNotificationData
  userNotification, Ektron.Cms.Activity.ActivityData activity)
```

- `Subject`. Gets or sets the subject of the notification.

```
public string Subject { set; get; }
```

- `TextMessage`. Gets or sets the text message of the notification. This message would be used by providers that send messages in plain text and not HTML.

```
public string TextMessage { set; get; }
```

- `UserNotification`. Gets or sets the UserNotificationData for this notification.

```
public Ektron.Cms.Notifications.UserNotificationData
  UserNotification { set; get; }
```

Organization

8.50 and higher

The Organization manager category manages things that help organize content and has the following classes:

- *CollectionManager* on the next page. Manages a list of content.
- *FolderManager* on page 1231. Manages Ektron CMS folders.
- *MenuManager* on page 1263. Manages drop down menus for your Web site.
- *TaxonomyItemManager* on page 1294. Manages taxonomy items.
- *TaxonomyManager* on page 1310. Manages taxonomies.

CollectionManager

8.50 and higher

The CollectionManager class manages a list of content. Information about collections is at Working with Collections in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Organization.CollectionManager
```

Constructors

- `CollectionManager()`
- `CollectionManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `CollectionManagerService`. Returns an instance of the business objects task manager service.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.ContentCollectionData)
```

Adds a content collection based on information in an ContentCollectionData object.

Authenticated users

- CMS Administrators
- Collection Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Folder ID
- Recursive
- Summary

Parameters

- `contentCollectionData`. The ContentCollectionData object to add.

Returns

Returns the custom CmsData object added.

                    Description = uxCollectionDescription.Text,
                    Recursive = uxRecursive.Checked
                };

            collectionManager.Add(contentcollData);

            MessageUtilities.UpdateMessage(uxMessage, "Collection Added with Id " +
contentcollData.Id, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);

        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
```

```
        }
    }
```

AddContent

```
AddContent(System.Int64,System.Int64)
```

Adds a content item to a collection.

Authenticated users

- CMS Administrators
- Collection Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Collection ID
- * Content ID

Parameters

- `collectionId`. The ID of the content collection.
- `contentId`. The ID of the content.

Delete

```
Delete(System.Int64)
```

Deletes a content collection from the CMS.

Authenticated users

- CMS Administrators
- Collection Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of the content collection to delete.

Remarks

Validate the item using `GetItem()` before deleting.

```

```
        }
    }
```

Update

```
Update(Ektron.Cms.ContentCollectionData)
```

Updates an existing Content Collection item in the CMS.

Authenticated users

- CMS Administrators
- Collection Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Title
- * Recursive
- Summary

Parameters

- `contentCollectionData`. The ContentCollectionData object to update.

Returns

Returns the custom CmsData object update.

Remarks

Validate the content collection item with `GetItem()` before you update the properties. Then, call `Update` with your modified ContentCollectionData object.

NOTE: You cannot change all properties after the initial Add event, such as the ContentCollectionData.Type.

```

UpdateItemOrder

```
UpdateItemOrder(System.Int64,System.Collections.Generic.IEnumerable)
```

Updates the contents of a collection.

Authenticated users

- CMS Administrators
- Collection Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Collection ID
- * Content ID List (comma separated collection's content IDs)

Parameters

- `collectionId`. The ID of the content collection.
- `contentIdlist`. The IDs of the contents.

Data Classes

CollectionCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Properties

- `CollectionCriteria()`

```
public CollectionCriteria()
```

- `CollectionCriteria(Ektron.Cms.Common.CollectionProperty, EkEnumeration.OrderByDirection)`

```
public CollectionCriteria(Ektron.Cms.Common.CollectionProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `CollectionProperty` are:

- DateCreated
- Description
- FolderId
- HasBeenPublished
- Id
- IsApprovalRequired
- IsPublished
- LastEditDate
- Status
- Template
- Title
- UserId

ContentCollectionData

Namespace

```
Ektron.Cms.Organization
```

Properties

- `DateCreated`. Gets or sets the date thiscCollection was created.

```
public System.DateTime DateCreated { set; get; }
```

- `Description`. Gets or sets the collection's description.

```
public string Description { set; get; }
```

- DynamicReplicationMethod. Gets or sets a value representing the dynamic replication method to utilize.

```
public bool DynamicReplicationMethod { set; get; }
```

- `EditorFName`. Gets ot sets the Editor's First Name.

```
public string EditorFName { set; get; }
```

- `EditorLName`. Gets or sets the Editor's Last Name.

```
public string EditorLName { set; get; }
```

- `EnableReplication`. Gets or sets a value indicating whether replication is enabled on this item (1=Enabled, 0=Disabled).

```
public int EnableReplication { set; get; }
```

- `FolderId`. Path Folder Id.

```
public long FolderId { set; get; }
```

- `Id`. Gets or sets the ID that identified this object uniquely.

```
public long Id { set; get; }
```

- `IsApprovalRequired`. Gets or sets a true or false value indicating whether approval is required for this Collection.

```
public bool IsApprovalRequired { set; get; }
```

- `LastEditDate`. Gets or sets the last Edit Date.

```
public System.DateTime LastEditDate { set; get; }
```

- `Published`. Gets or sets a integer value that indicates whether the Collection is published or not (1=Published, 0=Not Published).

```
public bool Published { set; get; }
```

- `Recursive`. Gets or sets a true or false value indicating whether to include subfolders.

```
public bool Recursive { set; get; }
```

- `Status`. Content Status:
  - A-Approved
  - D-Pending deletion
  - I-Checked in
  - M-Marked for deletion
  - O-Checked out
  - P-Pending go live date
  - S-Submitted for approval
  - T-Awaiting completion of associated tasks

```
public string Status { set; get; }
```

- `Template`. Gets or sets a template URL for the items in the collection, leave blank to use the item's quicklinks.

```
public string Template { set; get; }
```

- `Title`. Gets or sets the collection's title.

```
public string Title { set; get; }
```

- `UserId`. Gets or sets the user id that represents the author of this collection.

```
public long UserId { set; get; }
```

- `Validate()`. Validate this collection. Returns true for valid data, false for invalid data.

```
public override ValidationResults Validate()
```

FolderManager

8.50 and higher

The FolderManager class manages Ektron CMS folders. See also Setting Up Your CMS Folder Structure in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Organization.FolderManager
```

Constructors

- `FolderManager()`
- `FolderManager(ApiAccessMode)`

Properties

- `FolderService`. Gets instance to IFolder.

