  By default, the content of assets (Word documents, PDFs, and so on) is indexed for files up to 10 MB in size. This limit is intended to accelerate crawl times and minimize the burden placed upon the search server by the content extraction process. When a file exceeds this limit, its summary is indexed instead of the full content of the document. The limit can be adjusted via the ManifoldCF administration console. (Use caution when updating advanced configuration options such as this. Changes may impact the performance of your search server.)

  Solr relies on Apache Tika, an open source collection of content analysis libraries, for the extraction of content from asset files (Word documents, PDFs, and so on). Support for the extraction of content from these types of files is subject to the features and limitations of this toolkit.

Locale

8.50 and higher

The Locale class provides a mapping of language IDs to the relevant locale for a search query.

Namespace

```
Ektron.Cms.Search.Locale
```

Properties

- `Code`. Gets the identifying code for this locale.
- `Default`. Gets the default 'Locale' according to the current content language.
- `ID`. Gets the language ID for this locale.

Methods

- `Create(Int32)`. Gets the string locale code represented by the language ID.
- `Get(Int32)`. Gets the locale code for the specified language ID.

ManualUserPermission

8.50 and higher

The ManualUserPermission class is a data structure encapsulating permission data representing a specific, manually specified, CMS user.

Namespace

```
Ektron.Cms.Search.ManualUserPermission
```

Properties

- `UserId`. Gets and sets the user identification to apply to search results

Constructors

- `ManualUserPermission(Int64)`. Constructor.

Methods

- `Authenticate(IAuthenticationHandler)`. Authenticates the current permission against the given authentication handler.

OrderData

8.50 and higher

The OrderData class represents the ordering information for the result set of a search query.

Namespace

```
Ektron.Cms.Search.OrderData
```

Properties

- `Direction`. Gets or sets the direction in which to sort a result set.
- `Property`. Gets or sets the property on which to sort a result set.

Constructors

- `OrderData(PropertyExpression,OrderDirection)`. Constructor.

Remarks

- `All Providers`. Your search provider may require that you explicitly configure an index field as sortable. If you find that your results are not sorting as directed, consult the search provider vendor's documentation for information regarding how you would configure this functionality.

  Many search providers will apply an ASCII-based sort to textual fields. Keep this in mind when sorting on string properties.

  The `HighlightedSummary` property cannot be sorted.

  The `Rank` property cannot be sorted in an ascending direction.

- `Solr`. Sorting of results is not supported for multi-value fields.

  Sorting of results is not supported for text fields with tokenization or other text processing applied to them. If you are sorting on a custom field, it is recommended that you also create an exact-match companion field containing an unprocessed copy of the data. See your `schema.xml` file for additional information on creating these fields.

  Smart Form fields cannot be sorted on. Apache Solr does not support the sorting of multi-value fields. If sorting behavior is required for data associated with Smart Form content, please consider using a companion metadata definition.

Permission

8.50 and higher

The Permission class is an abstract base class describing CMS permission data that can be applied to a search query.

Namespace

```
Ektron.Cms.Search.Permission
```

Methods

- `Authenticate(IAuthenticationHandler)`. Authenticates the current permission against the given authentication handler.
- `CreateAdministratorPermission()`. Creates a new permission instance representing a CMS administrator.
- `CreateCurrentUserPermission()`. Creates a new Permission instance representing the current CMS user.
- `CreateManualUserPermission(Int64)`. Creates a new Permission instance representing the specified CMS user.

9.00 and higher

QueryCompletionRequest

The QueryCompletionRequest class defines the parameters of a request for the configured search engine to predict query terms based on some partial term input.

Namespace

```
Ektron.Cms.Search.QueryCompletionRequest
```

Properties

- `DictionaryName`. Gets or sets the name of the target dictionary supplying completed terms. This parameter is not supported by all search providers. See the Ektron Developer Reference for guidance.
- `HandlerName`. Gets or sets the name of the handler supplying completed terms. This parameter is not supported by all search providers. See the Ektron Developer Reference for guidance.
- `Language`. Gets or sets the target content language for content feeding potential completed terms.
- `MaxCount`. Gets or sets the suggested maximum count of query completions for the search engine. Actual counts may vary according to term availability as determined by the search engine's internal algorithms.
- `Query`. Gets or sets the (partial) query term which the search engine will use as a seed for predicting completed terms.
- `SortOrder`. Gets or sets the type of sorting applied to query completion results.

Constructors

- `QueryCompletionRequest()`. Constructor.
- `QueryCompletionRequest(String,Int32)`. Constructor.

- `QueryCompletionRequest (String,Int32,Int32,QueryCompletionSortOrder)`. Constructor.
- `QueryCompletionRequest(String,Int32,QueryCompletionSortOrder)`. Constructor.

Remarks

- `All Providers`. The maximum count parameter is a suggestion for the search engine. Actual counts may vary according to term availability, as determined by the search engine's internal algorithms.
- `FAST Search for Sharepoint 2010`. The `Language` property is not supported if your search provider is Microsoft FAST Search for SharePoint 2010.

  The `HandlerName` property is not supported if your search provider is Microsoft FAST Search for SharePoint 2010.

  The `DictionaryName` property is not supported if your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. The `Language` property is not supported if your search provider is Microsoft Search Server 2010.

  The `HandlerName` property is not supported if your search provider is Microsoft Search Server 2010.

  The `DictionaryName` property is not supported if your search provider is Microsoft Search Server 2010.

QueryCompletionResponse

9.00 and higher

The QueryCompletionResponse class is a data structure which aggregates query completions for a partial search term, as predicted by the configured search provider.

Namespace

```
Ektron.Cms.Search.QueryCompletionResponse
```

Properties

- `QueryCompletions`. Gets or sets a collection of completed terms as predicted by the configured search provider.

Constructors

- `QueryCompletionResponse()`. Constructor.

QueryCompletionTerm

9.00 and higher

The QuerySuggestionTerm class is a data structure describing an individual, completed, query term as predicted by the configured search provider.

Namespace

```
Ektron.Cms.Search.QuerySuggestionTerm
```

Properties

- `Suggestion`. Gets or sets the predicted query term.

Constructors

- `QuerySuggestionTerm()`. Constructor.

QuerySuggestionResponse

9.00 and higher

The QuerySuggestionResponse class is a data structure which aggregates query completions for a partial search term, as predicted by the configured search provider.

Namespace

```
Ektron.Cms.Search.QuerySuggestionResponse
```

Properties

- `QuerySuggestions`. Gets or sets a collection of suggested terms as predicted by the configured search provider.

Constructors

- `QuerySuggestionResponse()`. Constructor.

QuerySuggestionTerm

9.00 and higher

The QuerySuggestionTerm class is a data structure describing an individual, completed, query term as predicted by the configured search provider.

Namespace

```
Ektron.Cms.Search.QuerySuggestionTerm
```

Properties

- `Suggestion`. Gets or sets the predicted query term.

Constructors

- `QuerySuggestionTerm()`. Constructor.

8.60 and higher

Refinement

The Refinement class is a data structure identifying a specific subset of results to which a query should be restricted.

Namespace

```
Ektron.Cms.Search.Refinement
```

Properties

- `Data`. Gets or sets the data identifying this refinement.
- `Property`. Gets or sets the property associated with this refinement.

Constructors

- `Refinement()`. Constructor.
- `Refinement(PropertyExpression,String)`. Constructor.

Remarks

- `All Providers`. Add a `Refinement` to your search criteria to restrict a query to results classified by a specific facet bucket. Every `FacetBucket` includes a reference to a `Refinement`, which can be added to a subsequent query.
- `Search Server 2010`. The `Refinement` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.

RefinementCriteria

8.60 and higher

The RefinementCriteria class encapsulates all query criteria related to faceted search.

Namespace

```
Ektron.Cms.Search.RefinementCriteria
```

Properties

- `IsEnabled`. Gets or sets a flag indicating whether or not refinement functionality is enabled for a query.
- `Items`. Gets a read-only collection of the refinement information associated with this criteria.

Constructors

- `RefinementCriteria()`. Constructor.

Methods

- `Add(Refinement)`. Adds a specific refinement identifying a specific subset of results to which the query should be restricted.
- `Add(RefinementInfo)`. Add a `RefinementInfo` data structure to the criteria.
- `Add(RefinementSpecification<PropertyExpression>)`. Adds a RefinementSpecification identifying the facets that should be generated at query time.
- `Clear()`. Clears this criteria of any refinement specifications or restrictions that it may contain.

Remarks

- `All Providers`. Add a `RefinementSpecification` to this criteria to identify a field for which facet data should be returned with the query results.

  Add a `Refinement` to this criteria to restrict a query to results classified by a specific facet bucket. Every `FacetBucket` includes a reference to a `Refinement`, which can be added to a subsequent query.
- `Search Server 2010`. `RefinementCriteria` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.

RefinementInfo

8.60 and higher

The RefinementInfo class is a data structure describing individual refinement specifications and restrictions applied to a query.

Namespace

```
Ektron.Cms.Search.RefinementInfo
```

Properties

- `Property`. Gets or sets the property associated with this refinement information.
- `Refinements`. Gets the query refinement restrictions.
- `Specification`. Get or sets the query refinement specification.

Constructors

- `RefinementInfo()`. Constructor.
- `RefinementInfo(List<Refinement>)`. Constructor.
- `RefinementInfo(Refinement)`. Constructor.
- `RefinementInfo(RefinementSpecification<PropertyExpression>)`. Constructor.

RefinementSpecification

8.60 and higher

The RefinementSpecification class identifies a specific facet to be included in the search results.

Namespace

```
Ektron.Cms.Search.RefinementSpecification<T>
```

Properties

- `Property`. Gets or sets the refinement property.

Constructors

- `RefinementSpecification(T)`. Constructor.

Remarks

- `All Providers`. Add a `RefinementSpecification` to search criteria to identify a field for which facet data should be returned with the query results.
- `Search Server 2010`. The `RefinementSpecification` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.

SearchContentProperty

8.50 and higher

The ContentProperty class provides access to the PropertyExpressions which map default content properties to index fields.

Namespace

```
Ektron.Cms.Search.SearchContentProperty
```

Properties

- `AssetVersion`. Gets the PropertyExpression for the asset version path field.
- `Author`. Gets the PropertyExpression for the content author field.
- `ContentSubType`. Gets the PropertyExpression for the content subtype field.
- `ContentType`. Gets the PropertyExpression for the content type field.
- `DateCreated`. Gets the PropertyExpression for the content date created field.
- `DateModified`. Gets the PropertyExpression for the content date modified field.
- `Description`. Gets the PropertyExpression for the content description field.
- `ExpiryDate`. Gets the PropertyExpression for the content expiry date field.
- `ExpiryType`. Gets the PropertyExpression for the content expiry type field.
- `FolderId`. Gets the PropertyExpression for the folder ID field.
- `FolderIdPath`. Gets the PropertyExpression for the content folder ID path field.
- `FolderName`. Gets the PropertyExpression for the content folder name field.
- `FolderPath`. Gets the PropertyExpression for the content folder path field.

  NOTE: For more information on the `Folder` properties, see Recursive Folder Queries.

- `GoLiveDate`. Gets the PropertyExpression for the content go live date field.
- `HighlightedSummary`. Gets the PropertyExpression for the highlighted summary field.
- `Id`. Gets the PropertyExpression for the content ID field.
- `Language`. Gets the PropertyExpression for the content language field.
- `MapAddress`. Gets the PropertyExpression for the map address field.
- `MapDate`. Gets the PropertyExpression for the map date field.
- `MapLatitude`. Gets the PropertyExpression for the map latitude field.
- `MapLongitude`. Gets the PropertyExpression for the map longitude field.
- `Path`. Gets the PropertyExpression for the content path field.
- `Private`. Gets the PropertyExpresion for the field indicating whether or not the content is private.
- `QuickLink`. Gets the PropertyExpression for the QuickLink field.
- `Rank`. Gets the PropertyExpression for the rank field.
- `SiteId`. Gets the PropertyExpression for the ID of the parent site.
- `Size`. Gets the PropertyExpression for the content size field.
- `Tags`. Gets the PropertyExpression for the content tags field.

- `TaxonomyCategory`. Gets the PropertyExpression for the taxonomy category field.
- `Title`. Gets the PropertyExpression for the content title field.
- `XmlConfigId`. Gets the PropertyExpression for the content SmartForm ID field.

Remarks

- `All Providers`. The `HighlightedSummary` property expression is used to request a dynamically generated summary for each result item in your result set. This behavior varies from search provider to search provider. Its effectiveness also varies based on the quantity and quality of the data available in the index for a given piece of content. For example, XML-based content, such as Smart Form data, is less likely to render a meaningful summary than traditional textual content. It is recommended that static summaries are conditionally displayed for result items in cases where the dynamically generated one is insufficient.
- `Solr`. The `TaxonomyCategory` property is a multi-value field in Solr. Multi-value fields provide a better development experience when consuming field data representing a collection of values. It is recommended that you reference the `TaxonomyCategory` property as a multi-value property expression to ensure that you are always working with the complete data for your result item (See: StringMultiValuePropertyExpression class):

  ```
  SearchContentProperty.TaxonomyCategory.AsMultiValue()
  ```

  General keyword searches of hierarchical field data are not supported. Fields such as `TaxonomyCategory`, `FolderPath`, and `FolderIdPath` have been optimized for queries that are constructed using hierarchical paths. When querying this type of data, your input should be a rooted, fully formed path. For example, consider a taxonomy category of "\Departments\HR\Benefits." A query, against the taxonomy category field, with an input of "\Departments\HR," would return results associated with the category. A query with an input of "HR" would not.

  Solr will analyze the first 100,000 characters of an individual document when generating a `HighlightedSummary` value. For large content, a dynamic summary will not be generated if the search terms for your query are not found in the first 100,000 characters of the document.

SearchCriteria

8.50 and higher

The SearchCriteria class serves as a base for criteria defining a particular search query.

Namespace

```
Ektron.Cms.Search.SearchCriteria
```

Properties

- `EnableStemming`. Gets or sets a flag indicating whether or not stemming is enabled for the query.
- `ExpressionTree`. Gets and sets the logical expression tree for filtering results
- `IncludeSuggestedResults`. Gets and sets a flag indicating whether or not to retrieve suggested results in addition to the relevant search results.
- `Locale`. Gets and sets the query engine's target locale.
- `OrderBy`. Gets and sets the list of result ordering rules
- `PagingInfo`. Gets and sets the paging information
- `Permission`. Gets and sets the permissions with which to search
- `Refinement`. Gets or sets the criteria used to indicate how refinements should be applied to the query.

  NOTE: Query refinement is not supported by all search providers and may require some additional manual configuration.

- `ReturnProperties`. Gets and sets the list of columns to return in the results
- `Scope`. Gets and sets the scope information
- `Similarity`. Gets or sets the criteria used to refine the query to items that are most similar to a particular item. Note: Similarity search functionality is not supported by all search providers.

Constructors

- `SearchCriteria()`. Constructor.

SearchCustomProperty

8.50 and higher

The SearchCustomProperty class is a factory for property expressions targeting custom property fields.

Namespace

```
Ektron.Cms.Search.SearchCustomProperty
```

Methods

- `GetBooleanProperty(String)`. Gets a `BooleanPropertyExpression` representing the custom property field identified by the specified name value.
- `GetDateProperty(String)`. Gets a `DatePropertyExpression` representing the custom property field identified by the specified name value.
- `GetDecimalProperty(String)`. Gets a `DecimalPropertyExpression` representing the custom property field identified by the specified name value.

- `GetIntegerProperty(String)`. Gets a `IntegerPropertyExpression` representing the custom property field identified by the specified name value.
- `GetStringProperty(String)`. Gets a `StringPropertyExpression` representing the custom property field identified by the specified name value.

SearchECommerceProperty

8.50 and higher

The SearchECommerceProperty class provides access to the default PropertyExpressions for formulating e-commerce queries.

Namespace

```
Ektron.Cms.Search.SearchECommerceProperty
```

Properties

- `Buyable`. Gets the PropertyExpression for the buyable field.
- `CatalogNumber`. Gets the PropertyExpression for product folder ID field.
- `CurrencyId`. Gets the PropertyExpression for the currency ID field.
- `Description`. Gets the PropertyExpression for the product description field.
- `Discontinued`. Gets the PropertyExpression for the product discontinued field.
- `Height`. Gets the PropertyExpression for the product height field.
- `HighlightedSummary`. Gets the PropertyExpression for the highlighted product summary field.
- `Id`. Gets the PropertyExpression for product content ID field.
- `ImageUrl`. Gets the PropertyExpression for the product image field.
- `Language`. Gets the PropertyExpression for the product content language field.
- `Length`. Gets the PropertyExpression for the product length field.
- `ListPrice`. Gets the PropertyExpression for the list price field.
- `PathCategory`. Gets the PropertyExpression for the product content path field.
- `ProductType`. Gets the PropertyExpression for the product type field.
- `ProductTypeId`. Gets the PropertyExpression for the product type ID field.
- `Purchased`. Gets the PropertyExpression for the purchased field.
- `QuickLink`. Gets the PropertyExpression for the product QuickLink field.
- `Rank`. Gets the PropertyExpression for the result rank field.
- `SalePrice`. Gets the PropertyExpression for the sale price field.
- `Size`. Gets the PropertyExpression for the product content size field.
- `SkuNumber`. Gets the PropertyExpression for the SKU number field.
- `Title`. Gets the PropertyExpression for the product title field.
- `Weight`. Gets the PropertyExpression for the product weight field.
- `Width`. Gets the PropertyExpression for the product width field.

Remarks

- `All Providers`. The `HighlightedSummary` property expression is used to request a dynamically generated summary for each result item in your result set. This behavior varies from search provider to search provider. Its effectiveness also varies based on the quantity and quality of the data available in the index for a given piece of content. For example, XML-based content, such as Smart Form data, is less likely to render a meaningful summary than traditional textual content. It is recommended that static summaries are conditionally displayed for result items in cases where the dynamically generated one is insufficient.
- `Solr`. The `TaxonomyCategory` property is a multi-value field in Solr. Multi-value fields provide a better development experience when consuming field data representing a collection of values. It is recommended that you reference the `TaxonomyCategory` property as a multi-value property expression to ensure that you are always working with the complete data for your result item (See: StringMultiValuePropertyExpression class):

  ```
  SearchContentProperty.TaxonomyCategory.AsMultiValue()
  ```

  General keyword searches of hierarchical field data is not supported. Fields such as `TaxonomyCategory`, `FolderPath`, and `FolderIdPath` have been optimized for queries that are programmatically constructed. When querying this type of data, your input should be a rooted, fully formed, path. For example, consider a taxonomy category of "\Departments\HR\Benefits". A query, against the taxonomy category field, with an input of "\Departments\HR" would return results associated with the category. A query with an input of "HR" would not.