Methods

- *Add* on the next page
- *AllowTaxonomy* on page 1234
- *AssignMetadata* on page 1236
- `CopyFolder(Int64,Int64,Boolean,Boolean)`. 8.60 and higher Copy the folder from one parent folder to another parent folder.
- *Delete* on page 1238
- *DisableTaxonomy* on page 1239
- *EnableTaxonomy* on page 1241
- `GetAssignedFolders(Int64)`. 8.60 and higher Retrieves the list of folders assigned to the given taxonomy.
- `GetAssignedMetadata(Int64)`. 8.60 and higher Returns a list of content metadata assigned to a given folder.
- *GetAssignedTaxonomy* on page 1243
- *GetItem* on page 1246
- *GetList* on page 1248
- `GetSitemapPath(Int64)`. 8.60 and higher Returns the specified `sitemappath` object for a given folder. To get sitemappaths in different languages, change the manager's `ekRequestInformation` Language.
- `GetTree(Int64)`. 8.60 and higher

- `IsCommunityFolder(Int64)`. 8.60 and higher Returns true if the folder is a Community Folder.
- *LinkTaxonomy* on page 1251
- `MoveFolder(Int64,Int64,Boolean)`. 8.60 and higher Move the folder from existing parent folder to another parent folder.
- `Purge(Int64,DateTime,Boolean,Boolean)`. 8.60 and higher Purge the content history values for the folder until the specified date criteria.
- *UnallowTaxonomy* on page 1253
- *UnassignMetadata* on page 1255
- `UnAssignTemplate(Int64,Int64)`. 9.00 and higher UnAssign the template from the folder.
- `UnlinkTaxonomy(Int64,Int64)`. 8.60 and higher Unlink the supplied folder from the supplied taxonomy. All content in the folder is automatically unassigned from the given taxonomy.
- *Update* on page 1257

Add

```
Add(Ektron.Cms.FolderData)
```

Adds a folder based on information in an FolderData object.

The method populates the `message.Id` with the newly created ID.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Parent Folder ID
- Style Sheet
- Description

Parameters

- `folderData`. The FolderData object to add.

Returns

Added FolderData object.

        }
    }
```

AllowTaxonomy

```
AllowTaxonomy(System.Int64,System.Collections.Generic.List)
```

Allows a list of taxonomy data based on IDs to a folder.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- * Taxonomy ID List (comma separated)

Parameters

- `folderId`. Folder ID to which taxonomies are permitted.
- `taxonomyIdList`. List of taxonomy IDs.

        }
    }
```

AssignMetadata

8.60 and higher

```
AssignMetadata(System.Int64,System.Int64,System.Boolean)
```

Assign a metadata to a folder.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- * Metadata Type ID

- Is Required

Parameters

- `folderId`. The ID of the folder.
- `metadataTypeId`. The ID of the metadata type.
- `isRequired`. Indicates whether metadata is required.

.aspx code snippet

```

Delete

```
Delete(System.Int64)
```

Deletes a folder from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `folderId`. The ID of the folder to delete.

Remarks

Validate the item using `GetItem()` before deleting.

GetAssignedTaxonomy

```
GetAssignedTaxonomy(System.Int64)
```

Retrieves a list of Taxonomy data that is assigned to a folder.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID

Parameters

- `folderId`. Folder ID for which to retrieve taxonomy data.

Returns

List of TaxonomyData.

GetItem

```
GetItem(Ektron.Cms.FolderData)
```

Retrieves the properties of a specific FolderData object.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Recursive

Parameters

- `folderId`. The ID of the folder to retrieve.
- `returnChildProperties`. Indicates whether child properties are returned.

```

GetList

```
GetList(Ektron.Cms.FolderCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Folder Property
- * Object Value

Parameters

- `criteria`. FolderCriteria used to retrieve folders.

Returns

List of retrieved FolderData items.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.MenuBaseData)
```

Updates an existing folder in the CMS.

Authenticated users

- CMS Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Folder ID
- Name

- Publish as PDF
- Style Sheet
- Description

Parameters

- `folderData`. The FolderData object to update.

Returns

Updated FolderData object.

Remarks

Validate the folder with `GetItem()` before you update the properties. Then, call `Update` with your modified FolderData object.

NOTE: You cannot change all properties after the initial Add event, such as the FolderData.Type.

Data Classes

FolderCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Constructors

- `FolderCriteria()`

  ```
  public FolderCriteria()
  ```

- `FolderCriteria(Ektron.Cms.Common.FolderProperty, EkEnumeration.OrderByDirection)`

  ```
  public FolderCriteria(Ektron.Cms.Common.FolderProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `FolderProperty` are:

  - Description
  - FolderName
  - FolderPath
  - FolderType
  - Id
  - IsCommunityFolder
  - IsDomainFolder
  - IsHidden
  - IsPrivate
  - ParentId

Properties

- `ReturnChildProperties`

  ```
  public bool ReturnChildProperties { set; get; }
  ```

FolderData

Namespace

```
Ektron.Cms
```

Properties

- `AliasRequired`

  ```
  public bool AliasRequired { set; get; }
  ```

- ApprovalMethod

```
public int ApprovalMethod { set; get; }
```

- CategoryRequired

```
public bool CategoryRequired { set; get; }
```

- ChildFolders

```
public Ektron.Cms.Controls.CmsWebService.FolderData[] ChildFolders { set; get; }
```

- Description

```
public string Description { set; get; }
```

- DomainProduction

```
public string DomainProduction { set; get; }
```

- DomainStaging

```
public string DomainStaging { set; get; }
```

- FlagInheritedFrom

```
public long FlagInheritedFrom { set; get; }
```

- FolderFlags

```
public Ektron.Cms.Controls.CmsWebService.FlagDefData[] FolderFlags { set; get; }
```

- FolderMetadata

```
public Ektron.Cms.Controls.CmsWebService.ContentMetaData[] FolderMetadata { set;
get; }
```

- FolderTemplates

```
public Ektron.Cms.Controls.CmsWebService.TemplateData[] FolderTemplates { set; get;
}
```

- FolderType

```
public int FolderType { set; get; }
```

- HasChildren

```
public bool HasChildren { set; get; }
```

- IsAliasInherited

```
public bool IsAliasInherited { set; get; }
```

- IsCommunityFolder

```
public bool IsCommunityFolder { set; get; }
```

- IsDomainFolder

```
public bool IsDomainFolder { set; get; }
```

- IsFlagInherited

```
public bool IsFlagInherited { set; get; }
```

- IsMetaInherited

```
public bool IsMetaInherited { set; get; }
```

- IsPermissionInherited

```
public bool IsPermissionsInherited { set; get; }
```

- IsSitemapInherited

```
public bool IsSitemapInherited { set; get; }
```

- IsStyleSheetInherited

```
public bool IsStyleSheetInherited { set; get; }
```

- IsTaxonomyInherited

```
public bool IsTaxonomyInherited { set; get; }
```

- IsTemplateInherited

```
public bool IsTemplateInherited { set; get; }
```

- IsXmlInherited

```
public bool IsXmlInherited { set; get; }
```

- Name

```
public string Name { set; get; }
```

- NameWithPath

```
public string NameWithPath { set; get; }
```

- ParentId

```
public long ParentId { set; get; }
```

- Permissions

```
public Ektron.Cms.Controls.CmsWebService.PermissionData Permissions { set; get; }
```

- PrivateContent

```
public bool PrivateContent { set; get; }
```

- PublishHtmlActive

```
public bool PublishHtmlActive { set; get; }
```

- PublishPdfActive

```
public bool PublishPdfActive { set; get; }
```

- PublishPdfEnabled

```
public bool PublishPdfEnabled { set; get; }
```

- ReplicationMethod

```
public int ReplicationMethod { set; get; }
```

- SitemapPath

```
public Ektron.Cms.Controls.CmsWebService.SitemapPath[] SitemapPath { set; get; }
```

- StyleSheet

```
public string StyleSheet { set; get; }
```

- TemplateFileName

```
public string TemplateFileName { set; get; }
```

- TemplateId

```
public long TemplateId { set; get; }
```

- TotalContent

```
public int TotalContent { set; get; }
```

- XmlConfiguration

```
public Ektron.Cms.Controls.CmsWebService.XmlConfigData[] XmlConfiguration { set; get; }
```

MenuManager

8.50 and higher

The MenuManager class manages drop down menus for your Web site.

Menu items can link to content, library assets, external hyperlinks, and submenus.

Namespace

```
Ektron.Cms.Framework.Organization.MenuManager
```

Constructors

- `MenuManager()`
- `MenuManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MenuManagerService`. Returns an instance of the business objects task manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- `GetMenuItemList(MenuItemCriteria)`. 9.00 and higher Returns a list of menu ites based upon the supplied MenuItemCriteria.
- `GetMenuList(MenuCriteria)`. 8.60 and higher Gets a list of MenuData, not menubase data, based upon the supplied MenuItemCriteria.
- *GetTree* on page 1278
- *Update (menu)* on page 1281
- *Update (menu item)* on page 1284
- *Update (submenu)* on page 1287

Add (menu)

```
Add(Ektron.Cms.MenuData)
```

Adds the specified MenuData object.

Authenticated users

- CMS Administrators
- Menu Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- Description

Parameters

- `menuData`. The MenuData.

Remarks

Validate the ID using `GetItem()` before adding a menu for Library or Content types item.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">

```

Update (menu)

```
Update(Ektron.Cms.Organization.MenuData)
```

Updates the specified MenuData in the CMS.

Authenticated users

- CMS Administrators
- Menu Administrators

- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Menu ID
- Title
- Description

Parameters

- `menuData`. The MenuData.

Remarks

Validate the menu item with `GetItem()` before you update the properties. Then, call `Update` with your modified MenuData object.

NOTE: You cannot change all properties after the initial Add event, such as the FolderData.Type.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update (menu item)

```
Update(Ektron.Cms.Organization.MenuItemData)
```

Updates an existing menu item in the CMS.

Authenticated users

- CMS Administrators
- Menu Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- *Content Menu Item ID
- Content Item ID
- Menu (Submenu) ID
- Description

Parameters

- `menuItemData`. The MenuItemData.

Remarks

Validate the menu item with `GetItem()` before you update the properties. Then, call `Update` with your modified MenuItemData object.

NOTE: You cannot change all properties after the initial Add event, such as the FolderData.Type.

Data Classes

MenuCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Organization
```

Properties

- `MenuCriteria()`

  ```
  public MenuCriteria()
  ```

- `MenuCriteria(Ektron.Cms.Organization.MenuProperty, EkEnumeration.OrderByDirection)`

  ```
  public MenuCriteria(Ektron.Cms.Organization.MenuProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `MenuProperty` are:

  - AssociatedFolders
  - AssociatedTemplates
  - Description
  - Href
  - Id
  - ImageOverride
  - LanguageId
  - Text
  - Type

MenuData

Namespace

```
Ektron.Cms.Common
```

Properties

- `AncestorId`

  ```
  Public AncestorID As Long
  ```

- `AssociatedFolders`

  ```
  Public AssociatedFolders As String
  ```

- `AssociatedTemplates`

  ```
  Public AssociatedTemplates As String
  ```

- `Clone() As Object`

  ```
  Public Function Clone() As Object Implements ICloneable.Clone
  ```

- `Description`

  ```
  Public Description As String
  ```

- FolderId

```
Public FolderID As Long
```

- HasChildren

```
Public HasChildren As Boolean
```

- ID

```
Public ID As Long
```

- Image

```
Public Image As String
```

- ImageOverride

```
Public ImageOverride As Boolean
```

- Item

```
Public Item() As Ektron.Cms.Common.MenuItemData
```

- Link

```
Public Link As String
```

- ParentID

```
Public ParentID As Long
```

- Template

```
Public Template As String
```

- Title

```
Public Title As String
```

- Type

```
Public Type As Ektron.Cms.Common.EkEnumeration.CMSMenuItemType
```

MenuItemCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Organization
```

Properties

- MenuItemCriteria()

```
public MenuItemCriteria()
```

- MenuItemCriteria(Ektron.Cms.Organization.MenuItemProperty, EkEnumeration.OrderByDirection)

```
public MenuItemCriteria(Ektron.Cms.Organization.MenuItemProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

  Accepted fields for the `MenuItemProperty` are:

  - ItemDescription
  - Itemid
  - ItemType

- LanguageId
- MenuId
- MenuItemId
- MenuName
- Title

MenuItemData

Namespace

```
Ektron.Cms.Common
```

Properties

- `Clone() As Object`

```
Public Function Clone() As Object Implements ICloneable.Clone
```

- `ItemContentSubType`

```
Public ItemContentSubType As Integer
```

- `ItemDescription`

```
Public ItemDescription As String
```

- `ItemID`

```
Public ItemID As Long
```

- `ItemImage`

```
Public ItemImage As String
```

- `ItemImageOverride`

```
Public ItemImageOverride As Boolean
```

```

- `ItemQuickLink`

```
Public ItemQuickLink As String
```

- `ItemSubType`

```
Public ItemSubType As Integer
```

- `ItemTarget`

```
Public ItemTarget As String
```

- `ItemTitle`

```
Public ItemTitle As String
```

- `ItemType`

```
Public ItemType As Ektron.Cms.Common.EkEnumeration.CMSMenuItemType
```

- `Menu`

```
Public Menu As Ektron.Cms.Common.MenuData
```

SubMenuData

Namespace

```
Ektron.Cms.Organization
```

Properties

- `ItemId`. Gets or sets the item id.