  Solr will analyze the first 100,000 characters of an individual document when generating a `HighlightedSummary` value. For large content, a dynamic summary will not be generated if the search terms for your query are not found in the first 100,000 characters of the document.

SearchGroupProperty

8.50 and higher

The GroupProperty class provides access to the default PropertyExpressions for formulating community group queries.

Namespace

```
Ektron.Cms.Search.SearchGroupProperty
```

Properties

- `Avatar`. Gets the PropertyExpression for the user avatar field.
- `CreatorId`. Gets the PropertyExpression for the group creator ID field.
- `DateModified`. Gets the PropertyExpression for the date modified field.

- `EmailAddress`. Gets the PropertyExpression for the email address field.
- `Enroll`. Gets the PropertyExpression for the enroll field.
- `HighlightedSummary`. Gets the PropertyExpression for the highlighted summary field.
- `Id`. Gets the PropertyExpression for the group ID field.
- `Location`. Gets the PropertyExpression for the location field.
- `LongDescription`. Gets the PropertyExpression for the long description field.
- `Name`. Gets the PropertyExpression for the name field.
- `Path`. Gets the PropertyExpression for the path field.
- `QuickLink`. Gets the PropertyExpression for the QuickLink field.
- `Rank`. Gets the PropertyExpression for the rank field.
- `ShortDescription`. Gets the PropertyExpression for the short description field.
- `Size`. Gets the PropertyExpression for the size field.
- `Tags`. Gets the PropertyExpression for the tags field.
- `TaxonomyCategory`. Gets the PropertyExpression for the taxonomy category field.
- `Title`. Gets the PropertyExpression for the title field.
- `Type`. Gets the PropertyExpression for the user type field.

Remarks

- `All Providers`. The `HighlightedSummary` property expression is used to request a dynamically generated summary for each result item in your result set. This behavior varies from search provider to search provider. Its effectiveness also varies based on the quantity and quality of the data available in the index for a given piece of content. For example, XML-based content, such as Smart Form data, is less likely to render a meaningful summary than traditional textual content. It is recommended that static summaries are conditionally displayed for result items in cases where the dynamically generated one is insufficient.
- `Solr`. The `TaxonomyCategory` property is a multi-value field in Solr. Multi-value fields provide a better development experience when consuming field data representing a collection of values. It is recommended that you reference the `TaxonomyCategory` property as a multi-value property expression to ensure that you are always working with the complete data for your result item (See: StringMultiValuePropertyExpression class):

  ```
  SearchContentProperty.TaxonomyCategory.AsMultiValue()
  ```

  General keyword searches of hierarchical field data is not supported. Fields such as `TaxonomyCategory`, `FolderPath`, and `FolderIdPath` have been optimized for queries that are programmatically constructed. When querying this type of data, your input should be a rooted, fully formed, path. For example, consider a taxonomy category of "\Departments\HR\Benefits". A query, against the

taxonomy category field, with an input of "\Departments\HR" would return results associated with the category. A query with an input of "HR" would not.

Solr will analyze the first 100,000 characters of an individual document when generating a `HighlightedSummary` value. For large content, a dynamic summary will not be generated if the search terms for your query are not found in the first 100,000 characters of the document.

SearchMetadataProperty

8.50 and higher

The SearchMetadataProperty class is a factory for property expressions targeting metadata fields.

Namespace

```
Ektron.Cms.Search.SearchMetadataProperty
```

Methods

- `GetBooleanProperty(String)`. Gets a `BooleanPropertyExpression` representing the metadata field identified by the specified name value.
- `GetDateProperty(String)`. Gets a `DatePropertyExpression` representing the metadata field identified by the specified name value.
- `GetDecimalProperty(String)`. Gets a `DecimalPropertyExpression` representing the metadata field identified by the specified name value.
- `GetIntegerProperty(String)`. Gets a `IntegerPropertyExpression` representing the metadata field identified by the specified name value.
- `GetStringProperty(String)`. Gets a `StringPropertyExpression` representing the metadata field identified by the specified name value.

SearchResponseData

8.50 and higher

The SearchResponseData class is a data structure delivering the results of a search query.

Namespace

```
Ektron.Cms.Search.SearchResponseData
```

Properties

- `ElapsedTime`. Gets or sets the elapsed execution time for the submitted query.
- `Facets`. Gets or sets a list of Facets corresponding to the search results.
- `PagingInfo`. Gets or sets the paging details for this result set.

- `Results`. Gets or sets a collection of results relevant to the submitted query.
- `SpellingSuggestion`. Gets or sets a spelling suggestion for the submitted query.
- `SuggestedResults`. Gets or sets a collection of suggested results relevant to the submitted query.
- `Terms`. Gets or sets a collection of search terms identified in submitted query.

Constructors

- `SearchResponseData()`. Constructor.

SearchResultData

8.50 and higher

The SearchResultData class represents an individual result item of a search query.

Namespace

```
Ektron.Cms.Search.SearchResultData
```

Properties

- `Item[BooleanMultiValuePropertyExpression]`. Gets and sets a collection of values for the specified boolean property.
- `Item[BooleanPropertyExpression]`. Gets and sets the value for the specified boolean property. If the value of the field is null, false is returned.
- `Item[DateMultiValuePropertyExpression]`. Gets and sets a collection of values for the specified date property.
- `Item[DatePropertyExpression]`. Gets and sets the value for the specified date property. If the value of the field is null, DateTime.MinValue is returned.
- `Item[DecimalMultiValuePropertyExpression]`. Gets and sets a collection of values for the specified decimal property.
- `Item[DecimalPropertyExpression]`. Gets and sets the value for the specified decimal property. If the value of the field is null, 0 is returned.
- `Item[IntegerMultiValuePropertyExpression]`. Gets and sets a collection of values for the specified integer property.
- `Item[IntegerPropertyExpression]`. Gets and sets the value for the specified integer property. If the value of the field is null, 0 is returned.
- `Item[String]`. Gets and sets the value for the specified property. If the value of the field is null, DBNull is returned.
- `Item[StringMultiValuePropertyExpression]`. Gets and sets a collection of values for the specified string property.
- `Item[StringPropertyExpression]`. Gets and sets the value for the specified string property. If the value of the field is null, String.Empty is returned.
- `PropertyCount`. Returns the number of fields in this result item.

- `Similarity`. Gets or sets datac describing how closely this result item relates to other items in the result set.

Constructors

- `SearchResultData()`. Constructor.
- `SearchResultData(DataRow)`. Constructor.
- `SearchResultData(IDictionary<String>,Object>)`. Constructor.

Methods

- `GetValue(BooleanMultiValuePropertyExpression)`. Gets a collection of values associated with the specified property.
- `GetValue(BooleanPropertyExpression)`. Returns the value of the field associated with the specified property.
- `GetValue(DateMultiValuePropertyExpression)`. Gets a collection of values associated with the specified property.
- `GetValue(DatePropertyExpression)`. Returns the value of the field associated with the specified property.
- `GetValue(DecimalMultiValuePropertyExpression)`. Gets a collection of values associated with the specified property.
- `GetValue(DecimalPropertyExpression)`. Returns the value of the field associated with the specified property.
- `GetValue(IntegerMultiValuePropertyExpression)`. Gets a collection of values associated with the specified property.
- `GetValue(IntegerPropertyExpression)`. Returns the value of the field associated with the specified property.
- `GetValue(String)`. Returns the values of the field associated with the specified property. If the value represents a single-value result, the single-value form is returned. If the value represents a multi-value result, the multi-value (collection) form is returned.
- `GetValue(StringMultiValuePropertyExpression)`. Gets a collection of values associated with the specified property.
- `GetValue(StringPropertyExpression)`. Returns the value of the field associated with the specified property.
- `HasColumn(PropertyExpression)`. Returns true if the specified property exists in the result item.
- `HasProperty(String)`. Returns true if the specified property exists in the result item.
- `IsMultiValue(PropertyExpression)`. Returns true if the field associated with the specified property expression represents a collection of values.
- `IsMultiValue(String)`. Returns true if the field associated with the specified property expression represents a collection of values.

- `IsNull(PropertyExpression)`. Returns true if the value of the specified field is null.
- `IsNull(String)`. Returns true if the value of the specified field is null.
- `SetValue(BooleanMultiValuePropertyExpression,IEnumerable<Boolean>)`. Sets a value for the specified boolean property.
- `SetValue(BooleanPropertyExpression,Boolean)`. Sets a value for the specified boolean property.
- `SetValue(DateMultiValuePropertyExpression,IEnumerable<DateTime>)`. Sets a value for the specified date property.
- `SetValue(DatePropertyExpression,DateTime)`. Sets a value for the specified date property.
- `SetValue(DecimalMultiValuePropertyExpression,IEnumerable<Double>)`. Sets a value for the specified decimal property.
- `SetValue(DecimalPropertyExpression,Double)`. Sets a value for the specified decimal property.
- `SetValue(IntegerMultiValuePropertyExpression,IEnumerable<Int64>)`. Sets a collection of values for the specified integer property.
- `SetValue(IntegerPropertyExpression,Int64)`. Sets a value for the specified integer property.
- `SetValue(String,Object)`. Sets a value for the specified property.
- `SetValue(StringMultiValuePropertyExpression,IEnumerable<String>)`. Sets a collection of values for the specified string property.
- `SetValue(StringPropertyExpression,String)`. Sets a value for the specified string property.

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported if your search provider is Microsoft FAST Search for SharePoint 2010. Accessors and methods on this class, accepting a multi-value property expression, should not be used.
- `Search Server 2010`. Multi-value properties are not supported if your search provider is Microsoft Search Server 2010. Accessors and methods on this class, accepting a multi-value property expression, should not be used.
- `Solr`. When accessing data for a multi-value property, your input to the relevant accessors and methods on this class should be a multi-value property expression. A collection of data is returned.

  If multi-value data is accessed with a traditional, single-value, property expression only the first item in that field's collection is returned. Use a multi-value property expression to ensure that you are working with the complete set of data.

If single-value data is accessed with a multi-value property expression an exception is thrown.

SearchSmartFormProperty

8.50 and higher

The SearchSmartFormProperty class is a factory for property expressions targeting Smart Form fields.

Namespace

```
Ektron.Cms.Search.SearchSmartFormProperty
```

Methods

- `GetBooleanProperty(String)`. Gets a `BooleanPropertyExpression` representing the Smart Form field identified by the specified `XPath` value.
- `GetDateProperty(String)`. Gets a `DatePropertyExpression` representing the Smart Form field identified by the specified `XPath` value.
- `GetDecimalProperty(String)`. Gets a `DecimalPropertyExpression` representing the Smart Form field identified by the specified `XPath` value.
- `GetIntegerProperty(String)`. Gets a `IntegerPropertyExpression` representing the Smart Form field identified by the specified `XPath` value.
- `GetStringProperty(String)`. Gets a `StringPropertyExpression` representing the Smart Form field identified by the specified `XPath` value.

Remarks

- `All Providers`. When creating a `PropertyExpression` for an indexed Smart Form field, specify the XPath expression denoting the desired element. (For example: `root/video/description`)

  The XPath expressions for Smart Form fields can be found on the "Display Information" tab when viewing a Smart Form Configuration in Workarea of your site.

- `Solr`. All indexed Smart Form fields are stored as multi-value fields when your search provider is Apache Solr.

  Smart Form fields cannot be sorted on. Apache Solr does not support the sorting of multi-value fields. If sorting behavior is required for data associated with Smart Form content, please consider using a companion metadata definition.

SearchSolrProperty

9.00 and higher

The SearchSolrProperty class exposes enhanced functionality around PropertyExpressions representing Solr index fields. This provides access to behavior unique to the Solr search engine.

Namespace

```
Ektron.Cms.Search.Solr.SearchSolrProperty
```

Properties

- `SearchSolrProperty()` (Static). Constructor.
- `CreateExactStringProperty(StringMultiValuePropertyExpression)`. Creates a property expression referencing the exact-match companion field for the specified property expression. These companion fields provide access to an untokenized and unfiltered representation of CMS property data, which can be particularly useful for performing exact term matches and requesting refinements. Note: Companion fields for Ektron properties are always multi-value fields.
- `CreateExactStringProperty(StringPropertyExpression)`. Creates a property expression referencing the exact-match companion field for the specified property expression. These companion fields provide access to an untokenized and unfiltered representation of CMS property data, which can be particularly useful for performing exact term matches and requesting refinements.

  NOTE: Companion fields for Ektron properties are always multi-value fields.

- `CreateExactStringProperty(String)`. Creates a property expression referencing the exact-match companion field for the specified property expression. These companion fields provide access to an untokenized and unfiltered representation of CMS property data, which can be particularly useful for performing exact term matches and requesting refinements. Note: Companion fields for Ektron properties are always multi-value fields.
- `CreateStringSortProperty(String)`. Creates a property expression referencing the explicit single value companion field for the specified property expression. Note: This is an internal function used to resolve companion index fields (particularly for Smart Form fields) where we must act on a multi-value field as if it were a single value field.
- `CreateIntegerSortProperty(String)`. Creates a property expression referencing the explicit single value companion field for the specified property expression. Note: This is an internal function used to resolve companion index fields (particularly for Smart Form fields) where we must act on a multi-value field as if it were a single value field.
- `CreateDecimalSortProperty(String)`. Creates a property expression referencing the explicit single value companion field for the specified property expression. Note: This is an internal function used to resolve companion index

fields (particularly for Smart Form fields) where we must act on a multi-value field as if it were a single value field.

- `CreateDateSortProperty(String)`. Creates a property expression referencing the explicit single value companion field for the specified property expression. Note: This is an internal function used to resolve companion index fields (particularly for Smart Form fields) where we must act on a multi-value field as if it were a single value field.
- `CreateBooleanSortProperty(String)`. Creates a property expression referencing the explicit single value companion field for the specified property expression. Note: This is an internal function used to resolve companion index fields (particularly for Smart Form fields) where we must act on a multi-value field as if it were a single value field.

SearchType

8.50 and higher

Helper class for generating expressions to limit search result types.

Namespace

```
Ektron.Cms.Search.SearchType
```

Methods

- `IsContent()`. Generates an expression that limits search result type to content.
- `IsDocument()`. Generates an expression that limits search result type to CMS documents. Any valid document types added using the CMS, such as office files, images, PDF or multimedia are included when limiting results by using this property (Please note that valid file types are defined in the Asset Server Setup in the Settings section of Workarea of your site).
- `IsExternal()`. Generates an expression that limits search result type to groups.
- `IsForum()`. Generates an expression that limits search result type to forums.
- `IsGroup()`. Generates an expression that limits search result type to groups.
- `IsMultimedia()`. Generates an expression that limits search result type to multimedia.
- `IsNonUserContent()`. Generates an expression that limits search result type to content.
- `IsProduct()`. Generates an expression that limits search result type to products.
- `IsUser()`. Generates an expression that limits search result type to users.

SearchUserProperty

8.50 and higher

The UserProperty class provides access to the default PropertyExpressions for formulating user queries.

Namespace

```
Ektron.Cms.Search.SearchUserProperty
```

Properties

- `Avatar`. Gets the PropertyExpression for the user avatar field.
- `DateModified`. Gets the PropertyExpression for the date modified field.
- `DisplayName`. Gets the PropertyExpression for the display name field.
- `EmailAddress`. Gets the PropertyExpression for the email address field.
- `FirstName`. Gets the PropertyExpression for the first name field.
- `HighlightedSummary`. Gets the PropertyExpression for the highlighted summary field.
- `Id`. Gets the PropertyExpression for the user ID field.
- `Language`. Gets the PropertyExpression for the user language field.
- `LastName`. Gets the PropertyExpression for the last name field.
- `MapAddress`. Gets the PropertyExpression for the map address field.
- `MapLatitude`. Gets the PropertyExpression for the map latitude field.
- `MapLongitude`. Gets the PropertyExpression for the map longitude field.
- `MembershipUser`. Gets the PropertyExpression for the membership user field.
- `Path`. Gets the PropertyExpression for the path field.
- `PrivateProfile`. Gets the PropertyExpression for the private profile field.
- `QuickLink`. Gets the PropertyExpression for the QuickLink field.
- `Rank`. Gets the PropertyExpression for the rank field.
- `Size`. Gets the PropertyExpression for the content size field.
- `Tags`. Gets the PropertyExpression for the user tags field.
- `TaxonomyCategory`. Gets the PropertyExpression for the taxonomy category field.
- `Type`. Gets the PropertyExpression for the user type field.
- `UserFriends`. Gets the PropertyExpression for the user fiends field.
- `UserName`. Gets the PropertyExpression for the user name field.

Remarks

- `All Providers`. The `HighlightedSummary` property expression is used to request a dynamically generated summary for each result item in your result set. This behavior varies from search provider to search provider. Its effectiveness also varies based on the quantity and quality of the data available in the index for a given piece of content. For example, XML-based content, such as Smart Form data, is less likely to render a meaningful summary than

traditional textual content. It is recommended that static summaries are conditionally displayed for result items in cases where the dynamically generated one is insufficient.

- `Solr`. The `TaxonomyCategory` property is a multi-value field in Solr. Multi-value fields provide a better development experience when consuming field data representing a collection of values. It is recommended that you reference the `TaxonomyCategory` property as a multi-value property expression to ensure that you are always working with the complete data for your result item (See: StringMultiValuePropertyExpression class):

  ```
  SearchContentProperty.TaxonomyCategory.AsMultiValue()
  ```

  General keyword searches of hierarchical field data is not supported. Fields such as `TaxonomyCategory`, `FolderPath`, and `FolderIdPath` have been optimized for queries that are programmatically constructed. When querying this type of data, your input should be a rooted, fully formed, path. For example, consider a taxonomy category of "\Departments\HR\Benefits". A query, against the taxonomy category field, with an input of "\Departments\HR" would return results associated with the category. A query with an input of "HR" would not.

  Solr will analyze the first 100,000 characters of an individual document when generating a `HighlightedSummary` value. For large content, a dynamic summary will not be generated if the search terms for your query are not found in the first 100,000 characters of the document.

StringFacet

8.60 and higher

The StringFacet class represents a classification of search results on a string index field.

Namespace

```
Ektron.Cms.Search.StringFacet
```

Properties

- `Buckets`. Gets or sets the collection of facet buckets associated with this facet.
- `Property`. Gets or sets the property associated with this facet.

Constructors

- `StringFacet(PropertyExpression)`. Constructor.
- `StringFacet (PropertyExpression,ICollection<UniqueFacetBucket<String>>)`. Constructor.
- `StringFacet(StringMultiValuePropertyExpression)`. Constructor.