  ```
  public long ItemId { set; get; }
  ```

- `ParentId`. Gets or sets the ID of the parent menu. Root menus will have a parent ID of 0.

  ```
  public override long ParentId { set; get; }
  ```

- `SubMenuData()`. Initializes a new instance of the SubMenuData class.

  ```
  public SubMenuData()
  ```

- `SubMenuData(string)`. Initializes a new instance of the SubMenuData class.

  ```
  public SubMenuData(string text)
  ```

TaxonomyItemManager

8.50 and higher

The TaxonomyItemManager class manages taxonomy items. For information about taxonomies, see Organizing Content with Taxonomies in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Organization.TaxonomyItemManager
```

Constructors

- `TaxonomyItemManager()`
- `TaxonomyItemManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TaxonomyService`. TaxonomyService.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1297
- *GetList* on page 1300
- `Reorder(Int64,Int64,Int32,TaxonomyReorderItemType,Boolean)`. 8.60 and higher Reorders the taxonomy items.
- *Update* on page 1303

Add

```
Add(Ektron.Cms.TaxonomyItemData)
```

Adds a taxonomy item from TaxonomyItemData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Taxonomy ID
- * Item Type
- * Item ID

Parameters

- `taxonomyData`. The TaxonomyItemData object to add.

Returns

Returns the custom CmsData object added.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a taxonomy item from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Taxonomy ID
- * Taxonomy Item ID
- * Item Type

Parameters

- `taxonomyId`. The taxonomy ID of the item to be deleted.
- `taxonomyItemId`. The taxonomy item ID to be deleted.
- `type`. The item taxonomy type to be deleted.

Remarks

Validate the item with `GetItem()` before deleting it.

GetList

```
GetList(TaxonomyItemCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Taxonomy Item Property
- * Object Value

Parameters

- `criteria`. The TaxonomyItemCriteria to filter taxonomy items on.

Returns

List with the retrieved TaxonomyItemData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

    }
```

Update

```
Update(Ektron.Cms.FolderData)
```

Updates an existing TaxonomyItemData in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Taxonomy ID
- * Item Type
- * Item ID

Parameters

- `taxonomyData`. The TaxonomyItemData object to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the Taxonomy Item item with `GetItem()` before you update the properties. Then, call `Update` with your modified TaxonomyItemData object.

NOTE: You cannot change all properties after the initial Add event, such as the TaxonomyItemData.Type.

Data Classes

TaxonomyItemCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Organization
```

Properties

- `ReturnRecursiveChildren`. Gets or sets the `ReturnRecursiveChildren` flag. If true AND a `ParentId` filter is supplied, all recursive children taxonomies will be returned for the parent ID.

  ```
  public bool ReturnRecursiveChildren { set; get; }
  ```

- `TaxonomyItemCriteria()`

  ```
  public TaxonomyItemCriteria()
  ```

- `TaxonomyItemCriteria (Ektron.Cms.Organization.TaxonomyItemProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaxonomyItemCriteria(Ektron.Cms.Organization.TaxonomyItemProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaxonomyItemProperty` are:

  - AssignedByUserId
  - DateCreated

- DateModified
- ItemId
- ItemType
- LanguageId
- TaxonomyId
- TaxonomyItemDisplayOrder
- TaxonomyLanguageId
- TaxonomyName
- TaxonomyPath
- TaxonomyType
- Title

TaxonomyManager

8.50 and higher

The TaxonomyManager class manages taxonomies. For information about taxonomies, see Organizing Content with Taxonomies in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Organization.TaxonomyManager
```

Constructors

- `TaxonomyManager()`
- `TaxonomyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TaxonomyService`. Taxonomy Service
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the facing page
- *Delete* on page 1313
- *GetItem (taxonomy ID)* on page 1315
- *GetItem (taxonomy path)* on page 1317
- *GetList* on page 1319
- `GetList(TaxonomyCustomPropertyCriteria)`. 8.60 and higher Returns a list of all taxonomies based upon custom property criteria supplied.
- *GetTaxonomyConfigurationList* on page 1321

- `GetTree(Int64,Int32,Boolean,PagingInfo,TaxonomyType,TaxonomyItemsSortOrder)`. Returns a taxonomy tree based on taxonomy ID.
- `GetTree(String,Int32,Boolean,PagingInfo,TaxonomyType,TaxonomyItemsSortOrder)`. Returns a taxonomy tree based on taxonomy path.
- `ImportTaxonomy(String,String)`. 8.60 and higher Creates a taxonomy using XML file.
- `MoveTaxonomy(Int64,Int64)`. 8.60 and higher Moves the taxonomy with items from one to another at any level.
- `Reorder(Int64,Int32,Boolean)`. 8.60 and higher Reorders the taxonomy category based on taxonomy ID.
- *Update* on page 1323
- *UpdateTaxonomyConfigurations* on page 1326

Add

```
Add(Ektron.Cms.TaxonomyData)
```

Adds a taxonomy from TaxonomyData object.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Parent ID
- Taxonomy Type
- Description

Parameters

- `taxonomyData`. The TaxonomyData to add.

Returns

Returns the custom CmsData object added.

        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a taxonomy from the CMS.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `taxonomyId`

Remarks

Validate the item with `GetItem()` before deleting it.

        }
    }
```

GetItem (taxonomy ID)

```
GetItem(System.Int64)
```

Retrieves a taxonomy node-based on taxonomy ID. To retrieve child items, use `GetTree()`.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of taxonomy node to return.

Returns

TaxonomyData object.

    }
```

GetTaxonomyConfigurationList

```
GetTaxonomyConfigurationList(System.Int64)
```

Retrieves a list of taxonomy configurations for a taxonomy. Taxonomy configurations determine the type of CMS objects that you can assign to a taxonomy.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `taxonomyId`. ID of taxonomy to retrieve configurations for.

Returns

List of taxonomy configuration enumerations.

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
}
```

Update

```
Update(Ektron.Cms.TaxonomyData)
```

Update is used to update an existing TaxonomyData object in the CMS.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Name
- Parent ID
- * Taxonomy Type
- Description

Parameters

- `taxonomyData`

Returns

Returns the custom CmsData object updated.

Remarks

Validate the Taxonomy item with `GetItem()` before you update the properties. Then, call `Update` with your modified TaxonomyData object.

NOTE: You cannot change all properties after the initial Add event, such as the TaxonomyData.Type.

    }
```

UpdateTaxonomyConfigurations

```
UpdateTaxonomyConfigurations(System.Int64,System.Collections.Generic.List)
```

Updates a configuration list for a taxonomy.