- `StringFacet (StringMultiValuePropertyExpression,ICollection<UniqueFacetBucket <String>>)`. Constructor.
- `StringFacet(StringPropertyExpression)`. Constructor.
- `StringFacet (StringPropertyExpression,ICollection<UniqueFacetBucket<String>>)` . Constructor.

StringRefinementSpecification

8.60 and higher

The StringRefinementSpecification represents a strongly typed refinement specification for string index properties.

Namespace

```
Ektron.Cms.Search.StringRefinementSpecification
```

Properties

- `Filter`. Hidden until this functionality becomes available.
- `Order`. Hidden until this functionality becomes available.
- `Property`. Gets or sets the refinement property.

Constructors

- `StringRefinementSpecification()`. Constructor.
- `StringRefinementSpecification (StringMultiValuePropertyExpression)`. Constructor.
- `StringRefinementSpecification (StringMultiValuePropertyExpression,RefinementOrderData)`. Constructor.
- `StringRefinementSpecification (StringMultiValuePropertyExpression,String)`. Constructor.
- `StringRefinementSpecification (StringMultiValuePropertyExpression,String,RefinementOrderData)`. Constructor.
- `StringRefinementSpecification(StringPropertyExpression)`. Constructor.
- `StringRefinementSpecification (StringPropertyExpression,RefinementOrderData)`. Constructor.
- `StringRefinementSpecification(StringPropertyExpression,String)`. Constructor.
- `StringRefinementSpecification (StringPropertyExpression,String,RefinementOrderData)`. Constructor.

Remarks

- `All Providers`. Add a `StringRefinementSpecification` to search criteria to identify a field for which facet data should be returned with the query results.
- `Search Server 2010`. The `StringRefinementSpecification` is not applicable if your search provider is Microsoft Search Server 2010. Deep refinement of result sets is not available.
- `Solr`. The terms used to generate string facets reflect the tokenization and filtering applied to the target index field when your search provider is Apache Solr. Often, it is better to reference a string field with minimal tokenization and filtering to achieve the best experience.

  All indexed Ektron properties have an exact-match companion field, which provides access to an untokenized and unfiltered representation of the property's data. When requesting string-based refinements, these fields often provide the desired experience. (To access these fields, see the `SearchSolrProperty` class.)

SimilarityResponseData

8.60 and higher

The SimilarityResponseData class encapsulates information describing how closely a result item relates to other items in the result set.

Namespace

```
Ektron.Cms.Search.SimilarityResponseData
```

Properties

- `SimilarityVector`. Gets or sets a collection of similar tokens that provide document term relevancy data.

Constructors

- `SimilarityResponseData()`. Constructor.

SimilaritySearchCriteria

8.60 and higher

The SimilaritySearchCriteria class captures metadata associated with a particular result item. This data is used to refine the parent query to a set of results that are similar to that result item.

Namespace

```
Ektron.Cms.Search.SimilaritySearchCriteria
```

Properties

- `IsEnabled`. Gets or sets a flag indicating whether or not similarity search should be enabled for the parent query.
- `QueryType`. Gets or sets the type of similarity query to be issued.
- `SimilarityVector`. Gets a document vector describing a particular indexed item which is to be evaluated by the search provider, identifying other similar documents.

Constructors

- `SimilaritySearchCriteria()`. Constructor.

SuggestedResultsData

8.50 and higher

Defines a suggested search result.

Namespace

```
Ektron.Cms.Search.SuggestedResultData
```

Properties

- `Description`. Gets and sets the description of the suggested result.
- `Title`. Gets and sets the title of the suggested result.
- `Url`. Gets and sets the URL of the suggested result.

Methods

- `Equals(Object)`. Returns true if the specified suggested result is equal to this instance.
- `GetHashCode()`. Returns the hash code for this instance of `SuggestedResultData`.
- `ToString()`. Returns the string representation of this instance of `SuggestedResultData`.

UniqueFacetBucket

8.60 and higher

The UniqueFacetBucket class describes a facet bucket representing a single unique value.

Namespace

Ektron.Cms.Search.UniqueFacetBucket<T>

Properties

- `Value`. Gets or sets the value associated with this facet bucket.

Constructors

- `UniqueFacetBucket(T,Int64)`. Constructor.

Search Exceptions

AllNoiseException

8.60 and higher

The AllNoiseException occurs when a query submitted for search consists entirely of noise words.

Namespace

```
Ektron.Cms.Search.AllNoiseException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `AllNoiseException()`. Constructor.
- `AllNoiseException(Exception)`. Constructor.
- `AllNoiseException(String)`. Constructor.
- `AllNoiseException(String,Exception)`. Constructor.

DuplicateSuggestedResultException

8.50 and higher

A `DuplicateSuggestedResultException` occurs when an attempt is made to save a suggested result that already exists in the system.

Namespace

```
Ektron.Cms.Search.DuplicateSuggestedResultException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.
- `Duplicates`. Gets or sets a dictionary of duplicate terms (mapped to the primary phrase with which they are associated).

Methods

- `DuplicateSuggestedResultException()`. Constructor.
- `DuplicateSuggestedResultException(Exception)`. Constructor.
- `DuplicateSuggestedResultException(String)`. Constructor.
- `DuplicateSuggestedResultException(String,Exception)`. Constructor.

DuplicateSynonymException

8.50 and higher

A DuplicateSynonymException occurs when an attempt is made to save a synonym that already exists in the system.

Namespace

```
Ektron.Cms.Search.DuplicateSynonymException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `DuplicateSynonymException()`. Constructor.
- `DuplicateSynonymException(Exception)`. Constructor.
- `DuplicateSynonymException(String)`. Constructor.
- `DuplicateSynonymException(String,Exception)`. Constructor.

EmptyQueryException

8.50 and higher

The `EmptyQueryException` is thrown when criteria submitted for search contains an empty query.

Namespace

```
Ektron.Cms.Search.EmptyQueryException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `EmptyQueryException()`. Constructor.
- `EmptyQueryException(Exception)`. Constructor.
- `EmptyQueryException(String)`. Constructor.
- `EmptyQueryException(String,Exception)`. Constructor.

EmptyReturnPropertiesException

8.50 and higher

The `EmptyReturnPropertiesException` occurs when a query criteria is submitted with an empty collection of return properties.

Namespace

```
Ektron.Cms.Search.EmptyReturnPropertiesException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `EmptyReturnPropertiesException()`. Constructor.
- `EmptyReturnPropertiesException(Exception)`. Constructor.
- `EmptyReturnPropertiesException(String)`. Constructor.
- `EmptyReturnPropertiesException(String,Exception)`. Constructor.

InvalidOrderByException

8.50 and higher

The `InvalidOrderByException` occurs when the OrderBy criteria is applied in a manner that is not supported by the search provider.

Namespace

```
Ektron.Cms.Search.InvalidOrderByException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `InvalidOrderByException()`. Constructor.
- `InvalidOrderByException(Exception)`. Constructor.
- `InvalidOrderByException(String)`. Constructor.
- `InvalidOrderByException(String,Exception)`. Constructor.

InvalidPropertyException

8.50 and higher

The `InvalidPropertyException` occurs when a property referenced in the query does not exist in the system or is used in a manner which is not supported.

Namespace

```
Ektron.Cms.Search.InvalidPropertyException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `InvalidPropertyException()`. Constructor.
- `InvalidPropertyException(Exception)`. Constructor.
- `InvalidPropertyException(String)`. Constructor.
- `InvalidPropertyException(String,Exception)`. Constructor.

InvalidScopeException

8.50 and higher

The `InvalidScopeException` occurs when the scope specified in the query criteria is invalid or does not exist.

Namespace

```
Ektron.Cms.Search.InvalidScopeException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `InvalidScopeException()`. Constructor.
- `InvalidScopeException(Exception)`. Constructor.

- `InvalidScopeException(String)`. Constructor.
- `InvalidScopeException(String,Exception)`. Constructor.

MalformedExpressionException

8.50 and higher

The `MalformedExpressionException` is raised when an invalid expression is used in a query.

Namespace

```
Ektron.Cms.Search.MalformedExpressionException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `MalformedExpressionException()`. Constructor.
- `MalformedExpressionException(Exception)`. Constructor.
- `MalformedExpressionException(Exception,String)`. Constructor.
- `MalformedExpressionException(String)`. Constructor.
- `MalformedExpressionException(String,Exception)`. Constructor.

NoResultsException

8.50 and higher

The `NoResultsException` occurs when a query yields no results.

Namespace

```
Ektron.Cms.Search.NoResultsException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `NoResultsException()`. Constructor.
- `NoResultsException(Exception)`. Constructor.
- `NoResultsException(String)`. Constructor.
- `NoResultsException(String,Exception)`. Constructor.

SearchAuthorizationException

8.50 and higher

The `SearchAuthorizationException` occurs when authentication with the search system fails.

Namespace

```
Ektron.Cms.Search.SearchAuthorizationException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `SearchAuthorizationException()`. Constructor.
- `SearchAuthorizationException(Exception)`. Constructor.
- `SearchAuthorizationException(String)`. Constructor.
- `SearchAuthorizationException(String,Exception)`. Constructor.

SearchException

8.50 and higher

The `SearchException` indicates that an error has occurred while performing a search-related activity.

Namespace

```
Ektron.Cms.Search.SearchException
```

Properties

- `Details`. Gets or sets any additional details associate with this exception.

Methods

- `SearchException()`. Constructor.
- `SearchException(Exception)`. Constructor.
- `SearchException(String)`. Constructor.
- `SearchException(String,Exception)`. Constructor.

Search Expressions

AndExpression

8.60 and higher

Defines an expression representing an "and" operator.

Namespace

```
Ektron.Cms.Search.Expressions.AndExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to process the current expression.
- `AndExpression()`. Constructor.
- `AndExpression(Expression,Expression)`. Constructor.

BinaryExpression

8.50 and higher

Defines an expression representing a binary operator.

Namespace

```
Ektron.Cms.Search.Expressions.BinaryExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `ValidateComparisonExpression(Expression,Expression)`. Validates a comparison expression in which the 'left' expression must be of type PropertyExpression and the 'right' expression must be of type ValueExpression.

BooleanMultiValuePropertyExpression

9.00 and higher

Defines an expression representing a boolean index field which may contain multiple values.

Namespace

```
Ektron.Cms.Search.Expressions.BooleanMultiValuePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `BooleanMultiValuePropertyExpression(String)`. Constructor.
- `Contains(Boolean)`. Constructs a ContainsExpression using the current object as its left branch and the specified value as its right branch.
- `IsNotNull()`. Creates an 'IsNull' expression. (Not supported)
- `IsNull()`. Creates an 'IsNotNull' expression. (Not supported)

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported when your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. Multi-value properties are not supported when your search provider is Microsoft Search Server 2010.
- `Solr`. Field names in Apache Solr are case-sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

BooleanPropertyExpression

8.50 and higher

Defines an expression representing a boolean index field.

Namespace

```
Ektron.Cms.Search.Expressions.BooleanPropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to process the current expression.
- `AsMultiValue()`. Returns a reference to the multi-value form of this property expression, typically used to retrieve a collection of values from the index.

  NOTE: An index field must be specifically configured to process multi-value data for this to be applicable. Not all search providers support this behavior.

- `BooleanPropertyExpression(String)`. Constructor.
- `EqualTo(Boolean)`. Constructs an EqualsExpression using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `NotEqualTo(Boolean)`. Constructs an NotEqualsExpression using the current object as its left-branch, and the given parameter "value" as its right-branch.

Remarks

- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

BooleanValueExpression

8.50 and higher

Defines an expression representing a boolean value.

Namespace

```
Ektron.Cms.Search.Expressions.BooleanValueExpression
```

Properties

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.

ContainsExpression

8.50 and higher

Defines an expression representing a "contains" operator.

Namespace

```
Ektron.Cms.Search.Expressions.ContainsExpression
```

Properties

- `Forms`. Gets or sets which alternative word forms should also be considered when searching for the specified phrase.
- `Phrase`. Gets or sets the search phrase for this expression.
- `Property`. Gets the property to evaluate.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `ContainsExpression()`. Constructor.
- `ContainsExpression(BooleanMultiValuePropertyExpression,Boolean)`. Constructor.
- `ContainsExpression(DateMultiValuePropertyExpression,DateTime)`. Constructor.
- `ContainsExpression(DecimalMultiValuePropertyExpression,Double)`. Constructor.
- `ContainsExpression(IntegerMultiValuePropertyExpression,Int64)`. Constructor.
- `ContainsExpression(PropertyExpression,Expression)`. Constructor.
- `ContainsExpression(PropertyExpression,Expression,WordForms)`. Constructor.
- `ContainsExpression(String)`. Constructor.
- `ContainsExpression(StringMultiValuePropertyExpression,String)`. Constructor.
- `ContainsExpression(StringPropertyExpression,String)`. Constructor.
- `ContainsExpression (StringPropertyExpression,StringValueExpression)`. Constructor.
- `ContainsExpression(StringPropertyExpression,String,WordForms)`. Constructor.
- `ContainsExpression(String,WordForms)`. Constructor.

Remarks

- `All Providers`. Use caution when including special characters in your expressions as your search provider may interpret these as wildcards. This can have an unintended performance impact. Consult your search provider vendor's documentation for information regarding how to safely escape these characters.
- `FAST Search for Sharepoint 2010`. The `WordForms` parameter is not supported when your search provider is Microsoft FAST Search for SharePoint. Instead, use the fields exposed directly on the KeywordSearchCriteria class (EnableStemming, and so on) to modify this behavior.

- `Solr`. The `WordForms` parameter is not supported when your search provider is Apache Solr. Stemming and other similar features cannot be toggled at query-time. They are configured on a field by field basis in the `schema.xml` for a given Solr core. If a different behavior is required, you should consider customizing the index schema for your site.

DateMultiValuePropertyExpression

9.00 and higher

Defines an expression representing a date index field which may contain multiple values.

Namespace

```
Ektron.Cms.Search.Expressions.DateMultiValuePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `Contains(DateTime)`. Constructs a ContainsExpression using the current object as its left branch and the specified value as its right branch.
- `DateMultiValuePropertyExpression(String)`. Constructor.
- `IsNotNull()`. Creates an 'IsNull' expression. (Not supported)
- `IsNull()`. Creates an 'IsNotNull' expression. (Not supported)

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported when your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. Multi-value properties are not supported when your search provider is Microsoft Search Server 2010.
- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

DatePropertyExpression

8.50 and higher

Defines an expression representing a date index field.

Namespace

```
Ektron.Cms.Search.Expressions.DatePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node
- `AsMultiValue()`. Returns a reference to the multi-value form of this property expression, typically used to retrieve a collection of values from the index.

  NOTE: An index field must be specifically configured to process multi-value data for this to be applicable. Not all search providers support this behavior.

- `DatePropertyExpression(String)`. Constructor.
- `EqualTo(DateTime)`. Constructs an `EqualToExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThan(DateTime)`. Constructs a `GreaterThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThanOrEqualTo(DateTime)`. Constructs a `GreaterThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThan(DateTime)`. Constructs an `LessThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThanOrEqualTo(DateTime)`. Constructs an `LessThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `NotEqualTo(DateTime)`. Constructs an `NotEqualToExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.

Remarks

- `Solr`. Field names in Apache Solr are case-sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

DateValueExpression

8.50 and higher

Defines an expression representing a date value.

Namespace

```
Ektron.Cms.Search.Expressions.DateValueExpression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.

DecimalMultiValuePropertyExpression

9.00 and higher

Defines an expression representing a decimal index field which may contain multiple values.

Namespace

```
Ektron.Cms.Search.Expressions.DecimalMultiValuePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `Contains(Double)`. Constructs a ContainsExpression using the current object as its left branch and the specified value as its right branch.
- `DecimalMultiValuePropertyExpression(String)`. Constructor.
- `IsNotNull()`. Creates an 'IsNull' expression. (Not supported)
- `IsNull()`. Creates an 'IsNotNull' expression. (Not supported)

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported when your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. Multi-value properties are not supported when your search provider is Microsoft Search Server 2010.

- `Solr`. Field names in Apache Solr are case-sensitive. When constructing a PropertyExpression for a custom Solr index field, ensure that the proper casing is applied.

DecimalPropertyExpression

8.50 and higher

Defines an expression representing a decimal index field.

Namespace

```
Ektron.Cms.Search.Expressions.DecimalPropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `AsMultiValue()`. Returns a reference to the multi-value form of this property expression, typically used to retrieve a collection of values from the index.

  NOTE: An index field must be specifically configured to process multi-value data for this to be applicable. (Not all search providers support this behavior.)

- `DecimalPropertyExpression(String)`. Constructor.
- `EqualTo(Double)`. Constructs an `EqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThan(Double)`. Constructs a `GreaterThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThanOrEqualTo(Double)`. Constructs a `GreaterThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThan(Double)`. Constructs a `LessThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThanOrEqualTo(Double)`. Constructs a `LessThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `NotEqualTo(Double)`. Constructs a `NotEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.

Remarks

- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

DecimalValueExpression

8.50 and higher

Defines an expression representing a decimal value.

Namespace

```
Ektron.Cms.Search.Expressions.DecimalValueExpression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.

EqualsExpression

8.50 and higher

Defines an expression representing an "equals" operator.

Namespace

```
Ektron.Cms.Search.Expressions.EqualsExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `EqualsExpression()`. Constructor.
- `EqualsExpression(BooleanPropertyExpression,Boolean)`. Constructor.
- `EqualsExpression(DatePropertyExpression,DateTime)`. Constructor.
- `EqualsExpression(DecimalPropertyExpression,Double)`. Constructor.
- `EqualsExpression(Expression,Expression)`. Constructor.
- `EqualsExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `EqualsExpression(StringPropertyExpression,String)`. Constructor.

Remarks

- `All Providers`. Use the `EqualsExpression` with caution when applied to string properties. Any variance between the field value and the target value will result in a non-match. Often, a `ContainsExpression` is more appropriate.

  The precision of decimal fields can vary from provider to provider. Consider querying a range of values rather than applying an exact equality statement in these cases.

- `Solr`. The `EqualsExpression` is evaluated in a case sensitive manner.

  Exact-match comparisons for text fields (`StringPropertyExpression` and `StringMultiValuePropertyExpression`) are given special handling. String equality of tokenized textual data is not supported in Solr. Instead, exact-match comparisons must be performed against an untokenized version of the text data. To achieve the appropriate behavior, the Ektron search API will automatically re-target string equality expressions to an untokenized companion field.

  When adding a custom text field to your site's schema, you should also add an exact match companion field. The companion field is required for any literal string comparisons (string equality) appearing in your queries. Failure to add this companion field will result in an error if the `EqualsExpression` appears in a query. (See the `schema.xml` for your site for additional information.)

Expression

8.50 and higher

Abstract class defining the base logical search expression.

Namespace

```
Ektron.Cms.Search.Expressions.Expression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `And(Expression)`. Returns an AND expression of this expression and the specified right expression.
- `And(IEnumerable<Expression>)`. Returns a list of terms ANDed together.
- `op_BitwiseAnd(Expression,Expression)`. Returns an AND expression for the specified left and right expressions.
- `op_BitwiseOr(Expression,Expression)`. Returns an OR expression for the specified left and right expressions.
- `op_LogicalNot(Expression)`. Returns an expression negating the specified expression.

- `Or(Expression)`. Returns an OR expression of this expression and the specified right expression.
- `Or(IEnumerable<Expression>)`. Returns a list of terms ORed together.

GreaterThanExpression

8.50 and higher

Defines an expression representing a "greater-than" operator.

Namespace

```
Ektron.Cms.Search.Expressions.GreaterThanExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `GreaterThanExpression()`. Constructor.
- `GreaterThanExpression(DatePropertyExpression,DateTime)`. Constructor.
- `GreaterThanExpression(DecimalPropertyExpression,Double)`. Constructor.
- `GreaterThanExpression(Expression,Expression)`. Constructor.
- `GreaterThanExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `GreaterThanExpression(StringPropertyExpression,String)`. Constructor.

GreaterThanOrEqualsExpression

8.50 and higher

Defines an expression representing a "greater-than-or-equals" operator.

Namespace

```
Ektron.Cms.Search.Expressions.GreaterThanOrEqualsExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `GreaterThanOrEqualsExpression()`. Constructor.
- `GreaterThanOrEqualsExpression(DatePropertyExpression,DateTime)`. Constructor.
- `GreaterThanOrEqualsExpression(DecimalPropertyExpression,Double)`. Constructor.
- `GreaterThanOrEqualsExpression(Expression,Expression)`. Constructor.
- `GreaterThanOrEqualsExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `GreaterThanOrEqualsExpression(StringPropertyExpression,String)`. Constructor.

IntegerMultiValuePropertyExpression

9.00 and higher

Defines an expression representing a integer index field which may contain multiple values.

Namespace

```
Ektron.Cms.Search.Expressions.IntegerMultiValuePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `Contains(Int64)`. Constructs a ContainsExpression using the current object as its left branch and the specified value as its right branch.
- `IntegerMultiValuePropertyExpression(String)`. Constructor.
- `IsNotNull()`. Creates an 'IsNull' expression. (Not supported)
- `IsNull()`. Creates an 'IsNotNull' expression. (Not supported)

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported when your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. Multi-value properties are not supported when your search provider is Microsoft Search Server 2010.
- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

IntegerPropertyExpression

8.50 and higher

Defines an expression representing a integer index field.

Namespace

```
Ektron.Cms.Search.Expressions.IntegerPropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node
- `AsMultiValue()`. Returns a reference to the multi-value form of this property expression, typically used to retrieve a collection of values from the index.

  NOTE: An index field must be specifically configured to process multi-value data for this to be applicable. Not all search providers support this behavior.

- `EqualTo(Int64)`. Constructs an `EqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThan(Int64)`. Constructs a `GreaterThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThanOrEqualTo(Int64)`. Constructs a `GreaterThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `IntegerPropertyExpression(String)`. Constructor.
- `LessThan(Int64)`. Constructs a `LessThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.

- `LessThanOrEqualTo(Int64)`. Constructs a `LessThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `NotEqualTo(Int64)`. Constructs a `NotEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.

Remarks

- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

IntegerValueExpression

8.50 and higher

Defines an expression representing an integer value.

Namespace

```
Ektron.Cms.Search.Expressions.IntegerValueExpression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node
- `IntegerValueExpression(Int64)`. Constructor.

KeywordExpression

8.50 and higher

Defines an expression representing a "keyword-search" operator.

Namespace

```
Ektron.Cms.Search.Expressions.KeywordExpression
```

Properties

- `Mode`. Gets or sets the mode for this keyword expression, which indicates whether individual terms are implicitly ANDed or ORed.
- `Phrase`. Gets or sets the StringValueExpression representing the keyword text of this expression.
- `Property`. Gets the property to which this KeywordExpression applies.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `KeywordExpression()`. Constructor.
- `KeywordExpression(PropertyExpression,String,KeywordMode)`. Constructor.
- `KeywordExpression(String,KeywordMode)`. Constructor.

Remarks

- `Solr`. The KeywordMode option is not supported if your search provider is Apache Solr. KeywordExpressions with multiple terms assume an implicit AND between terms.

LessThanExpression

8.50 and higher

Defines an expression representing a "less-than" operator.

Namespace

```
Ektron.Cms.Search.Expressions.LessThanExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `LessThanExpression()`. Constructor.
- `LessThanExpression(DatePropertyExpression,DateTime)`. Constructor.
- `LessThanExpression(DecimalPropertyExpression,Double)`. Constructor.
- `LessThanExpression(Expression,Expression)`. Constructor.
- `LessThanExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `LessThanExpression(StringPropertyExpression,String)`. Constructor.

LessThanOrEqualsExpression

8.50 and higher

Defines an expression representing a "less-than-or-equals" operator.

Namespace

```
Ektron.Cms.Search.Expressions.LessThanOrEqualsExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `LessThanOrEqualsExpression()`. Constructor.
- `LessThanOrEqualsExpression(DatePropertyExpression,DateTime)`. Constructor.
- `LessThanOrEqualsExpression(DecimalPropertyExpression,Double)`. Constructor.
- `LessThanOrEqualsExpression(Expression,Expression)`. Constructor.
- `LessThanOrEqualsExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `LessThanOrEqualsExpression(StringPropertyExpression,String)`. Constructor.

NotEqualsExpression

8.50 and higher

Defines an expression representing a "not-equals" operator.

Namespace

```
Ektron.Cms.Search.Expressions.NotEqualsExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `NotEqualsExpression()`. Constructor.
- `NotEqualsExpression(BooleanPropertyExpression,Boolean)`. Constructor.
- `NotEqualsExpression(DatePropertyExpression,DateTime)`. Constructor.
- `NotEqualsExpression(DecimalPropertyExpression,Double)`. Constructor.

- `NotEqualsExpression(Expression,Expression)`. Constructor.
- `NotEqualsExpression(IntegerPropertyExpression,Int64)`. Constructor.
- `NotEqualsExpression(StringPropertyExpression,String)`. Constructor.

NotExpression

8.50 and higher

Defines an expression representing a "not" operator.

Namespace

```
Ektron.Cms.Search.Expressions.NotExpression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `NotExpression(Expression)`. Constructor.

OrExpression

8.50 and higher

Defines an expression representing an "or" operator.

Namespace

```
Ektron.Cms.Search.Expressions.OrExpression
```

Properties

- `Left`. Gets the left branch of the binary expression tree.
- `Right`. Gets the right branch of the binary expression tree.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `OrExpression(Expression,Expression)`. Constructor.

PropertyExpression

8.50 and higher

The `PropertyExpression` class serves as a base for expressions identifying a specific searchable property.

Namespace

```
Ektron.Cms.Search.Expressions.PropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `And(Expression)`. Returns an AND expression of this expression and the specified right expression.

  NOTE: The AND expression is not support for expressions of type `PropertyExpression`.

- `CreateBooleanMultiValueProperty(String,PropertyCategory)`. Creates a `BooleanMultiValuePropertyExpression` for the specified searchable property.
- `CreateBooleanProperty(String)`. Creates a `BooleanPropertyExpression` for the specified searchable property.
- `CreateBooleanProperty(String,PropertyCategory)`. Creates a `BooleanPropertyExpression` for the specified searchable property.
- `CreateDateMultiValueProperty(String,PropertyCategory)`. Creates a `DateMultiValuePropertyExpression` for the specified searchable property.
- `CreateDateProperty(String)`. Creates a DatePropertyExpression for the specified searchable property.
- `CreateDateProperty(String,PropertyCategory)`. Creates a `DatePropertyExpression` for the specified searchable property.
- `CreateDecimalMultiValueProperty(String,PropertyCategory)`. Creates a `DecimalMultiValuePropertyExpression` for the specified searchable property.
- `CreateDecimalProperty(String)`. Creates a `DecimalPropertyExpression` for the specified searchable property.
- `CreateDecimalProperty(String,PropertyCategory)`. Creates a `DecimalPropertyExpression` for the specified searchable property.
- `CreateIntegerProperty(String)`. Creates a `IntegerPropertyExpression` for the specified searchable property.
- `CreateIntegerMultiValueProperty(String,PropertyCategory)`. Creates a `IntegerMultiValuePropertyExpression` for the specified searchable property.
- `CreateIntegerProperty(String,PropertyCategory)`. Creates a `IntegerPropertyExpression` for the specified searchable property.

- `CreateRankProperty()`. Creates a `RankPropertyExpression` for the default rank field.
- `CreateRankProperty(String)`. Creates a `RankProperty` expression for the default rank field with the specified rank ID.
- `CreateRankProperty(String,String)`. Creates a `RankProperty` expression for the specified rank field and rank ID.
- `CreateStringMultiValueProperty(String,PropertyCategory)`. Creates a `StringMultiValuePropertyExpression` for the specified searchable property.
- `CreateStringProperty(String)`. Creates a `StringPropertyExpression` for the specified searchable property.
- `CreateStringProperty(String,PropertyCategory)`. Creates a `StringPropertyExpression` for the specified searchable property.
- `Equals(Object)`. Returns true if this `PropertyExpression` instance is equal to the specified one.
- `GetHashCode()`. Gets the hash code for this `PropertyExpression` instance.
- `IsNull()`. Creates an 'IsNull' expression.
- `IsNotNull()`. Creates an 'IsNotNull' expression.
- `Or(Expression)`. Returns an OR expression of this expression and the specified right expression.

  NOTE: The OR expression is not support for expressions of type `PropertyExpression`.

- `PropertyExpression(String)`. Constructor.
- `ToString()`. Gets the string representation of this PropertyExpression instance.

Remarks

- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

RankPropertyExpression

8.60 and higher

Defines an expression representing a rank field in the index.

Namespace

```
Ektron.Cms.Search.Expressions.RankPropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `IsDefault`. Gets or sets a flag indicating whether the default ranking profile is applied.

- `Name`. Gets or sets the internal property name.
- `RankID`. Gets or sets the ID of the ranking profile to be applied.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `RankPropertyExpression()`. Constructor.
- `RankPropertyExpression(String)`. Constructor.
- `RankPropertyExpression(String,String)`. Constructor.

Remarks

- `FAST Search for Sharepoint 2010`. The `RankID` identifies the rank profile to be applied when calculating the relevance of documents matching your query.
- `Search Server 2010`. The `RankID` property is not supported for Microsoft Search Server.
- `Solr`. The `RankID` property is not supported for Apache Solr.

ScopeExpression

8.50 and higher

A `ScopeExpression` identifies a subset of a search index to be queried.

Namespace

```
Ektron.Cms.Search.Expressions.ScopeExpression
```

Properties

- `Default`. Gets a `ScopeExpression` identifying the default scope for the current site.

Methods

- `Accept(ExpressionVisitor)`. Accepts an expression visitor capable of translating this expression into a search query.
- `ScopeExpression()`. Implicit conversion of a single `ScopeExpression` to a list of ScopeExpressions.
- `ScopeExpression(String)`. Constructor.

StringMultiValuePropertyExpression

9.00 and higher

Defines an expression representing a string index field which may contain multiple values.

Namespace

```
Ektron.Cms.Search.Expressions.StringMultiValuePropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.
- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `Contains(String)`. Constructs a ContainsExpression using the current object as its left branch and the specified phrase as its right branch.
- `IsNotNull()`. Creates an 'IsNull' expression. (Not supported)
- `IsNull()`. Creates an 'IsNotNull' expression. (Not supported)
- `StringMultiValuePropertyExpression(String)`. Constructor.

Remarks

- `FAST Search for Sharepoint 2010`. Multi-value properties are not supported when your search provider is Microsoft FAST Search for SharePoint 2010.
- `Search Server 2010`. Multi-value properties are not supported when your search provider is Microsoft Search Server 2010.
- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

StringPropertyExpression

8.50 and higher

Defines an expression representing a string index field.

Namespace

```
Ektron.Cms.Search.Expressions.StringPropertyExpression
```

Properties

- `Category`. Gets or sets the CMS category by which this property is classified.
- `Name`. Gets or sets the internal property name.

- `ValueType`. Gets or sets the data type of the values that may be associated with this property.

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `AsMultiValue()`. Returns a reference to the multi-value form of this property expression, typically used to retrieve a collection of values from the index.

  NOTE: An index field must be specifically configured to process multi-value data for this to be applicable. Not all search providers support this behavior.

- `Contains(String)`. Constructs a `ContainsExpression` using the current object as its left branch and the specified phrase as its right branch.
- `Contains(String,WordForms)`. Constructs a `ContainsExpression` using the current object as its left branch and the specified phrase as its right branch.
- `EqualTo(String)`. Constructs an `EqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThan(String)`. Constructs a `GreaterThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `GreaterThanOrEqualTo(String)`. Constructs a `GreaterThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThan(String)`. Constructs a `LessThanExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `LessThanOrEqualTo(String)`. Constructs a `LessThanOrEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `NotEqualTo(String)`. Constructs a `NotEqualsExpression` using the current object as its left-branch, and the given parameter "value" as its right-branch.
- `StringPropertyExpression(String)`. Constructor.

Remarks

- `Solr`. Field names in Apache Solr are case sensitive. When constructing a `PropertyExpression` for a custom Solr index field, ensure that the proper casing is applied.

StringValueExpression

8.50 and higher

Defines an expression representing a string value.

Namespace

```
Ektron.Cms.Search.Expressions.StringValueExpression
```

Methods

- `Accept(ExpressionVisitor)`. Accepts a visitor to perform actions on this expression node.
- `StringValueExpression(String)`. Constructor.

Search Abstract Classes and Interfaces

ExpressionVisitor

8.60 and higher

The ExpressionVisitor class is an abstract base class defining objects that visit expression trees.

Namespace

```
Ektron.Cms.Search.ExpressionVisitor
```

Methods

- `Visit(AndExpression)`. Visits the specified AndExpression.
- `Visit(BooleanMultiValuePropertyExpression)`. Visits the specified BooleanMultiValuePropertyExpression.
- `Visit(BooleanPropertyExpression)`. Visits the specified BooleanPropertyExpression.
- `Visit(BooleanValueExpression)`. Visits the specified BooleanValueExpression.
- `Visit(ContainsExpression)`. Visits the specified ContainsExpression.
- `Visit(DateMultiValuePropertyExpression)`. Visits the specified DateMultiValuePropertyExpression.
- `Visit(DatePropertyExpression)`. Visits the specified DatePropertyExpression.
- `Visit(DateValueExpression)`. Visits the specified DateValueExpression.
- `Visit(DecimalMultiValuePropertyExpression)`. Visits the specified DecimalMultiValuePropertyExpression.
- `Visit(DecimalPropertyExpression)`. Visits the specified DecimalPropertyExpression.
- `Visit(DecimalValueExpression)`. Visits the specified DecimalValueExpression.

- `Visit(DefaultScopeExpression)`. Visits the specified DefaultScopeExpression.
- `Visit(EqualsExpression)`. Visits the specified EqualsExpression.
- `Visit(Expression)`. Visits the specified Expression.
- `Visit(GreaterThanExpression)`. Visits the specified GreaterThanExpression.
- `Visit(GreaterThanOrEqualsExpression)`. Visits the specified GreaterThanOrEqualsExpression.
- `Visit(IntegerMultiValuePropertyExpression)`. Visits the specified IntegerMultiValuePropertyExpression.
- `Visit(IntegerPropertyExpression)`. Visits the specified IntegerPropertyExpression.
- `Visit(IntegerValueExpression)`. Visits the specified IntegerValueExpression.
- `Visit(IsNotNullExpression)`. Visits the specified IsNotNullExpression.
- `Visit(IsNullExpression)`. Visits the specified IsNullExpression.
- `Visit(KeywordExpression)`. Visits the specified KeywordExpression.
- `Visit(LessThanExpression)`. Visits the specified LessThanExpression.
- `Visit(LessThanOrEqualsExpression)`. Visits the specified LessThanOrEqualsExpression.
- `Visit(NotEqualsExpression)`. Visits the specified NotEqualsExpression.
- `Visit(NotExpression)`. Visits the specified NotExpression.
- `Visit(OrExpression)`. Visits the specified OrExpression.
- `Visit(PropertyExpression)`. Visits the specified PropertyExpression.
- `Visit(QuotedStringValueExpression)`. Visits the specified QuotedStringValueExpression.
- `Visit(ScopeExpression)`. Visits the specified ScopeExpression.
- `Visit(StringMultiValuePropertyExpression)`. Visits the specified StringMultiValuePropertyExpression.
- `Visit(StringPropertyExpression)`. Visits the specified StringPropertyExpression.
- `Visit(StringValueExpression)`. Visits the specified StringValueExpression.

IAuthenticationHandler

8.50 and higher

The IAuthenticationHandler interface describes a component capable of applying the appropriate permission data to an outgoing search query.

Namespace

```
Ektron.Cms.Search.IAuthenticationHandler
```

Methods

- `Handle(AdministratorPermission)`. Handles the specified permission data, applying it to an outgoing search query. The permission data indicates that the query should execute as a CMS administrator.
- `Handle(CurrentUserPermission)`. Handles the specified permission data, applying it to an outgoing search query. The permission data indicates that the query should execute as the current CMS user.
- `Handle(ManualUserPermission)`. Handles the specified permission data, applying it to an outgoing search query. The permission data indicates that the query should execute as a specific CMS user.
- `Handle(Permission)`. Handles the specified permission data, applying it to an outgoing search query.

ICrawler

8.50 and higher

The ICrawler interface describes a components capable of managing initiation of indexing activities for relevant CMS events.

Namespace