Authenticated users

- CMS Administrators
- Taxonomy Administrators
- Users that have access permission

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Taxonomy Configuration

Parameters

- `taxonomyId`. Taxonomy ID that is updated.
- `configurationList`. List of taxonomy configurations to apply for update.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">

```

Data Classes

TaxonomyCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Organization
```

Properties

- `ReturnRecursiveChildren`. Gets or sets the `ReturnRecursiveChildren` flag. If true AND a `ParentId` filter is supplied, all recursive children taxonomies will be returned for the parent ID.

  ```
  public bool ReturnRecursiveChildren { set; get; }
  ```

- `TaxonomyCriteria()`

  ```
  public TaxonomyCriteria()
  ```

- `TaxonomyCriteria(Ektron.Cms.Organization.TaxonomyProperty, EkEnumeration.OrderByDirection)`

```
public TaxonomyCriteria(Ektron.Cms.Organization.TaxonomyProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `TaxonomyProperty` are:

- DateCreated
- HasChildren
- Id
- ItemCount
- LanguageId
- Level
- Name
- ParendId
- Path
- TaxonomyDisplayOrder
- TemplateId
- Type

TaxonomyData

Namespace

```
Ektron.Cms
```

Properties

- `FolderId`

  ```
  public long FolderId { set; get; }
  ```

- `Taxonomy`

  ```
  public Ektron.Cms.Controls.CmsWebService.TaxonomyData[]
    Taxonomy { set; get; }
  ```

- `TaxonomyConfigurations`

  ```
  public Ektron.Cms.Controls.CmsWebService.TaxonomyConfiguration[]
    TaxonomyConfigurations { set; get; }
  ```

- `TaxonomyItems`

  ```
  public Ektron.Cms.Controls.CmsWebService.TaxonomyItemData[]
    TaxonomyItems { set; get; }
  ```

Search

The Search manager category manages online searches and has the following classes:

- *SearchManager* on the facing page. Provides access to query the index of a configured search provider.
- *QueryPropositionManager* on page 1341. 9.00 and higher Provides access to query the index of a configured search provider.
- *Search Data Classes* on page 1346
- *Search Exceptions* on page 1384
- *Search Expressions* on page 1389
- *Search Abstract Classes and Interfaces* on page 1412

SearchManager

The SearchManager provides access to query the index of a configured search provider.

Namespace

```
Ektron.Cms.Framework.Search.SearchManager
```

Constructors

- `SearchManager()`
- `SearchManager(ApiAccessMode)`

Properties

- `SearchService`. Gets the underlying service facilitating access to the configured search provider.

Methods

- *Search(AdvancedSearchCriteria)* on the next page
- *Search(KeywordSearchCriteria)* on page 1336

Remarks

- `All Providers`. For diagnostic purposes, the search provider's interpretation of your search criteria can be logged to the Windows Application log. This represents the raw query issued to the search engine. To log this information, set the value of the `LogLevel` application setting in your site's `web.config` to `3`.
- `FAST Search for Sharepoint 2010`. The AdvancedSearchCriteria is not applicable when your search provider is Microsoft FAST Search for SharePoint. For the purposes of easing migration to this provider, any queries using this criteria is interpreted as KeywordSearchCriteria.
- `Search Server 2010`. MSDN states that the maximum length for a keyword query is 2048 characters. If you encounter this limitation using the KeywordSearchCriteria, consider revising your query or switching to the AdvancedSearchCriteria which supports longer queries.

  MSDN also states that the maximum length for a full-text search query is 4096 characters. If you encounter this limitation using the AdvancedSearchCriteria, consider revising your query.
- `Solr`. The AdvancedSearchCriteria is not applicable when your search provider is Apache Solr. For the purposes of easing migration to this provider, any queries using this criteria is interpretedas KeywordSearchCriteria.

  By default, the content of assets (Word documents, PDFs, and so on) is indexed for files up to 10 MB in size. This limit is intended to accelerate crawl times and

minimize the burden placed upon the search server by the content extraction process. When a file exceeds this limit, its summary is indexed instead of the full content of the document. The limit can be adjusted via the ManifoldCF administration console. (Use caution when updating advanced configuration options such as this. Changes may impact the performance of your search server.)

Solr relies on Apache Tika, an open source collection of content analysis libraries, for the extraction of content from asset files (Word documents, PDFs, and so on). Support for the extraction of content from these types of files is subject to the features and limitations of this toolkit.

Search(AdvancedSearchCriteria)

```
Search(Ektron.Cms.Search.KeywordSearchCriteria)
```

Issues advanced search to return specific results and run complex queries.

Submits a query according to the specified criteria. The AdvancedSearchCriteria is intended to target specific, narrow, sets of data. The length and complexity of queries supported by this method are subject to the limitations of the configured search provider. For some search providers, this method may also allow for longer or more complicated queries than may be allowed with the KeywordSearchCriteria. This method is not supported for all search providers.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Parameters

- `criteria`. Search criteria.

Returns

Search response data.

Return properties

You want the following properties to be returned when viewing the results.

```
criteria.ReturnProperties = new HashSet<PropertyExpression>()
{
  SearchContentProperty.Id,
  SearchContentProperty.Title,
  SearchContentProperty.QuickLink
};
```

OrderBy

Sets the order of search results based on a return property `Ascending/Descending`.

```
criteria.OrderBy = new List<OrderData>()
{
```

```
  new OrderData(SearchContentProperty.Rank, OrderDirection.Descending)
};
```

PagingInfo

Sets the number of results you see per page and the current page number for search.

```
criteria.PagingInfo = new PagingInfo(10);
criteria.PagingInfo.CurrentPage = 1;
```

ExpressionTree

Helps build nested or complex queries using managed properties. This examples shows how to search for the Content ID specified by the user in the currently active site language or default content language (if no active language is found). Also, search results are restricted by Content Type (`Ektron.Cms.Search.SearchType.IsNonUserContent()`) to ensure users or community groups do not appear.

```
ContentManager contentManager = new ContentManager();
Expression expressionTree = Ektron.Cms.Search.SearchType.IsNonUserContent();
if (contentManager.RequestInformation.ContentLanguage == 0)
  expressionTree &= SearchContentProperty.Language.EqualTo
(contentManager.RequestInformation.DefaultContentLanguage);
else if (contentManager.RequestInformation.ContentLanguage > 0)
  expressionTree &= SearchContentProperty.Language.EqualTo
(contentManager.RequestInformation.ContentLanguage);
  expressionTree &= SearchContentProperty.Id.EqualTo(id);
  criteria.ExpressionTree = expressionTree;
```

        }
    }
```

Search(KeywordSearchCriteria)

```
Search(Ektron.Cms.Search.KeywordSearchCriteria)
```

Issues a simple text search query that you can combine with complex managed property queries.

Submits a query according to the specified criteria. The criteria may be a combination of free form search terms and programmatically generated query expressions. The length and complexity of queries supported by this method are subject to the limitations of the configured search provider.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Parameters

- `criteria`. Search criteria.

Returns

Search response data.

ReturnProperties

Returns the properties you want in the results.

```
criteria.ReturnProperties = new HashSet<PropertyExpression>()
{
  SearchContentProperty.Id,
  SearchContentProperty.Title,
  SearchContentProperty.QuickLink
};
```

OrderBy

Sets the order of search results based on a return property `Ascending/Descending`.

```
criteria.OrderBy = new List<OrderData>()
{
new OrderData(SearchContentProperty.Rank, OrderDirection.Descending)
};
```

PagingInfo

Sets the number of results you see per page and the current page number for search.

```
criteria.PagingInfo = new PagingInfo(10);
criteria.PagingInfo.CurrentPage = 1;
```

QueryText

Set the text search query.

```
criteria.QueryText = uxSearchText.Text;
```

ExpressionTree

Helps build nested or complex queries using managed properties. The following example shows how to search for the content in the currently active Site language or default content language (if no active language is found). Also, the search results are restricted by Content Type (`Ektron.Cms.Search.SearchType.IsNonUserContent()`) to ensure users or community groups do not appear.

```
ContentManager contentManager = new ContentManager();
Expression expressionTree = Ektron.Cms.Search.SearchType.IsNonUserContent();
if (contentManager.RequestInformation.ContentLanguage == 0)
  expressionTree &= SearchContentProperty.Language.EqualTo
(contentManager.RequestInformation.DefaultContentLanguage);
else if (contentManager.RequestInformation.ContentLanguage > 0)
  expressionTree &= SearchContentProperty.Language.EqualTo
(contentManager.RequestInformation.ContentLanguage);
```

QueryPropositionManager

9.00 and higher

The QueryPropositionManager provides access to query the index of a configured search provider.

Namespace

```
Ektron.Cms.Framework.Search.QueryPropositionManager
```

Constructors

- `QueryPropositionManager()`
- `QueryPropositionManager(ApiAccessMode)`

Properties

- `QueryPropositionService`. Gets the underlying query proposition service supporting the configured search provider.

Methods

- *GetQueryCompletions* below
- `GetQueryCompletions(String,Int32,QueryCompletionSortOrder)`. Gets query completions as directed by the specified query completion request parameters.
- `GetQueryCompletions(QueryCompletionRequest)`. Gets query completions as directed by the specified query completion request parameters.
- *GetQuerySuggestions* on page 1344
- `GetQuerySuggestions(QuerySuggestionRequest)`. Return Query suggestions based on request parameters.

GetQueryCompletions

```
GetQueryCompletions(System.String,System.Int32)
```

Return query suggestions based on request parameters.

Parameters

- `searchText`. Search term
- `maxCount`. Suggested maximum count of query completions for the search engine. Actual counts may vary according to term availability as determined by the search engines internal algorithms.

Returns

Query completions.

GetQuerySuggestions

```
GetQuerySuggestions(System.String,System.Int32)
```

Return Query suggestions based on request parameters.

Parameters

- `searchText`. Query text.
- `maxCount`. Maximum number of query completions requested.

Returns

Query suggestions.

Remarks

- `All Providers`. The terms returned for any request are subject to the internal algorithms of the configured search provider, the quality of the content in the index, and the configuration of any supporting dictionaries.

  The maximum count parameter is a suggestion for the search engine. Actual counts may vary according to term availability, as determined by the search engine's internal algorithms.

        }
    }
```

Search Data Classes

8.60 and higher

AdministratorPermission

The AdministratorPermission class serves as a token identifying that a search query is intended to be executed as an administrator user.

Namespace

```
Ektron.Cms.Search.AdministratorPermission
```

Methods

- `Authenticate(IAuthenticationHandler)`. Authenticates the current permission against the given authentication handler

AdvancedSearchCriteria

8.50 and higher

The AdvancedSearchCriteria class describes a narrow search query primarily defined by a logical expression tree. This criteria is intended narrower, targeted, querying.

Namespace

```
Ektron.Cms.Search.AdvancedSearchCriteria
```

Properties

- `EnableStemming`. Gets or sets a flag indicating whether or not stemming is enabled for the query.
- `ExpressionTree`. Gets and sets the logical expression tree for filtering results.
- `IncludeSuggestedResults`. Gets and sets a flag indicating whether to retrieve suggested results in addition to the relevant search results.
- `Locale`. Gets and sets the query engine's target locale.
- `OrderBy`. Gets and sets the list of result ordering rules.
- `PagingInfo`. Gets and sets the paging information.
- `Permission`. Gets and sets the permissions with which to search.
- `Refinement`. Gets or sets the criteria used to indicate how refinements should be applied to the query.

  NOTE: Query refinement is not supported by all search providers and may require some additional manual configuration.

- `ReturnProperties`. Gets and sets the list of columns to return in the results.
- `Scope`. Gets and sets the scope information.
- `Similarity`. Gets or sets the criteria used to refine the query to items that are most similar to a particular item. Note: Similarity search functionality is not supported by all search providers.

Constructors

- `AdvancedSearchCriteria()`. Constructor.

Remarks

- `All Providers`. The `Locale` property should be used to specify what type of language processing is applied to your query. The current site language is used as a default if the `Locale` is not explicitly specified.
- `FAST Search for Sharepoint 2010`. The `AdvancedSearchCriteria` is not applicable when your search provider is Microsoft FAST Search for SharePoint. For the purposes of easing migration to this provider, any queries using this criteria is interpreted as `KeywordSearchCriteria`. See also `KeywordSearchCriteria` for additional information.
- `Search Server 2010`. The `Refinement` property is not supported if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.

  The `Similarity` property is not supported if your search provider is Microsoft Search Server 2010. Similarity search functionality is not available.

- `Solr`. The `AdvancedSearchCriteria` is not applicable when your search provider is Apache Solr. For the purposes of easing migration to this provider, any queries using this criteria are interpreted as `KeywordSearchCriteria`. See also the `KeywordSearchCriteria` for additional information.

8.60 and higher

BoundedFacetBucket

The BoundedFacetBucket class is a data structure describing a facet result that represent a range of values.

Namespace

```
Ektron.Cms.Search.BoundedFacetBucket<T>
```

Properties

- `Count`. Gets or sets the count of items encompassed by this bucket.
- `Refinement`. Gets or sets the refinement data identifying this facet. This data can be applied to subsequent queries to indicate that the result set should be restricted to items classified by this FacetBucket.
- `Value`. Gets or sets the upper and lower bounds for data encompassed by this facet bucket.

Constructors

- `BoundedFacetBucket(BoundedValue<T>,Int64)`. Constructor.

8.60 and higher

BoundedValue

The BoundedValue class is a data structure representing a range of refinement values.

Namespace