```
Ektron.Cms.Search.ICrawler
```

Methods

- `AddAlias(AliasData)`. Signals the crawler to handle an add manual alias event.
- `AddAliasRule(AliasRuleData)`. Signals the crawler to handle an add auto alias event.
- `AddAutoAlias(UrlAliasAutoData)`. Signals the crawler to handle an add alias event.
- `AddBlogComment(BlogComment)`. Signals the crawler to handle an add blog comment event.
- `AddColleague(Int64,Int64)`. Signals the crawler to handle an add colleague event.
- `AddCommunityAlias(UrlAliasCommunityData)`. Signals the crawler to handle an add alias event.
- `AddContent(ContentData)`. Signals the crawler to handle an add content event.
- `AddCustomProperty(CustomPropertyData)`. Signals the crawler to handle a custom property add event.
- `AddCustomPropertyObject(CustomPropertyObjectData)`. Signals the crawler to handle a custom property object add event.

- `AddDiscussionReply(TaskData)`. Signals the crawler to handle an add discussion reply event.
- `AddDiscussionTopic(DiscussionTopic)`. Signals the crawler to handle an add discussion topic event.
- `AddFolder(FolderData)`. Signals the crawler to handle an add folder event.
- `AddGroup(CommunityGroupData)`. Signals the crawler to handle an add Group event.
- `AddLibraryItem(LibraryData)`. Signals the crawler to handle an add library item event.
- `AddManualAlias(UrlAliasManualData)`. Signals the crawler to handle an add alias event.
- `AddPermission(PermissionData)`. Signals the crawler to handle the addition of a permission.
- `AddProperty(MetaTypeBaseData)`. Signals the crawler to handle an add metadata event.
- `AddRegExAlias(UrlAliasRegExData)`. Signals the crawler to handle an add alias event.
- `AddTaxonomyItem(TaxonomyBaseData)`. Signals the crawler to handle an add taxonomy item event.
- `AddTemplate(TemplateData)`. Signals the crawler to handle the addition of a template.
- `AddUser(UserData)`. Signals the crawler to handle an add user event.
- `AddUserProperty(UserCustomPropertyData)`. Signals the crawler to handle a user property add event.
- `AddXmlConfiguration(XmlConfigData)`. Signals the crawler to handle an add XML configuration event.
- `CopyFolder(Int64,Int64)`. Signals the crawler to handle a copy folder event.
- `DeleteAlias(AliasData)`. Signals the crawler to handle a delete manual alias event.
- `DeleteAliasRule(AliasRuleData)`. Signals the crawler to handle a delete auto alias event.
- `DeleteAutoAlias(Int64)`. Signals the crawler to handle an delete alias event.
- `DeleteCatalogEntry(Int64)`. Signals the crawler to handle a delete catalog entry event.
- `DeleteColleague(Int64,Int64)`. Signals the crawler to handle an delete colleague event.
- `DeleteCommunityAlias(Int64)`. Signals the crawler to handle an delete alias event.
- `DeleteContent(Int64)`. Signals the crawler to handle an delete content event.
- `DeleteCustomProperty(Int64,Int32)`. Signals the crawler to handle a custom property delete event.

- `DeleteCustomPropertyObject (Int64,Int32,CustomPropertyObjectType,Int64)`. Signals the crawler to handle a custom property object delete event.
- `DeleteFolder(Int64)`. Signals the crawler to handle an delete folder event.
- `DeleteGroup(Int64)`. Signals the crawler to handle a delete group event.
- `DeleteLibraryItem(Int64)`. Signals the crawler to handle a delete library item event.
- `DeleteManualAlias(Int64)`. Signals the crawler to handle an delete alias event.
- `DeleteObjectTag(Int64,Int64,CMSObjectTypes,Int64)`. Signals the crawler to handle a tag delete event.
- `DeletePermission(PermissionData)`. Signals the crawler to handle the deletion of a permission.
- `DeleteProperty(Int64)`. Signals the crawler to handle an delete metadata event.
- `DeleteRegExAlias(Int64)`. Signals the crawler to handle an delete alias event.
- `DeleteTaxonomyItem(Int64)`. Signals the crawler to handle an delete taxonomy item event.
- `DeleteTemplate(Int64)`. Signals the crawler to handle the deletion of a template.
- `DeleteUser(Int64)`. Signals the crawler to handle a delete user event.
- `DeleteUserProperty(Int64)`. Signals the crawler to handle a user property delete event.
- `DeleteWebEvent(Int64)`. Signals the crawler to handle an delete Web event.
- `DeleteXmlConfiguration(Int64)`. Signals the crawler to handle an delete XML configuration event.
- `DisableAlias(AliasData)`. Signals the crawler to handle a disable manual alias event.
- `DisableAliasRule(AliasRuleData)`. Signals the crawler to handle a disable auto alias event.
- `EnableAlias(AliasData)`. Signals the crawler to handle an enable alias event.
- `EnableAliasRule(AliasRuleData)`. Signals the crawler to handle a enable auto alias event.
- `MoveFolder(Int64)`. Signals the crawler to handle a move folder event.
- `PublishCatalogEntry(Int64)`. Signals the crawler to handle a publish catalog entry event.
- `PublishWebEvent(WebEventData)`. Signals the crawler to handle an publish Web event.
- `StartFullCrawl()`. Requests a full crawl from the associated indexing service.
- `StartFullCrawl(CrawlType)`. Requests a full crawl from the associated indexing service.

- `StartFullCrawl(CrawlType,Boolean)`. Requests a full crawl from the associated indexing service with an option whether or not to respect crawl filters from CMS database.
- `StartIncrementalCrawl()`. Requests an incremental crawl from the associated indexing service.
- `StartIncrementalCrawl(Boolean)`. Requests an incremental crawl from the associated indexing service.
- `StartIncrementalCrawl(Boolean,CrawlType)`. Requests an incremental crawl from the associated indexing service.
- `StartIncrementalCrawl(Boolean,CrawlType,Boolean)`. Requests an incremental crawl from the associated indexing service with an option whether or not to respect crawl filters from CMS database.
- `StartIncrementalCrawl(CrawlType)`. Requests an incremental crawl from the associated indexing service.
- `TagObject(TagAssignmentData)`. Signals the crawler to handle a tag assignment event.
- `UpdateAlias(AliasData)`. Signals the crawler to handle an update manual alias event.
- `UpdateAliasRule(AliasRuleData)`. Signals the crawler to handle an update auto alias event.
- `UpdateAliasSetting(String,Object)`. Signals the crawler to handle a URL aliasing settings update.
- `UpdateAutoAlias(UrlAliasAutoData)`. Signals the crawler to handle an update alias event.
- `UpdateCommunityAlias(UrlAliasCommunityData)`. Signals the crawler to handle an update alias event.
- `UpdateContent(ContentData)`. Signals the crawler to handle an update content event.
- `UpdateCustomProperty(CustomPropertyData)`. Signals the crawler to handle a custom property update event.
- `UpdateCustomPropertyObject(CustomPropertyObjectData)`. Signals the crawler to handle a custom property object update event.
- `UpdateDiscussionTopic(DiscussionTopic)`. Signals the crawler to handle an update discussion topic event.
- `UpdateFolder(FolderData)`. Signals the crawler to handle an update folder event.
- `UpdateGroup(CommunityGroupData)`. Signals the crawler to handle an update group event.
- `UpdateItemInheritance(Int64,String,Boolean)`. Signals the crawler to handle the update of the permission inheritance setting for a particular item.
- `UpdateLibraryItem(LibraryData)`. Signals the crawler to handle an update library item event.

- `UpdateManualAlias(UrlAliasManualData)`. Signals the crawler to handle an update alias event.
- `UpdatePermission(PermissionData)`. Signals the crawler to handle the update of a permission.
- `UpdatePrivateSetting(Int64,String,Boolean)`. Signals the crawler to handle the update of the permission privacy setting for a particular item.
- `UpdateProperty(MetaTypeBaseData)`. Signals the crawler to handle an update metadata event.
- `UpdateRegExAlias(UrlAliasRegExData)`. Signals the crawler to handle an update alias event.
- `UpdateTaxonomyItem(TaxonomyBaseData)`. Signals the crawler to handle an update taxonomy item event.
- `UpdateTemplate(TemplateData)`. Signals the crawler to handle the update of a template.
- `UpdateUser(UserData)`. Signals the crawler to handle an update user event.
- `UpdateUserProperty(UserCustomPropertyData)`. Signals the crawler to handle a user property update event.
- `UpdateXmlConfiguration(XmlConfigData)`. Signals the crawler to handle an update XML configuration event.
- `UpdateXmlIndex(XmlConfigData)`. Signals the crawler to handle an update to XML Index configuration event (saving the index fields on second screen of Smart Form creation).

IIntegratedSearchMapping

8.50 and higher

The IntegratedSearchMapping interface describes a business object which exposes functionality supporting the creation and management of integrated search mappings.

Namespace

```
Ektron.Cms.Search.IIntegratedSearchMapping
```

Methods

- `Add(IntegratedSearchMappingData)`. Adds the specified integrated search mapping.
- `Delete(Guid)`. Deletes the specified integrated search mapping from the database.
- `Get()`. Gets a collection of all integrated search mappings.
- `Get(Guid)`. Gets the specified integrated search mapping.
- `Update(IntegratedSearchMappingData)`. Updates the specified integrated search mapping.

IPropertyNameResolver

8.50 and higher

The IPropertyNameResolver interface describes a component capable of transforming an internal CMS property name to the name of the corresponding index field.

Namespace

```
Ektron.Cms.Search.IPropertyNameResolver
```

Methods

- `Resolve(String,PropertyCategory,PropertyType)`. Translates the specified CMS property name to the name of the corresponding index field (as its known the underlying search provider).

ISearchManager

8.50 and higher

The ISearchManager interface defines a component capable of submitting queries for CMS data (content, users, groups, and so on) and returning the relevant results.

Namespace

```
Ektron.Cms.Search.ISearchManager
```

Methods

- `Search(AdvancedSearchCriteria)`. Submits a query according to the specified criteria.
- `Search(KeywordSearchCriteria)`. Submits a query according to the specified criteria.

ISearchProvider

8.50 and higher

The ISearchProvider interface describes a component that is capable of communicating with a specific search engine. This includes the translation of CMS search criteria into a syntax supported by that engine, issuing of the query, and the processing of any response data.

Namespace

```
Ektron.Cms.Search.ISearchProvider
```

Methods

- `Search(AdvancedSearchCriteria)`. Executes a narrow, expression-based query using the specified criteria.
- `Search(KeywordSearchCriteria)`. Executes a keyword-based query using the specified criteria.

ISearchSettings

8.50 and higher

The ISearchSettings interface describes a component capable of updating and retrieving the configuration details for the search feature.

Namespace

```
Ektron.Cms.Search.ISearchSettings
```

Methods

- `GetItem()`. Gets the search settings for the current site.

ISuggestedResults

8.50 and higher

The ISuggestedResults interface describes a component providing administrative capabilities for suggested search result data.

Namespace

```
Ektron.Cms.Search.ISuggestedResults
```

Methods

- `Add(SuggestedResultSet)`. Adds the specified suggested result set.
- `Delete(Guid)`. Deletes the suggested result identified by the ID.
- `GetItem(Guid)`. Gets the suggested result set identified by the specified ID.
- `GetItem(String)`. Gets the suggested result set containing the specified search phrase.
- `GetList()`. Gets a collection of suggested result sets from the configured search provider.
- `Update(SuggestedResultSet)`. Updates the specified suggested result set.

ISynonyms

8.50 and higher

The ISynonyms interface describes a class providing access to search synonym sets.

Namespace

```
Ektron.Cms.Search.ISynonyms
```

Methods

- `Add(SynonymSet)`. Adds the specified synonym set.
- `Add(List<SynonymSet>)`. Adds the specified synonym sets.
- `Delete(Guid,Int32)`. Deletes the specified synonym set.
- `GetItem(Guid)`. Gets a synonym set.
- `GetList(Int32)`. Gets a collection of synonym sets for the specified language.
- `Update(List<SynonymSet>)`. Updates the specified synonym sets.
- `Update(SynonymSet)`. Updates the specified synonym set.

Settings

8.50 and higher

The Settings manager category manages CMS settings and has the following classes:

- *CmsMessageManager* on page 1424. Manages messages in the Ektron CMS.
- *CmsMessageTypeManager* on page 1442. Manages message types in the Ektron CMS.
- *CustomPropertyManager* on page 1456. Manages user-specified properties to create custom fields.
- *DXH* on page 1469. Sub-category of Settings. 9.00 and higher
  - *DXHUserConnectionManager* on page 1469. Manages connections between the Digital Experience Hub (DXH) and other applications.
- *Notifications* on page 1479. Sub-category of Settings.
  - *NotificationAgentSettingManager* on page 1480. Manages notification agents.
  - *NotificationPreferenceManager* on page 1498. Manages preferences for notification agents.
  - *NotificationPublishPreferenceManager* on page 1523. Manages preferences for notification agents that can be published.
  - *UserNotificationSettingManager* on page 1535. Manages user-specified notifications.
- *PermissionManager* on page 1552. Manages user permissions.
- *SmartformConfigurationManager* on page 1577. Manages Smart Form configurations.
- *TaskCategoryManager* on page 1600. Manages task categories.
- *TaskCommentManager* on page 1593. Manages task comments.
- *TaskManager* on page 1612. Manages tasks.
- *TaxonomyCustomPropertyManager* on page 1631. Manages user-specified taxonomy properties.
- *UrlAliasing* on page 1649. Sub-category of Settings.
  - *AliasManager* on page 1650. Manages aliases.
  - *AliasRuleManager* on page 1673. Manages alias rules.
  - *AliasSettingManager* on page 1704. Manages alias settings.
  - *AutoAliasManager* on page 1736. Manages automatic aliases, which lets you assign an alias to several content items at once.
  - *CommonAliasManager* on page 1755. Gets alias and target data that is common to any alias.

- *CommunityAliasManager* on page 1759. Manages aliases that apply to communities.
- *ManualAliasManager* on page 1776. Manages manual aliases.
- *RedirectManager* on page 1792. Manages URL redirect addresses.
- *RegExAliasManager* on page 1812. Manages regular expressions that replace URLs that cannot be read.

CmsMessageManager

8.50 and higher

The CmsMessageManager class manages messages in the Ektron CMS.

Namespace

```
Ektron.Cms.Framework.Settings.CmsMessageManager
```

Constructors

- `CmsMessageManager()`
- `CmsMessageManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MessageService`. Gets instance to ICmsMessage.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1427
- *GetDefaultItemByType* on page 1428
- *GetItem* on page 1430
- *GetItemCollection* on page 1432
- *Update* on page 1437

Add

```
Add(Ektron.Cms.Messaging.CmsMessageData)
```

Adds a message based on information in an CmsMessageData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- Is Default
- * Message Type ID
- * Subject
- * HTML Body

Parameters

- `message`. The CmsMessageData object to add.

Returns

Returns the custom CmsData object added.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a message (CmsMessageData object) from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of the message to delete

Remarks

Validate the item with `GetItem()` before deleting it.

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetDefaultItemByType

```
GetDefaultItemByType(System.Int64)
```

Retrieves the default message for a message type in the CMS. All available languages of the message are returned as part of the CmsMessageData object collection.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `messageTypeId`. The ID of the message type to retrieve the default message for.

            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(CmsMessageCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- CMS Message Property
- * Object Value

Parameters

- `criteria`. CmsMessageCriteria used to retrieve messages.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.CmsMessageData)
```

Updates an existing CmsMessageData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Title
- Message Type ID
- Subject
- HTML Body

Parameters

- `message`. The CmsMessageData object to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the CmsMessage item with `GetItem()` before you update the properties. Then, call `Update` with your modified CmsMessageData object.

NOTE: You cannot change all properties after the initial Add event, such as the CmsMessageData.Type.

Data Classes

CmsMessageCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Messaging
```

Constructors

- `CmsMessageCriteria()`

  ```
  public CmsMessageCriteria()
  ```

- `CmsMessageCriteria(Ektron.Cms.Messaging.CmsMessageProperty, EkEnumeration.OrderByDirection)`

  ```
  public CmsMessageCriteria(Ektron.Cms.Messaging.CmsMessageProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CmsMessageProperty` are:

  - HtmlBody
  - Id
  - IsDefault

- LanguageId
- MessageTypeId
- MessageTypeName
- MessageTypeScope
- SiteId
- Subject
- TextBody
- Title

CmsMessageData

Namespace

```
Ektron.Cms.Messaging
```

Properties

- `CmsMessageData()`

```
public CmsMessageData()
```

- `CmsMessageData(string, string, string, string, int, long, bool)`

```
public CmsMessageData(string title, string subject,
  string htmlBody, string textBody, int languageId,
  long messageTypeId, bool isDefault)
```

- `HtmlBody`. Gets or sets the Html Body of the Message. Depending on the delivery mechanism of the message, either the TextBody or HtmlBody may be used.

```
public string HtmlBody { set; get; }
```

- `IsDefaultMessage`. Gets or sets the IsDefault flag for this message. If true, this message is the defualt used for the MessageType.

```
public bool IsDefaultMessage { set; get; }
```

- `MessageType`. Gets or sets the the message type of this message.

```
public Ektron.Cms.Messaging.CmsMessageTypeData
  MessageType { set; get; }
```

- `SiteId`. Gets or sets the Id of the site that the message is associated with.

```
public long SiteId { set; get; }
```

- `Subject`. Gets or sets the Subject of the Message.

```
public string Subject { set; get; }
```

- `TextBody`. Gets or sets the Html Body of the Message. Depending on the delivery mechanism of the message, either the TextBody or HtmlBody may be used.

```
public string TextBody { set; get; }
```

- `Title`. Gets or Sets the Title of the Message.

```
public string Title { set; get; }
```

- `Ektron.Cms.Messaging.CmsMessageData.Validate()`. Validates that the data object is in a valid state for persisting. It returns a collection of ValidationResult messages if the object is not valid.

```
public override ValidationResults Validate()
```

CmsMessageTypeManager

8.50 and higher

The CmsMessageTypeManager class manages message types in the Ektron CMS.