```
Ektron.Cms.Search.BoundedValue<U>
```

Properties

- `LowerBound`. Gets or sets the lower bound of the value range.
- `UpperBound`. Gets or sets the upper bound of the value range.

Constructors

- `BoundedValue(U)`. Constructor.
- `BoundedValue(U,U)`. Constructor.

CurrentUserPermission

8.50 and higher

The CurrentUserPermission class serves as a token identifying that a search query is intended to be executed as the user that has triggered the action to issue it.

Namespace

```
Ektron.Cms.Search.CurrentUserPermission
```

Methods

- `Authenticate(IAuthenticationHandler)`. Authenticates the current permission against the given authentication handler.

DateFacet

8.60 and higher

The DateFacet class represents a classification of search results on a date/time index field.

Namespace

```
Ektron.Cms.Search.DateFacet
```

Properties

- `Buckets`. Gets or sets the bounded facet buckets representing the DateTime ranges for this facet.
- `Property`. Gets or sets the property associated with this facet.

Constructors

- `DateFacet(DatePropertyExpression)`. Constructor.
- `DateFacet (DatePropertyExpression,ICollection<BoundedFacetBucket<DateTime>>)`. Constructor.
- `DateFacet(DateMultiValuePropertyExpression)`. Constructor.
- `DateFacet (DateMultiValuePropertyExpression,ICollection<BoundedFacetBucket<DateTime>>)`. Constructor.
- `DateFacet(PropertyExpression)`. Constructor.
- `DateFacet (PropertyExpression,ICollection<BoundedFacetBucket<DateTime>>)`. Constructor.

DateRefinementSpecification

8.60 and higher

The DateRefinementSpecification represents a strongly typed refinement specification for date/time index properties.

Namespace

```
Ektron.Cms.Search.DateRefinementSpecification
```

Properties

- `Property`. Gets or sets the refinement property.

Constructors

- `DateRefinementSpecification()`. Constructor.
- `DateRefinementSpecification(DateMultiValuePropertyExpression)`. Constructor.
- `DateRefinementSpecification (DateMultiValuePropertyExpression,ICollection<BoundedValue<DateTime>>)`. Constructor.
- `DateRefinementSpecification(DatePropertyExpression)`. Constructor.
- `DateRefinementSpecification (DatePropertyExpression,ICollection<BoundedValue<DateTime>>)`. Constructor.

Remarks

- `All Providers`. Add a `DateRefinementSpecification` to search criteria to identify a field for which facet data should be returned with the query results.
- `FAST Search for Sharepoint 2010`. Specifying explicit bounds for date refinements is not supported when your search provider is Microsoft FAST Search for SharePoint 2010. The date ranges are auto-generated by the search engine.
- `Search Server 2010`. The `DateRefinementSpecification` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.
- `Solr`. When explicit bounds for date refinements are not specified each unique date value will represent an individual facet bucket in your response.

DecimalFacet

8.60 and higher

The DecimalFacet class represents a classification of search results on a decimal index field.

Namespace

```
Ektron.Cms.Search.DecimalFacet
```

Properties

- `Buckets`. Gets or sets the collection of facet buckets associated with this facet.
- `Property`. Gets or sets the property associated with this facet.

Constructors

- `DecimalFacet(DecimalMultiValuePropertyExpression)`. Constructor.
- `DecimalFacet (DecimalMultiValuePropertyExpression,ICollection<BoundedFacetBucket<Double>>)`. Constructor.
- `DecimalFacet(DecimalPropertyExpression)`. Constructor.
- `DecimalFacet (DecimalPropertyExpression,ICollection<BoundedFacetBucket<Double>>)`. Constructor.
- `DecimalFacet(PropertyExpression)`. Constructor.
- `DecimalFacet (PropertyExpression,ICollection<BoundedFacetBucket<Double>>)`. Constructor.

8.60 and higher

DecimalRefinementSpecification

The DecimalRefinementSpecification represents a strongly typed refinement specification for decimal index properties.

Namespace

```
Ektron.Cms.Search.DecimalRefinementSpecification
```

Properties

- `Property`. Gets or sets the refinement property.

Constructors

- `DecimalRefinementSpecification()`. Constructor.
- `DecimalRefinementSpecification (DecimalMultiValuePropertyExpression)`. Constructor.
- `DecimalRefinementSpecification (DecimalMultiValuePropertyExpression,ICollection<BoundedValue<Double>>)`. Constructor.
- `DecimalRefinementSpecification(DecimalPropertyExpression)`. Constructor.

- `DecimalRefinementSpecification (DecimalPropertyExpression,ICollection<BoundedValue<Double>>)`. Constructor.

Remarks

- `All Providers`. Add a `DecimalRefinementSpecification` to search criteria to identify a field for which facet data should be returned with the query results.
- `FAST Search for Sharepoint 2010`. Specifying explicit bounds for decimal refinements is not supported when your search provider is Microsoft FAST Search for SharePoint 2010. The decimal ranges are auto-generated by the search engine.
- `Search Server 2010`. The `DecimalRefinementSpecification` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.
- `Solr`. When explicit bounds for decimal refinements are not specified each unique decimal value will represent an individual facet bucket in your response.

Facet

8.60 and higher

The Facet class represents a classification of search results on a specific index field.

Namespace

```
Ektron.Cms.Search.Facet<T>
```

Properties

- `Property`. Gets or sets the property associated with this facet.

Constructors

- `Facet(T)`. Constructor.

FacetBucket

8.60 and higher

The FacetBucket class describes a subset of results classified within a given facet.

Namespace

```
Ektron.Cms.Search.FacetBucket
```

Properties

- `Count`. Gets or sets the count of items encompassed by this bucket.
- `Refinement`. Gets or sets the refinement data identifying this facet. This data can be applied to subsequent queries to indicate that the result set should be restricted to items classified by this FacetBucket.

Constructors

- `FacetBucket(Int64)`. Constructor.

Facets

8.60 and higher

The Facets class is a data structure encapsulating a collection of facet data for an individual search response.

Namespace

```
Ektron.Cms.Search.Facets
```

Properties

- `Item[DateMultiValuePropertyExpression]`. Gets a DateFacet associated with the specified property.
- `Item[DatePropertyExpression]`. Gets a DateFacet associated with the specified property.
- `Item[DecimalMultiValuePropertyExpression]`. Gets a DecimalFacet associated with the specified property.
- `Item[DecimalPropertyExpression]`. Gets a DecimalFacet associated with the specified property.
- `Item[IntegerMultiValuePropertyExpression]`. Gets a IntegerFacet associated with the specified property.
- `Item[IntegerPropertyExpression]`. Gets a IntegerFacet associated with the specified property.
- `Item[PropertyExpression]`. Gets a Facet associated with the specified property.
- `Item[String]`. Gets a Facet with the specified property name.
- `Item[StringMultiValuePropertyExpression]`. Gets a StringFacet associated with the specified property.
- `Item[StringPropertyExpression]`. Gets a StringFacet associated with the specified property.

Constructors

- `Facets()`. Constructor.
- `Facets(ICollection<Facet<PropertyExpression>>)`. Constructor.

Methods

- `HasFacet(PropertyExpression)`. Returns true if this instance contains a facet for the property represented by the specified PropertyExpression.
- `HasFacet(String)`. Returns true if this instance contains a facet for the property represented by the specified property name.

IntegerFacet

8.60 and higher

The IntegerFacet class represents a classification of search results on a integer index field.

Namespace

```
Ektron.Cms.Search.IntegerFacet
```

Properties

- `Buckets`. Gets or sets the collection of facet buckets associated with this facet.
- `Property`. Gets or sets the property associated with this facet.

Constructors

- `IntegerFacet(IntegerMultiValuePropertyExpression)`. Constructor.
- `IntegerFacet (IntegerMultiValuePropertyExpression,ICollection<BoundedFacetBucket<Int64>>)`. Constructor.
- `IntegerFacet(IntegerPropertyExpression)`. Constructor.
- `IntegerFacet (IntegerPropertyExpression,ICollection<BoundedFacetBucket<Int64>>)`. Constructor.
- `IntegerFacet(PropertyExpression)`. Constructor.
- `IntegerFacet (PropertyExpression,ICollection<BoundedFacetBucket<Int64>>)`. Constructor.

IntegerRefinementSpecification

8.60 and higher

The IntegerRefinementSpecification represents a strongly typed refinement specification for integer index properties.

Namespace

```
Ektron.Cms.Search.IntegerRefinementSpecification
```

Properties

- `Property`. Gets or sets the refinement property.

Constructors

- `IntegerRefinementSpecification()`. Constructor.
- `IntegerRefinementSpecification (IntegerMultiValuePropertyExpression)`. Constructor.
- `IntegerRefinementSpecification (IntegerMultiValuePropertyExpression,ICollection<BoundedValue<Int64>>)`. Constructor.
- `IntegerRefinementSpecification(IntegerPropertyExpression)`. Constructor.
- `IntegerRefinementSpecification (IntegerPropertyExpression,ICollection<BoundedValue<Int64>>)`. Constructor.

Remarks

- `All Providers`. Add a `IntegerRefinementSpecification` to search criteria to identify a field for which facet data should be returned with the query results.
- `FAST Search for Sharepoint 2010`. Specifying explicit bounds for integer refinements is not supported when your search provider is Microsoft FAST Search for SharePoint 2010. The integer ranges are auto-generated by the search engine.
- `Search Server 2010`. The `IntegerRefinementSpecification` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.
- `Solr`. When explicit bounds for integer refinements are not specified each unique integer value will represent an individual facet bucket in your response.

8.50 and higher

KeywordSearchCriteria

The KeywordSearchCriteria class describes a free-text, keyword-centric search query. The criteria is intended for broad, traditional search queries.

Namespace

```
Ektron.Cms.Search.KeywordSearchCriteria
```

Properties

- `EnableStemming`. Gets or sets a flag indicating whether or not stemming is enabled for the query.
- `ExpressionTree`. Gets and sets the logical expression tree for filtering results.
- `ImplicitAnd`. Gets or sets a flag indicating whether or not an 'AND' operator is implied between search terms that lack any other explicit logical operator.
- `IncludeSuggestedResults`. Gets and sets a flag indicating whether or not to retrieve suggested results in addition to the relevant search results.
- `Locale`. Gets and sets the query engine's target locale.
- `OrderBy`. Gets and sets the list of result ordering rules.
- `PagingInfo`. Gets and sets the paging information.
- `Permission`. Gets and sets the permissions with which to search.
- `QueryText`. Gets and sets the keyword query text with which to filter the search results.
- `Refinement`. Gets or sets the criteria used to indicate how refinements should be applied to the query.

  NOTE: Query refinement is not supported by all search providers and may require some additional manual configuration.

- `ReturnProperties`. Gets and sets the list of columns to return in the results.
- `Scope`. Gets and sets the scope information.
- `Similarity`. Gets or sets the criteria used to refine the query to items that are most similar to a particular item. Note: Similarity search functionality is not supported by all search providers.

Constructors

- `KeywordSearchCriteria()`. Constructor.

Remarks

- `All Providers`. As a best practice, explicit property names should not be hard-coded in the value of the `QueryText` property. The PropertyExpression class (and its various derived classes) exist to abstract away the resolution of property names. This serves to decouple your query from the underlying index schema as well as maximize portability and version compatibility.

  The `Locale` property should be used to specify what type of language processing is applied to your query. The current site language is used as a default if the Locale is not explicitly specified.

- `FAST Search for Sharepoint 2010`. The Permission property is not supported if your search provider is Microsoft FAST Search for SharePoint 2010. Security trimming of documents at query time is not available.
- `Search Server 2010`. The `Refinement` property is not supported if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.

  The `Similarity` property is not supported if your search provider is Microsoft Search Server 2010. Similarity search functionality is not available.
- `Solr`. With Apache Solr, the `EnableStemming` option is not available. In Solr, stemming is not a feature that can be toggled at query-time. It is configured on a field by field basis in the `schema.xml` for a given Solr core. By default, stemming is only applied to the content body and content title. There is no stemming applied to any of the other index fields. If a different behavior is required, you should consider customizing the index schema for your site.

  The `Permission` property is not supported if your search provider is Apache Solr. Security trimming of documents at query time is not available.

  The `Similarity` property is not supported if your search provider is Apache Solr. Similarity search functionality is not available.

  The `Scope` property is not supported if your search provider is Apache Solr.

  Ranking algorithms will use the contents of the `QueryText` property when determining the relevancy of a particular result item. The `ExpressionTree` will filter your results but will not influence their rank.

  While Solr utilizes boolean operators and related terminology, it is important to consider that these expressions are actually interpreted by Solr as set operations. The 'AND' expression can be thought of as a conjunction operation and 'OR' can be thought of as an injunction operation. If your query produces an unexpected result set, try to revise your query with this in mind. (For additional details on this behavior, see the following article: Why Not AND, OR, And NOT?)