Namespace

```
Ektron.Cms.Framework.Settings.CmsMessageTypeManager
```

Constructors

- `CmsMessageTypeManager()`
- `CmsMessageTypeManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `MessageTypeService`. Gets instance to ICmsMessageType.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Messaging.CmsMessageTypeData)
```

Adds a message type based on information in a CmsMessageTypeData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Scope

Parameters

- `messageType`. The CmsMessageTypeData object to add.

Returns

Returns the custom CmsData object added.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxNameLabel" AssociatedControlID="uxName" CssClass="span-3

            {
                 Name = uxName.Text ,
                 Scope = uxScope.Text
            };

            cmsMessageTypeManager.Add(cmsMessageTypeData);

            MessageUtilities.UpdateMessage(uxMessage, "Message Type added with Id " +
cmsMessageTypeData.Id, Message.DisplayModes.Success);

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a message type (CmsMessageTypeData object) from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the message to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

.aspx code snippet

```

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(CmsMessageTypeCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- CMS Message Type Property
- * Object Value

Parameters

- `criteria`. CmsMessageTypeCriteria used to retrieve message types.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.CmsMessageTypeData)
```

Updates an existing CmsMessageTypeData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Name
- Scope

Parameters

- `messageType`. The CmsMessageTypeData object to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the CmsMessageType item with `GetItem()` before you update the properties. Then, call `Update` with your modified CmsMessageTypeData object.

NOTE: You cannot change all properties after the initial Add event, such as the CmsMessageTypeData.Type.

.aspx code snippet

    }
```

Data Classes

CmsMessageTypeCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Messaging
```

Constructors

- `CmsMessageTypeCriteria()`

  ```
  public CmsMessageTypeCriteria()
  ```

- `CmsMessageTypeCriteria (Ektron.Cms.Messaging.CmsMessageTypeProperty, EkEnumeration.OrderByDirection)`

  ```
  public CmsMessageTypeCriteria(Ektron.Cms.Messaging.CmsMessageTypeProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `CmsMessageTypeProperty` are:

  - Id
  - Name
  - Scope

CmsMessageTypeData

Namespace

```
Ektron.Cms.Messaging
```

Properties

- `Id`

```
public long Id { set; get; }
```

- `Name`. Gets or sets the name of the message type.

```
public string Name { set; get; }
```

- `Scope`. Gets or sets the scope of the message type.

```
public string Scope { set; get; }
```

- `Validate()`. Validates that the data object is in a valid state for persisting and returns a collection of ValidationResult messages if the object is not valid.

```
public override ValidationResults Validate()
```

CustomPropertyManager

8.50 and higher

The CustomPropertyManager class manages user-specified properties to create custom fields. See Managing Users and User Groups in the Ektron Reference for information about custom user properties.

Namespace

```
Ektron.Cms.Framework.Settings.CustomPropertyManager
```

Constructors

- `CustomPropertyManager()`
- `CustomPropertyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `CustomPropertyManagerService`. Returns an instance of the business objects CustomPropertyManager service.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Messaging.UserCustomPropertyData)
```

Adds a UserCustomProperty, with details from the supplied UserCustomPropertyData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Input Type
- * Type
- * Validation Type
- Message

Parameters

- `UCPData`

Returns

Returns the custom CmsData object added.

    }
```

Delete

```
Delete(System.Int64)
```

Deletes a UserCustomPropertyData object from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The identifier of the UserCustomPropertyData object to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

    }
```

GetList

```
GetList(CustomPropertyCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- User Customer Property
- * Object Value

Parameters

- `criteria`. CustomPropertyCriteria Used to specify, or filter, the UserCustomPropertyData object to return.

Returns

A list of UserCustomPropertyData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

.aspx code snippet

```

        }
    }
```

Update

```
Update(Ektron.Cms.UserCustomPropertyData)
```

Updates a UserCustomProperty, with details from the supplied UserCustomPropertyData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Name
- Input Type

- Validation Type
- Message

Parameters

- `UCPData`

Returns

Returns the custom CmsData object updated.

Remarks

Validate the object with `GetItem()` before you update the properties. Then, call `Update` with your modified UserCustomPropertyData object.

NOTE: You cannot change all properties after the initial Add event, such as the UserPermissionData.Type.

DXH

8.60 and higher

The DXH manager category is a sub-category of Settings and manages connections between the Digital Experience Hub (DXH) and other applications. It has 1 class.

- *DXHUserConnectionManager* below. Manages connections between the Digital Experience Hub (DXH) and other applications.

DXHUserConnectionManager

The DXHUserConnectionManager class manages connections between the Digital Experience Hub (DXH) and other applications.

8.60 and higher

Namespace

```
Ektron.Cms.Framework.Settings.DxH.DxHUserConnectionManager
```

Constructors

- `DxHUserConnectionManager()`
- `DxHUserConnectionManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `DxHUserConnectionDataService`. Gets instance to DxHUserConnectionManager.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on the facing page
- *GetItem* on page 1473
- *GetList* on page 1474
- *Update* on page 1477

Add

```
Add(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectData)
```

Adds a DxHUserConnectionData object with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * DXH Connection Code

Parameters

- `data`. DxHUserConnectionData object.

Returns

Returns added DxHUserConnectionData object.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            DxHConnectionManager dxhconnectionManager = new DxHConnectionManager();

            if (uxAdapterName.Text.Trim() == "" || uxConnectionName.Text.Trim() == "")
            {
                MessageUtilities.UpdateMessage(uxMessage, "Enter the required fields",
Message.DisplayModes.Error);
            }
            else
            {

                DxHConnectionData dxhConnectionData = new DxHConnectionData()
                {
                    AdapterName = uxAdapterName.Text,
                    ConnectionName = uxConnectionName.Text,
                    EndPoint = uxEndPoint.Text,

                };
                dxhconnectionManager.Add(dxhConnectionData);
                MessageUtilities.UpdateMessage(uxMessage, "DxConnection property added
with Id " + dxhConnectionData.Id, Message.DisplayModes.Success);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a DxHUserConnectionData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of the DxHUserConnectionData to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

        }
    }
```

GetList

```
GetList(Ektron.Cms.Common.Criteria)
```

Retrieves a list of DxHUserConnectionData objects based upon the supplied criteria.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * DXH User Connection Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve the DxHUserConnectionData.

Returns

Returns a list of DxHUserConnectionData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectData)
```

Updates the supplied DxHUserConnectionData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Redirect ID
- Redirect Code
- Original URL
- New URL
- Active

Parameters

- `data`. The DxHUserConnectionData object to update.

Returns

Updated the DxHUserConnectionData object.

Remarks

Validate the redirect item with `GetItem()` before you update the properties. Then, call `Update` with your modified DxHUserConnectionData object.

NOTE: You cannot change all properties after the initial Add event, such as the DxHUserConnectionData.Type.

.aspx.cs code-behind method

Data Classes

DxHUserConnectionData

Namespace

```
Ektron.Cms.Settings.DxH
```

Properties

- `ConnectionName`. Gets or Sets the ConnectionName for DxHUserConnectionData object.

  ```
  public string ConnectionName { set; get; }
  ```

- `ConnectorName`. Gets or Sets the Connector Name for DxHUserConnectionData object.

  ```
  public string ConnectorName { set; get; }
  ```

- `ConnectorObjectName`. Gets or Sets the Connector Object Name for DxHUserConnectionData object.

  ```
  public string ConnectorObjectName { set; get; }
  ```

- `ExternalUserKey`. Gets or Sets the Id for the user in the external system.

  ```
  public string ExternalUserKey { set; get; }
  ```

- `Id`. Gets or Sets the Id for DxHUserConnectionData object.

  ```
  public long Id { set; get; }
  ```

- `VisitorId`Gets or Sets the VisitorId for DxHUserConnectionData object.

  ```
  public string VisitorId { set; get; }
  ```

Notifications

8.50 and higher

The Notifications manager category is a sub-category of Settings and manages notifications with the following classes:

- *NotificationAgentSettingManager* on the next page. Manages notification agents.
- *NotificationPreferenceManager* on page 1498. Manages preferences for notification agents.
- *NotificationPublishPreferenceManager* on page 1523. Manages preferences for notification agents that can be published.
- *UserNotificationSettingManager* on page 1535. Manages user-specified notifications.

NotificationAgentSettingManager

8.50 and higher

The NotificationAgentSettingManager class manages notification agents.

A notification agent is a plug-able component that sends notification messages. Each Agent is responsible for sending notifications to users when CMS activity occurs. After a Notification Agent is created and registered, users can set up notification preferences that use it.

For information about notifications, see Sending Notifications to a Community in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Settings.Notifications.NotificationAgentSettingManager
```

Constructors

- `NotificationAgentSettingManager()`
- `NotificationAgentSettingManager(ApiAccessMode)`

Properties

- `AgentSettingService`. Notification Agent Service
- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetRegisteredAgentList* on page 1492
- *Update* on page 1492

Add

```
Add(Ektron.Cms.Notifications.NotificationAgentData)
```

Adds a notification agent with details from the supplied NotificationAgentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Description
- Enable Agent
- * Type Name

Parameters

- `agentData`. Agent settings to save.

Returns

Returns the custom CmsData object added.

Delete

```
Delete(System.Int64)
```

Deletes a notification agent from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Notification Agent ID

Parameters

- `id`. ID of agent to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

        }
    }
```

GetItem

```
GetItem(Ektron.Cms.NotificationAgentData)
```

Retrieves the properties of a specific NotificationAgentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Notification Agent ID

Parameters

- `id`. ID of agent to retrieve settings for.

```

GetRegisteredAgentList

```
GetRegisteredAgentList
```

Retrieves a list of the notification agents registered in `web.config`.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            NotificationAgentSettingManager notificationAgentSettingManager = new
NotificationAgentSettingManager();
            if (uxAgentList.Checked)
            {
                List<NotificationAgent> NotificationAgentList =
notificationAgentSettingManager.GetRegisteredAgentList();
                uxNotificationAgentListView.Visible = true;
                uxNotificationAgentListView.DataSource = NotificationAgentList;
                uxNotificationAgentListView.DataBind();
            }
            else
            {
                MessageUtilities.UpdateMessage(uxMessage,  "Please Check the 'Get
Notification Agent List' CheckBox and Try again", Message.DisplayModes.Error);
            }

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.NotificationAgentData)
```

Updates an existing NotificationAgentData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Notification Agent ID
- Name
- Description
- Enable Agent
- Type Name

Parameters

- `agentData`. Agent settings to save.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the NotificationAgent item with `GetItem()` before you update the properties. Then, call `Update` with your modified NotificationAgentData object.

NOTE: You cannot change all properties after the initial Add event, such as the NotificationAgentData.Type.

Data Classes

NotificationAgentCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Notifications
```

Constructors

- `NotificationAgentCriteria()`

  ```
  public NotificationAgentCriteria()
  ```

- `NotificationAgentCriteria (Ektron.Cms.Notifications.NotificationAgentProperty, EkEnumeration.OrderByDirection)`

  ```
  public NotificationAgentCriteria(Ektron.Cms.Notifications.NotificationAgentProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `NotificationAgentProperty` are:

  - Description
  - Id
  - IsEnabled
  - Name
  - TypeName

NotificationAgentData

Namespace

```
Ektron.Cms.Notificiations
```

Properties

- `NotificationAgentData()`

  ```
  public NotificationAgentData()
  ```

- `NotificationAgentData(long, string, string, string, bool)`

  ```
  public NotificationAgentData(long id, string name,
    string description, string typeName, bool isEnabled)
  ```

- `Validate()`. Validates that the data object is valid for saving. Any errors are returns as ValidationResults.

  ```
  public ValidationResults Validate()
  ```

- `Description`. Gets or sets the description of the agent.

  ```
  public string Description { set; get; }
  ```

- `Id`. Get or sets the ID of the notification agent.

  ```
  public long Id { set; get; }
  ```

- `IsEnabled`. Gets or sets the IsEnabled flag on the agent.

  ```
  public bool IsEnabled { set; get; }
  ```

- `Name`. Gets or sets the Name of the agent.

  ```
  public string Name { set; get; }
  ```

- `TypeName`. Gets or sets the fully qualified name of the agent type.

```
public string TypeName { set; get; }
```

NotificationPreferenceManager

8.50 and higher

The NotificationPreferenceManager class manages preferences for notification agents.

A notification agent is a plug-able component that sends notification messages. Each Agent is responsible for sending notifications to users when CMS activity occurs. Once a Notification Agent is created and registered, users can set up notification preferences that use it.

For information about notifications, see Sending Notifications to a Community in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Settings.Notifications.NotificationPreferenceManager
```

Constructors

- `NotificationPreferenceManager()`
- `NotificationPreferenceManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `NotificationPreferenceService`. Notification preference service
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetUserNotificationListForActivity* on page 1510
- *SaveUserPreferences* on page 1513
- *Update* on page 1517

Add

```
Add(Ektron.Cms.Notifications.NotificationPreferenceData)
```

Adds a notification agent with details from the supplied NotificationPreferenceData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Agent ID
- * Activity Type ID
- Object ID

Parameters

- `preferenceData`. Preference data to save.

Returns

Returns the custom CmsData object added.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a notification preference from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Notification Preference ID

Parameters

- `id`. ID of notification preference to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

        }
    }
```

GetDefaultPreferenceList

```
GetDefaultPreferenceList
(Ektron.Cms.Notifications.NotificationPreferenceCriteria)
```

Retrieves a list of default notification preferences based on the supplied criteria.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Notification Preference Property
- * Object Value

Parameters

- `criteria`. NotificationPreferenceCriteria used to determine which default preferences to return.

```

GetUserNotificationListForActivity

```
GetUserNotificationListForActivity(Ektron.Cms.Activity.ActivityData,
Ektron.Cms.PagingInfo)
```

Retrieves a list of users and their notification settings for a given activity occurrence.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Activity ID

Parameters

- `activity`. Activity definition to retrieve notifications for.
- `paging`. Paging information for the retrieval.

```

SaveUserPreferences

```
SaveUserPreferences(System.Collections.Generic.List)
```

Saves a set of notification preferences for a user. Preferences marked as added are added and those marked as deleted are removed.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * List of Users
- Notify me about these colleague activities (SMS, activity stream, and Email checklists)

Parameters

- `preferenceList`. Preference data to save.

```

Update

```
Update(Ektron.Cms.NotificationAgentData)
```

Updates an existing notification preference item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Notification Preference ID
- User ID
- Agent ID
- Activity Type ID
- Object ID

Parameters

- `preferenceData`. Preference data to save.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the notification preference item with `GetItem()` before you update the properties. Then, call `Update` with your modified NotificationPreferenceData object.

NOTE: You cannot change all properties after the initial Add event, such as the NotificationPreferenceData.Type.

```

Data Classes

NotificationPreferenceCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Notifications
```

Constructors

- `NotificationPreferenceCriteria()`

  ```
  public NotificationPreferenceCriteria()
  ```

- `NotificationPreferenceCriteria (Ektron.Cms.Notifications.NotificationPreferenceProperty, EkEnumeration.OrderByDirection)`

```
public NotificationPreferenceCriteria
(Ektron.Cms.Notifications.NotificationPreferenceProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `NotificationPreferenceProperty` are:

- ActionSource
- ActionSourceId
- ActivityActionType
- ActivityTypeId
- AgentId
- Id
- ObjectId
- ObjectType
- UserId

NotificationPreferenceData

Namespace

```
Ektron.Cms.Notifications
```

Properties

- `ActionSourceId`. Gets or sets the Object Id of the Notification Action Source for this notification preference. If `ActionSource = CommunityGroup`, `ActionSourceId` would be the community group ID you want to receive notifications from. By default it is 0, which means all.

  ```
  public long ActionSourceId { set; get; }
  ```

- `ActivityTypeId`. Gets or sets the activity type for this notification preference. Built in CMS activity are defined in `EkEnumeration.ActivityType`.

  ```
  public long ActivityTypeId { set; get; }
  ```

- `AgentId`. Gets or sets the Provider Id for this notification preference.

  ```
  public long AgentId { set; get; }
  ```

- `Clone()`

  ```
  public Ektron.Cms.Notifications.NotificationPreferenceData Clone()
  ```

- `DataState`. Gets or sets the preferences persistence State. Used to determine the state of a preference when saving batches.

  ```
  public EkEnumeration.DataState DataState { set; get; }
  ```

- `Id`. Gets or sets the Id for this notification preference.

  ```
  public long Id { set; get; }
  ```

- `NotificationPreferenceData()`

  ```
  public NotificationPreferenceData()
  ```

- `NotificationPreferenceData(long, long, long, long, long)`

```
public NotificationPreferenceData(long id, long userId,
  long activityTypeId, long objectId, long agentId,
  long actionSourceId)
```

- `ObjectId`. Gets or sets the Object Id for this notification preference. The Object Id is related to the Object Type.

```
public long ObjectId { set; get; }
```

- `UserId`. Gets or sets the User Id for this notification preference.

```
public long UserId { set; get; }
```

- `Validate()`. Validates the current data class is an appropriate state for saving. Any errors are returned.

```
public ValidationResults Validate()
```

NotificationPublishPreferenceManager

8.50 and higher

The NotificationPublishPreferenceManager class manages preferences for notification agents that can be published.

A notification agent is a plug-able component that sends notification messages. Each Agent is responsible for sending notifications to users when CMS activity occurs. Once a Notification Agent is created and registered, users can set up notification preferences that use it.

For information about notifications, see Sending Notifications to a Community in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Settings.Notifications.NotificationPublishPreferenceManager
```

Constructors

- `NotificationPublishPreferenceManager()`
- `NotificationPublishPreferenceManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Notifications.NotificationPreferenceData)
```

Sets the list of activity types for publishing for a given user. The method disables any Activity Types not listed.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Activity Type ID

Parameters

- `userId`. ID to add notification publishing.
- `ActivityTypeIdList`. List of Activity Type IDs to enable publishing for.

        }
    }
```

AllowPublication

```
AllowPublication(System.Int64,System.Int64)
```

Retrieves true if the supplied activity type ID is enabled for publishing for the supplied User ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Activity Type ID

Parameters

- `userId`. ID to check publishing preferences for.
- `activityTypeId`. Activity Type ID to check publishing preferences for.

```

GetDefaultList

```
GetDefaultList()
```

Retrieves the list of default notification publishing preferences for the system.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            NotificationPublishPreferenceManager notificationPublishPreferenceManager =
new NotificationPublishPreferenceManager();

            List<NotificationPublishPreferenceData> notificationPublishPreferenceList =
notificationPublishPreferenceManager.GetDefaultList();

            uxnotificationPublishPreferenceListView.Visible = true;
            uxnotificationPublishPreferenceListView.DataSource =
notificationPublishPreferenceList;
            uxnotificationPublishPreferenceListView.DataBind();

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(System.Int64)
```

Retrieves the list of default notification publishing preferences for a user.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID

Parameters

- `userId`. User ID to return publishing preferences for.

        }
    }
```

UpdateDefaultPreferences

```
UpdateDefaultPreferences(System.Collections,Generic.List)
```

Updates the list of activity types for publishing for a given user.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- *Activity Type IDs (comma separated)

Parameters

- `ActivityTypeIdList`. List of Activity Type IDs to enable publishing for.

Remarks

Validate the activity type IDs with `GetItem()` before you update the properties. Then, call `Update` with your modified ActivityTypeData object.

NOTE: You cannot change all properties after the initial Add event, such as the ActivityTypeData.Type.

.aspx code snippet

```

UserNotificationSettingManager

8.50 and higher

The UserNotificationSettingManager class manages user-specified notifications. UserNotificationSettigns are user settings per notification agent. For example, to receive notifications via email, the user would need to provide his or her email address, and so on.

For information about notifications, see Sending Notifications to a Community in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Settings.Notifications.UserNotificationSettingManager
```

Constructors

- `UserNotificationSettingManager()`
- `UserNotificationSettingManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.
- `UserSettingService`. User setting service.

Methods

Add

```
Add(Ektron.Cms.UserNotificationSettingData)
```

Adds a UserNotificationSettingData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Agent ID
- Enable
- Verification Code

Parameters

- `userSettingData`. User setting data to save.

Returns

Returns the custom CmsData object added.

Delete

```
Delete(System.Int64)
```

Deletes a user notification setting from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Setting ID

Parameters

- `id`. ID of UserNotificationSettingData object to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

            }

            List<UserNotificationSettingData> NotificationSettingList =
userNotificationSettingManager.GetList(criteria);

            uxNotificationSettingListView.Visible = true;
            uxNotificationSettingListView.DataSource = NotificationSettingList;
            uxNotificationSettingListView.DataBind();

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Common.CustomPropertyData)
```

Updates an existing UserNotificationSettingData object item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Setting ID
- User ID
- Agent ID
- Enable
- Verification Code

Parameters

- `userSettingData`. User setting data to save.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the user notification setting item with `GetItem()` before you update the properties. Then, call `Update` with your modified UserNotificationSettingData object.

NOTE: You cannot change all properties after the initial Add event, such as the UserNotificationSettingData.Type.

```

VerifyValidationCode

```
VerifyValidationCode(System.Int64,System.String)
```

Verifies that the validation code is correct and enables users notfication settings.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Setting ID
- * Verification Code

Parameters

- `userSettingId`. ID of user notification setting.
- `verificationCode`. Verification code to validate.

Returns

Returns true if the verification code is correct.

        }
    }
```

Data Classes

UserNotificationSettingCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Notifications
```

Constructors

- `UserNotificationSettingCriteria()`

  ```
  public UserNotificationSettingCriteria()
  ```

- `UserNotificationSettingCriteria (Ektron.Cms.Notifications.UserNotificationSettingProperty, EkEnumeration.OrderByDirection)`

  ```
  public
    UserNotificationSettingCriteria
  (Ektron.Cms.Notifications.UserNotificationSettingProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `UserNotificationSettingProperty` are:

  - AgentId
  - Id
  - IsEnabled
  - UserId
  - VerificationCode

UserNotificationSettingData

Namespace

```
Ektron.Cms.Notifications
```

Properties

- `AgentId`. Gets or sets the ID of the Notification Agent associated with these settings.

```
public long AgentId { set; get; }
```

- `AgentSettings`. Gets or sets the user's settings for this notification provider.

```
public Ektron.Cms.Notifications.NotificationAgentSettingsData
  AgentSettings { set; get; }
```

- `IsEnabled`. Gets or sets the enabled setting for this user notification setting. This notification setting cannot be used if its not enabled.

```
public bool IsEnabled { set; get; }
```

- `UserId`. Gets or sets the user Id associated with these settings.

```
public long UserId { set; get; }
```

- `UserNotificationSettingData()`

```
public UserNotificationSettingData()
```

- `UserNotificationSettingData(long, long, long)`

```
public UserNotificationSettingData(long id, long userId,
  long agentId)
```

- `UserNotificationSettingData(long, long, long, Ektron.Cms.Notifications.NotificationAgentSettingsData)`

```
public UserNotificationSettingData(long id, long userId,
  long agentId, Ektron.Cms.Notifications.NotificationAgentSettingsData
  agentSettings)
```

- `Validate()`. Validates that the data object is valid for saving. Any errors are returns as ValidationResults.

```
public ValidationResults Validate()
```

- `VerificationCode`. Gets or sets the verificationcode for this setting. The user cannot recieve notifications on this provider until they verify this code.

```
public string VerificationCode { set; get; }
```

PermissionManager

8.50 and higher

The PermissionManager class manages user permissions. See *Managing Folder and Content Permissions* in Setting Up Your CMS Folder Structure in the Ektron Reference for information about standard and advanced permissions.

Namespace

```
Ektron.Cms.Framework.Settings.PermissionManager
```

Constructors

- `PermissionManager()`
- `PermissionManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `PermissionManagerService`. Returns an instance of the business objects PermissionManager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- `GetUserPermissionForContent(Int64,Int64,Int32).` 8.60 and higher Gets the users permission to a piece of content, for either the user or group the user is part of.
- `GetUserPermissionForFolder(Int64,Int64,Int32).` 8.60 and higher Gets the users permission to a folder, for either the user or group the user is part of.
- `IsLoggedInUserAdmin().` 8.60 and higher Checks if currently logged in user is a CMS administrator
- *Update* on page 1570

Add

```
Add(Ektron.Cms.Messaging.UserPermissionData)
```

Adds a user permission, with details from the supplied UserPermissionData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Content ID
- * User ID
- Is Membership User
- Is Inherited
- Is Private Content
- Is Read Only
- Can Edit
- Can Add
- Can Delete
- Is Read Only Lib

Parameters

- `permissionData`

Returns

Returns the custom CmsData object added.

    }
```

Delete

```
Delete(System.Int64)
```

Deletes a user permission from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Permission ID

Parameters

- `id`. User or Group ID.

Remarks

Validate the item with `GetItem()` before deleting it.

GetItem

```
GetItem(Ektron.Cms.UserPermissionData)
```

Retrieves the properties of a specific UserPermissionData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Permission ID

Parameters

- `id`. ID of the UserPermission to get.

Returns

UserPermission details in a UserPermissionData object.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(Ektron.Cms.Settings.PermissionCriteria)
```

Retrieves lists of objects through the GetList(PermissionCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- User Permission Property
- * Object Value

Parameters

- `criteria`. PermissionCriteria used to specify or filter the UserPermissionData object to return.

Returns

Returns a list of UserPermissions.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.UserPermissionData)
```

Updates an existing UserPermissionData item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Permission ID
- Content ID
- User ID
- Is Membership User
- Is Inherited
- Is Private Content
- Is Read Only
- Can Edit
- Can Add
- Can Delete
- Is Read Only Lib

Parameters

- `permissionData`

Returns

Returns the UserPermissionData object that was updated.

Remarks

Validate the User Permission Data item with `GetItem()` before you update the properties. Then, call `Update` with your modified UserPermissionData object.

NOTE: You cannot change all properties after the initial Add event, such as the UserPermissionData.Type.

Data Classes

PermissionCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Settings
```

Constructors

- `PermissionCriteria()`

  ```
  public PermissionCriteria()
  ```

- `PermissionCriteria(Ektron.Cms.Settings.PermissionProperty, EkEnumeration.OrderByDirection)`

  ```
  public PermissionCriteria(Ektron.Cms.Settings.PermissionProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `PermissionProperty` are:

  - CanAdd
  - CanDelete
  - CanEdit
  - ContentId
  - FolderId
  - Id
  - IsReadOnly
  - LanguageId
  - UserGroupId
  - UserId

UserPermissionData

Namespace

```
Ektron.Cms
```

Properties

- `ContentId`

  ```
  public long ContentId { set; get; }
  ```

- `DisplayGroupName`

  ```
  public string DisplayGroupName { set; get; }
  ```

- `DisplayUserName`

  ```
  public string DisplayUserName { set; get; }
  ```

- `Domain`

  ```
  public string Domain { set; get; }
  ```

- `FolderId`

  ```
  public long FolderId { set; get; }
  ```

- GroupDomain

```
public string GroupDomain { set; get; }
```

- GroupId

```
public long GroupId { set; get; }
```

- GroupName

```
public string GroupName { set; get; }
```

- InheritedFrom

```
public long InheritedFrom { set; get; }
```

- IsInherited

```
public bool IsInherited { set; get; }
```

- IsMembershipUser

```
public bool IsMembershipUser { set; get; }
```

- IsPrivateContent

```
public bool IsPrivateContent { set; get; }
```

- UserId

```
public long UserId { set; get; }
```

- UserName

```
public string UserName { set; get; }
```

- Validate()

```
public override
  Microsoft.Practices.EnterpriseLibrary.Validation.ValidationResults
  Validate()
```

SmartformConfigurationManager

8.50 and higher

The SmartformConfigurationManager class manages Smart Form configurations. See Working with Smart Forms in the Ektron Reference for information about Smart Forms.

Namespace

```
Ektron.Cms.Framework.Settings.SmartFormConfigurationManager
```

Constructors

- `SmartFormConfigurationManager()`
- `SmartFormConfigurationManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `SmartFormConfigurationManagerService`. Returns an instance of the business objects smartFormConfiguration manager service.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the next page
- *Delete* on page 1581
- *GetItem* on page 1583
- *GetList* on page 1585
- `GetXmlSearchFieldData(Int64)`. 8.60 and higher Retrieves a list of SmartFormIndexFieldData objects for the supplied smart form config id.
- *Update* on page 1588

Add

```
Add(Ektron.Cms.SmartFormConfigurationData)
```

Adds a SmartForm configuration based on information in an SmartFormConfigurationData object.

The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Type
- Description
- Field List

Parameters

- `smartFormConfigurationData`. The SmartFormConfigurationData object to add.

Returns

Returns the custom CmsData object added.

.aspx code snippet

Delete

```
Delete(System.Int64)
```

Deletes a SmartFormConfigurationData object from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the SmartFormConfigurationData object to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

Update

```
Update(Ektron.Cms.SmartFormConfigurationData)
```

Updates an existing SmartFormConfigurationData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Smart Form ID
- Title
- Type
- Description

Parameters

- `smartFormConfigurationData`. The SmartFormConfigurationData object to update.

Returns

Returns the custom CmsData object added.

Remarks

Validate the Smart Form configuration item with `GetItem()` before you update the properties. Then, call `Update` with your modified SmartFormConfigurationData object.

NOTE: You cannot change all properties after the initial Add event, such as the SmartFormConfigurationData.Type.

Data Classes

SmartFormConfigurationCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Content
```

Constructors

- `SmartFormConfigurationCriteria()`

  ```
  public SmartFormConfigurationCriteria()
  ```

- `SmartFormConfigurationCriteria (Ektron.Cms.Common.SmartFormConfigurationProperty, EkEnumeration.OrderByDirection)`

  ```
  public SmartFormConfigurationCriteria
  (Ektron.Cms.Common.SmartFormConfigurationProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `SmartFormConfigurationProperty` are:

  - DefaultXslt
  - Description
  - DisplatyXslt1 (DisplayXslt1)
  - DisplatyXslt2 (DisplayXslt2)
  - DisplatyXslt3 (DisplayXslt3)
  - DisplatyXslt4 (DisplayXslt4)
  - DisplatyXslt5 (DisplayXslt5)
  - EditXslt
  - FieldList
  - Id
  - LogicalPath
  - PackageDisplayXslt
  - PackageXslt
  - PhysicalPath
  - SaveXslt

- SecondType
- Title
- Type
- UserId
- XmlAdvConfig
- XmlNameSpace
- XmlSchema

SmartFormConfigurationData

Namespace

```
Ektron.Cms
```

Properties

- `DefaultXslt`. Display XSLT that being assigned from collection of display XSLTs.

  ```
  public int DefaultXslt { set; get; }
  ```

- `FieldList`. String that contains all the SmartForm Fields

  ```
  public string FieldList { set; get; }
  ```

- `LogicalPath`. SmartForm LogicalPath

  ```
  public string LogicalPath { set; get; }
  ```

- `PackageDisplayXslt`

  ```
  public string PackageDisplayXslt { set; get; }
  ```

- `PackageXslt`. Display XSLT Package (created using the Data Designer)

  ```
  public string PackageXslt { set; get; }
  ```

- `PhysicalPath`. SmartForm PhysicalPath

  ```
  public string PhysicalPath { set; get; }
  ```

- `SecondType`. public EkEnumeration.CatalogEntryType SecondType { set; get; }

  ```
  public EkEnumeration.CatalogEntryType SecondType { set; get; }
  ```

- `SmartformDescription`. Detailed description of configuration given by creator or last editor.

  ```
  public string SmartformDescription { set; get; }}
  ```

- `SmartformTitle`. SmartForm Title

  ```
  public string SmartformTitle { set; get; }
  ```

- `Type`. Set the Smartform Type(Content = 0,Product = 1,WebEvent = 2)

  ```
  public EkEnumeration.XmlConfigType Type { set; get; }
  ```

- `Validate()`

  ```
  public override ValidationResults Validate()
  ```

- `XmlSchema`. Display XSLT 1

  ```
  public string XmlSchema { set; get; }
  ```

- `Xslt1`. Display XSLT 1.
```
public string Xslt1 { set; get; }
```
- `Xslt2`. Display XSLT 2.
```
public string Xslt2 { set; get; }
```
- `Xslt3`. Display XSLT 3.
```
public string Xslt3 { set; get; }
```
- `Xslt4`. Display XSLT 4.
```
public string Xslt4 { set; get; }
```
- `Xslt5`. Display XSLT 5.
```
public string Xslt5 { set; get; }
```

TaskCommentManager

8.60 and higher

The TaskCommentManager class manages task comments. See Assigning and Managing Tasks in the Ektron Reference for information about tasks.

Namespace

```
Ektron.Cms.Framework.Settings.TaskCommentManager
```

Constructors

- `TaskCommentManager()`
- `TaskCommentManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.TaskCommentData)
```

Adds a task comment based on information in an TaskCommentData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title

Parameters

- `TaskCommentData`. The TaskCommentData object to add.

Returns

Added TaskCommentData object.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            TaskCommentManager taskCommentManager = new TaskCommentManager();
            TaskCommentData taskCommentData = new TaskCommentData()
            {
                TaskComment = uxTaskComment.Text,
                UserId = long.Parse(uxUserId.Text)
            };

             TaskCommentData retData= taskCommentManager.Add(taskCommentData);

            MessageUtilities.UpdateMessage(uxMessage, "Task added with Id " +
retData.Id, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
```

```
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a task comment from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. The ID of the task comment to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            long taskCommentId = long.Parse(uxTaskCommentId.Text);

            TaskCommentManager taskCommentManager = new TaskCommentManager();
            TaskCommentData taskCommentData = taskCommentManager.GetItem(taskCommentId);

             if (taskCommentData != null)
             {
                 taskCommentManager.Delete(taskCommentId);
                 MessageUtilities.UpdateMessage(uxMessage, "Task comment deleted.",
Message.DisplayModes.Success);
             }
             else
             {
                 MessageUtilities.UpdateMessage(uxMessage,"Task comment does not
exists.", Message.DisplayModes.Error);
             }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
```

```
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(Ektron.Cms.TaskCommentData)
```

Retrieves the properties of a specific TaskCommentData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the task comment to retrieve.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            long taskCommentId = long.Parse(uxTaskCommentId.Text);

            TaskCommentManager taskCommentManager = new TaskCommentManager();
            TaskCommentData taskCommentData = taskCommentManager.GetItem(taskCommentId);

            if (taskCommentData != null)
            {
                MessageUtilities.UpdateMessage(uxMessage, "Details for task comment with
ID " + taskCommentData.Id.ToString() + " are below", Message.DisplayModes.Success);

                uxTaskId.Text = "TaskId : " + taskCommentData.TaskId;
                uxTaskComment.Text = "TaskComment : " + taskCommentData.TaskComment;
                uxUserId.Text = "UserID : " + taskCommentData.UserId;
                uxCommentedDate.Text = "CreatedDate : " + taskCommentData.Commenteddate;
                uxModifiedDate.Text = "Modified Date : " +
taskCommentData.CommentUpdateddate;

            }
            else
            {
                MessageUtilities.UpdateMessage(uxMessage, "Task comment does not
exists.", Message.DisplayModes.Error);
```

```
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetList

```
GetList(Ektron.Cms.TaskCommentCriteria)
```

Retrieves lists of objects through the GetList(TaskCommentCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Task Category Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve task categories.

See *Criteria use for GetList methods* on page 156 for additional information.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            object Objectvalue;
            TaskCommentManager taskCommentManager = new TaskCommentManager();

            TaskCommentCriteria criteria = new TaskCommentCriteria();
            if (uxTaskCommentDataProperty.SelectedItem.Text == "TaskId")
            {
                Objectvalue = uxObjectValue.Text;
                criteria.AddFilter(TaskCommentProperty.TaskId ,
CriteriaFilterOperator.Contains, Objectvalue);
            }
            else
            {
                Objectvalue = uxObjectValue.Text;
                criteria.AddFilter(TaskCommentProperty.Comments,
CriteriaFilterOperator.EqualTo, Objectvalue);
```

```
            }

            List<TaskCommentData> taskCommentDataList = taskCommentManager.GetList
(criteria);

            uxTaskDataListView.Visible = true;
            uxTaskDataListView.DataSource = taskCommentDataList;
            uxTaskDataListView.DataBind();

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.SmartFormConfigurationData)
```

Updates an existing task comment item in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Title

Parameters

- `TaskCommentData`. The TaskCommentData object to update.

Returns

Updated TaskCommentData object.

Remarks

Validate the task comment item with `GetItem()` before you update the properties. Then, call `Update` with your modified TaskCommentData object.

NOTE: You cannot change all properties after the initial Add event, such as the TaskCommentData.Type.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            long taskCommentId = long.Parse(uxTaskCommentId.Text);

            TaskCommentManager taskCommentManager = new TaskCommentManager();
            TaskCommentData taskCommentData = taskCommentManager.GetItem(taskCommentId);

           if (taskCommentData != null)
            {
                taskCommentData.TaskComment = uxTaskComment.Text;
                taskCommentManager.Update(taskCommentData);

                MessageUtilities.UpdateMessage(uxMessage, "Task comment updated",
Message.DisplayModes.Success);
            }
           else
            {
               MessageUtilities.UpdateMessage(uxMessage, "Task comment does not
exists.", Message.DisplayModes.Error);
            }
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

TaskCategoryManager

8.50 and higher

The TaskCategoryManager class manages task categories. See Assigning and Managing Tasks in the Ektron Reference for information about tasks.

Namespace

```
Ektron.Cms.Framework.Settings.TaskCategoryManager
```

Constructors

- `TaskCategoryManager()`
- `TaskCategoryManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TaskCategoryManagerService`. Returns an instance of the business objects task manager service.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1602
- *GetItem* on page 1604
- *GetList* on page 1605
- *Update* on page 1608

Add

```
Add(Ektron.Cms.taskCategoryData)
```

Adds a task category based on information in a TaskCategoryData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title

Parameters

- `taskCategoryData`. The TaskCategoryData object to add.

Returns

Added TaskCategoryData object.

```

```
        }
    }
```

GetItem

```
GetItem(Ektron.Cms.TaskCategoryData)
```

Retrieves the properties of a specific TaskCategoryData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the task category to retrieve.

```

GetList

```
GetList(Ektron.Cms.TaskCategoryCriteria)
```

Retrieves lists of objects through the GetList(TaskCategoryCriteria) method.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Task Category Property
- * Object Value

Parameters

- `criteria`. Criteria used to retrieve task categories.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.SmartFormConfigurationData)
```

Updates an existing TaskCategoryData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Title

Parameters

- `taskCategoryData`. The TaskCategoryData object to update.

Returns

Updated TaskCategoryData object.

Remarks

Validate the task category item with `GetItem()` before you update the properties. Then, call `Update` with your modified TaskCategoryData object.

NOTE: You cannot change all properties after the initial Add event, such as the TaskCategoryData.Type.

    }
```

Data Classes

TaskCategoryCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Constructors

- `TaskCategoryCriteria()`

  ```
  public TaskCategoryCriteria()
  ```

- `TaskCategoryCriteria(Ektron.Cms.Common.TaskCategoryProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaskCategoryCriteria(Ektron.Cms.Common.TaskCategoryProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaskCategoryProperty` are:

  - Active
  - Id
  - Title

TaskCategoryData

Namespace

```
Ektron.Cms
```

Properties

- `Active`

  ```
  public int Active
  ```

- `ID`

```
public long ID { set; get; }
```

- `IsActive`. Gets or sets the Active flag.

```
public bool IsActive { set; get; }
```

- `Title`. Gets or sets the title of the Task Category.

```
public string Title { set; get; }
```

- `TaskCategoryData()`

```
public TaskCategoryData()
```

- `Types`

```
public Ektron.Cms.TaskTypeData[] Types { set; get; }
```

TaskManager

8.50 and higher

The TaskManager class manages tasks. See Assigning and Managing Tasks in the Ektron Reference for information about tasks.

Namespace

```
Ektron.Cms.Framework.Settings.TaskManager
```

Constructors

- `TaskManager()`
- `TaskManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `TaskManagerService`. Returns an instance of the business objects task manager service.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1616
- *GetItem* on page 1618
- *GetList* on page 1620
- *Update* on page 1622

Add

```
Add(Ektron.Cms.TaskData)
```

Adds a task based on information in a TaskData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Title
- * Priority
- * State
- * User ID
- * Content ID
- * Start Date Time
- * End Date Time
- Description

Parameters

- `taskData`. The TaskData object to add.

Returns

The added TaskData object.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a task from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the task to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

```

Update

```
Update(Ektron.Cms.TaskData)
```

Updates an existing TaskData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Title
- * Priority
- * State
- * User ID
- * Content ID
- * Start Date Time
- * End Date Time
- Description

Parameters

- `taskData`. The TaskData object to add.

Returns

The added TaskData object.

Remarks

Validate the task item with `GetItem()` before you update the properties. Then, call `Update` with your modified TaskData object.

NOTE: You cannot change all properties after the initial Add event, such as the TaskData.Type.

Data Classes

TaskCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Constructors

- `TaskCriteria()`

  ```
  public TaskCriteria()
  ```

- `TaskCriteria(Ektron.Cms.Common.TaskProperty, EkEnumeration.OrderByDirection)`

  ```
  public TaskCriteria(Ektron.Cms.Common.TaskProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `TaskProperty` are:

  - AssignedToGroupId
  - AssignedToUserId
  - ContentId
  - Description
  - DueDate
  - Id
  - Priority
  - Title

TaskData

Namespace

```
Ektron.Cms
```

Properties

- `AssignedByUser`

  ```
  public string AssignedByUser { set; get; }
  ```

- `AssignedByUserId`

  ```
  public string AssignedByUserID { set; get; }
  ```

- `AssignedToUser`. The username of the user who the task is assigned to. This value is populated when retrieving TaskData. While adding a new Task, use the AssignedToUserID property.

  ```
  public string AssignedToUser { set; get; }
  ```

- `AssignedToUserGroup`

  ```
  public string AssignedToUserGroup { set; get; }
  ```

- `AssignedToUserID`. The ID of the user to assign the task to. This is a required property to successfully assign a task to a user.

```
public long AssignedToUserID { set; get; }
```

- `Assignor`. The username of the user assigning the task.

```
public string Assignor { set; get; }
```

- `AssignorUserId`. The ID of the user assigning the task.

```
public long AssignorUserId { set; get; }
```

- `AssignToUserGroupID`

```
public long AssignToUserGroupID { set; get; }
```

- `CommentDisplayName`

```
public string CommentDisplayName { set; get; }
```

- `CommentEmail`

```
public string CommentEmail { set; get; }
```

- `CommentURI`

```
public string CommentURI { set; get; }
```

- `ContentID`

```
public long ContentID { set; get; }
```

- `ContentLanguage`

```
public int ContentLanguage { set; get; }
```

- `ContentTitle`

```
public string ContentTitle { set; get; }
```

- `ContentType`

```
public EkEnumeration.CMSContentType ContentType { set; get; }
```

- `CreatedByUser`

```
public string CreatedByUser { set; get; }
```

- `CreatedByUserID`

```
public long CreatedByUserID { set; get; }
```

- `DateCreated`

```
public string DateCreated { set; get; }
```

- `DateModified`

```
public string DateModified { set; get; }
```

- `Description`

```
public string Description { set; get; }
```

- `DisplayDateCreated`

```
public string DisplayDateCreated { set; get; }
```

- `DisplayDateModified`

```
public string DisplayDateModified { set; get; }
```

- `DueDate`

```
public string DueDate { set; get; }
```

- `FolderId`

```
public long FolderId { set; get; }
```

- Id

```
public override long Id { set; get; }
```

- ImpersonateUser

```
public bool ImpersonateUser { set; get; }
```

- Language

```
public string Language { set; get; }
```

- LanguageID

```
public int LanguageID { set; get; }
```

- LastComment

```
public string LastComment { set; get; }
```

- LastCommentUserID

```
public long LastCommentUserID { set; get; }
```

- ParentID

```
public long ParentID { set; get; }
```

- Priority

```
public EkEnumeration.TaskPriority Priority { set; get; }
```

- StartDate

```
public string StartDate { set; get; }
```

- State. One of the following values from Common.EkEnumeration.TaskState:
  - Prototype = "0"
  - NotStarted = "1"
  - Active = "2"
  - AwaitingData = "3"
  - OnHold = "4"
  - Pending = "5"
  - Reopened = "6"
  - Completed = "7"
  - Archived = "8"
  - Deleted = "9"

```
public string State { set; get; }
```

- Status. Obsolete: Use State

```
public int Status { set; get; }
```

- TaskID

```
public long TaskID { set; get; }
```

- TaskTitle

```
public string TaskTitle { set; get; }
```

- TaskTypeID

```
public long TaskTypeID { set; get; }
```

- `UserInfo`

```
public Ektron.Cms.UserData UserInfo { set; get; }
```

- `Validate()`

```
public override ValidationResults Validate()
```

TaxonomyCustomPropertyManager

8.50 and higher

The TaxonomyCustomPropertyManager class manages user-specified taxonomy properties.

Namespace

```
Ektron.Cms.Framework.Settings.TaxonomyCustomPropertyManager
```

Constructors

- `TaxonomyCustomPropertyManager()`
- `TaxonomyCustomPropertyManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.CustomPropertyData)
```

Adds a taxonomy custom property.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Name
- * Type
- Is Enabled
- Is Editable

Parameters

- `data`. CustomPropertyData object with the details to add.

Returns

Returns the custom CmsData object added.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a taxonomy custom property from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Language ID

Parameters

- `propertyId`. ID of the CustomPropertyData object to delete.
- `languageId`. Language Id of the CustomProperty to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

```

Retrieves a list of CustomPropertyData objects with their details.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Custom Property
- * Language ID
- * Records Per Page

Parameters

- `cmsObjectType`. Type of the CustomProperties to get.
- `languageId`. Language ID of the CustomProperties to get.
- `paging`. Paging details.

Returns

List of CustomPropertyData objects.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Common.CustomPropertyData)
```

Updates an existing taxonomy CustomPropertyData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Property ID
- * Language ID
- Name
- * Is Enabled
- * Is Editable

Parameters

- `data`. CustomPropertyData object with the details to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the taxonomy custom property item with `GetItem()` before you update the properties. Then, call `Update` with your modified CustomPropertyData object.

NOTE: You cannot change all properties after the initial Add event, such as the CustomPropertyData.Type.

  PropertyStyleType { set; get; }
```

UrlAliasing

8.50 and higher

The UrlAliasing manager category is a sub-category of Settings and manages URL aliases with the following classes:

- *AliasManager* below. Manages aliases.
- *AliasRuleManager* on page 1673. Manages alias rules.
- *AliasSettingManager* on page 1704. Manages alias settings.
- *AutoAliasManager* on page 1736. Manages automatic aliases, which lets you assign an alias to several content items at once.
- *CommonAliasManager* on page 1755. Gets alias and target data that is common to any alias.
- *CommunityAliasManager* on page 1759. Manages aliases that apply to communities.
- *ManualAliasManager* on page 1776. Manages manual aliases.
- *RedirectManager* on page 1792. Manages URL redirect addresses.
- *RegExAliasManager* on page 1812. Manages regular expressions that replace URLs that cannot be read.

AliasManager

8.61 and higher

The AliasManager class manages aliases. See Creating User-Friendly URLs with Aliasing in the Ektron Reference for information about aliases.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.AliasManager
```

Constructors

- `AliasManager()`
- `AliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1654
- `DeleteAll()`. Deletes all aliases.
- *GetItem* on page 1658
- *GetList* on page 1661
- *GetTarget* on page 1663
- *IsValidEktronAlias* on page 1666
- *Update* on page 1667

Add

```
Add(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasData)
```

Adds a message based on information in an URL AliasData object.

The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Name
- * Extension
- * Content ID
- * Language ID

Parameters

- `data`. AliasData data.

Returns

Returns the AliasData object added.

Delete

```
Delete(System.Int64)
```

Deletes an AliasData object from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias ID

Parameters

- `id`. Unique ID of the alias.

Remarks

Validate the item with `GetItem()` before deleting it.

GetAlias

```
GetAlias(System.Int64,System.Int32,Ektron.Cms.Common.EkEnumeration.TargetType)
```

Gets alias by TargetId, LanguageId and TargetType.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Target ID
- * Language ID
- * Target Type

Parameters

- `TargetId`. ID of the target.
- `LanguageId`. ID of Lanaguage.
- `targetType`. Type of target.

Returns

Returns AliasData object.

GetList

```
GetList(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Alias Property
- * Object Value

Parameters

- `criteria`. AliasCriteria defining which AutoAlias to get.

Returns

List of AliasData data.

See *Criteria use for GetList methods* on page 156 for additional information.

            List<AliasData> aliasDataList = aliasManager.GetList(criteria);
            uxAliasListView.Visible = true;
            uxAliasListView.DataSource = aliasDataList;
            uxAliasListView.DataBind();

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetTarget

```
GetTarget(System.Uri,System.Int64)
```

Retrieves the alias information for given URL.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Name
- * Extension

- * Language ID

Parameters

- `url`. URL to get alias information.
- `Language ID`. ID of language.

Returns

AliasData object.

        }
    }
```

Update

```
Update(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasData)
```

Updates an AliasData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Id
- * Alias Name

- Extension
- Content ID
- Query String
- Is Enabled
- Is Default

Parameters

- `data`. UrlAutoAlias data

Returns

Returns the custom AliasData object updated.

Remarks

Validate the message item with `GetItem()` before you update the properties. Then, call `Update` with your modified AliasData object.

NOTE: You cannot change all properties after the initial Add event, such as the AliasData .Type.

Data Classes

AliasCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Constructors

- `AliasCriteria()`

  ```
  public AliasCriteria()
  ```

- `AliasCriteria (Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasProperty, EkEnumeration.OrderByDirection)`

  ```
  public AliasCriteria(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `AliasProperty` are:

  - Alias
  - ConfigurationId
  - Id
  - IsDefault
  - IsEnabled
  - LanguageId
  - NodeId
  - QueryString
  - QueryStringAction
  - SiteId
  - Target
  - TargetId
  - Type

AliasData

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Properties

- `Alias`. The Alias URL, will be used to match incoming requests

  ```
  public string Alias { set; get; }
  ```

- `AliasData()`

  ```
  public AliasData()
  ```

- `ConfigurationId`. Parent Alias configuration that generated this alias.

  ```
  public long ConfigurationId { set; get; }
  ```

- `Id`

  ```
  public long Id { set; get; }
  ```

- `IsDefault`

```
public bool IsDefault { set; get; }
```

- `IsEnabled`

```
public bool IsEnabled { set; get; }
```

- `LanguageId`. The Language Id of the alias.

```
public int LanguageId { set; get; }
```

- `NodeId`

```
public long NodeId { set; get; }
```

- `QueryString`

```
public string QueryString { set; get; }
```

- `QueryStringAction`

```
public EkEnumeration.QueryStringActionType QueryStringAction { set; get; }
```

- `SiteId`. The multisite ID.

```
public long SiteId { set; get; }
```

- `TargetId`

```
public long TargetId { set; get; }
```

- `TargetType`

```
public EkEnumeration.TargetType TargetType { set; get; }
```

- `TargetURL`

```
public string TargetURL { set; get; }
```

- `Type`

```
public EkEnumeration.AliasRuleType Type { set; get; }
```

AliasRuleManager

8.61 and higher

The AliasRuleManager class manages alias rules. See Creating User-Friendly URLs with Aliasing in the Ektron Reference for information about aliases.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.AliasRuleManager
```

Constructors

- `AliasRuleManager()`
- `AliasRuleManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.

- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Common.UrlAliasAutoData)
```

Adds an alias rule. AliasRuleData.Id is populated with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Rule Type
- * Alias Rule Name
- Language ID
- * Source ID
- Exclude Path ID
- Alias Format
- * Extension

- Query String
- Is Enabled

Parameters

- `data`. AliasRuleData data.

Returns

Returns added AliasRuleData object.

```

Delete

```
Delete(System.Int64)
```

Deletes alias rule and aliases by configuration ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Rule ID

Parameters

- `ConfigId`. ID of AliasRuleData configuration.

Remarks

Validate the item with `GetItem()` before deleting it.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

DeleteAliases

```
DeleteAliases(System.Int64)
```

Delete aliases by configuration ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Rule ID

Parameters

- `ConfigId`. ID of AliasRuleData configuration.

Remarks

Validate the item with `GetItem()` before deleting it.

    }
```

GetList (AliasRule)

```
GetList(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasRuleCriteria)
```

Retrieves list of AliasRuleData objects based on supplied criteria.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Rule Property
- * Object Value

Parameters

- `criteria`. AliasRuleCriteria used to retrieve the AliasRule.

Returns

Returns list of AliasRuleData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

GetList (objects)

```
GetList
(System.Int64,Ektron.Cms.Common.EkEnumeration.AliasRuleType,System.Int64,System.Int32)
```

Retrieves list of AliasRuleData objects by SourceId, AliasRuleType, SiteId and LanguageId.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Source ID
- * Alias Rule Type
- * Site ID
- * Language ID

Parameters

- `SourceId`. ID of the source, for that AliasRule is created.
- `type`. Type of AliasRule.
- `siteId`. ID of the site.
- `languageId`. ID of the language.

Returns

Returns list of AliasRuleData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Update

```
Update(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasRuleData)
```

Updates the supplied AliasRuleData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Rule ID
- Alias Rule Name
- Source ID
- Exclude Path ID
- Alias Format
- Extension
- Query String
- Is Enabled

Parameters

- `data`. AliasRuleData object.

Returns

Returns updated AliasRuleData object.

Remarks

Validate the message item with `GetItem()` before you update the properties. Then, call `Update` with your modified AliasRuleData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasAutoData .Type.

Data Classes

AliasRuleCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Constructors

- `AliasRuleCriteria()`

  ```
  public AliasRuleCriteria()
  ```

- `AliasRuleCriteria (Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasRuleProperty, EkEnumeration.OrderByDirection)`

  ```
  public AliasRuleCriteria
  (Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasRuleProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `AliasRuleProperty` are:

- AliasPriority
- ExcludePathId
- FileExtensionId
- Id
- IsDeleted
- IsEnabled
- LanguageId
- Name
- PageTypeId
- Prefix
- SiteId
- SourceId
- SourceParamName
- TargetTemplateSource
- Type

AliasRuleData

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Properties

- `AliasPriority`. The priority order.

  ```
  public int AliasPriority { set; get; }
  ```

- `AliasRuleData()`

  ```
  public AliasRuleData()
  ```

- `ExcludePathId`

  ```
  public long ExcludedPathId { set; get; }
  ```

- `FileExtensionId`. The file extension to use in alias generation.

  ```
  public long FileExtensionId { set; get; }
  ```

- `Id`. Unique Identifier for this record.

  ```
  public long Id { set; get; }
  ```

- `IsDeleted`. Indicates deleted status. Rules are soft deleted.

  ```
  public bool IsDeleted { set; get; }
  ```

- `IsEnabled`. Indicates if this configuration is enabled.

  ```
  public bool IsEnabled { set; get; }
  ```

- `LanguageId`. The language ID.

```
public int LanguageId { set; get; }
```

- `Name`. Friendly name of this configuration.

```
public string Name { set; get; }
```

- `PageTypeId`

```
public EkEnumeration.AutoAliasNameType PageTypeId { set; get; }
```

- `Prefix`

```
public string Prefix { set; get; }
```

- `ReplacementCharacterMap`

```
public System.Collections.Generic.List<ReplacementCharacter>
  ReplacementCharacterMap { set; get; }
```

- `SiteId`. The multisite ID.

```
public long SiteId { set; get; }
```

- `SourceId`. Optional. Source entity in the CMS. This changes meaning depending on the ConfigurationType. If its Folder Alias this is a folder Id, if taxonomy alias, its a Taxonomy ID.

```
public long SourceId { set; get; }
```

- `SourceParamName`

```
public string SourceParamName { set; get; }
```

- `TargetTemplateSource`

```
public EkEnumeration.TargetTemplateSource TargetTemplateSource { set; get;
}
```

- `Type`. The type of alias.

```
public EkEnumeration.AliasRuleType Type { set; get; }
```

AliasSettingManager

8.61 and higher

The AliasSettingManager class manages alias settings. See Creating User-Friendly URLs with Aliasing in the Ektron Reference for information about aliases.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.AliasSettingManager
```

Constructors

- `AliasSettingManager()`
- `AliasSettingManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

AddFileExtension

```
AddFileExtension(Ektron.Cms.Settings.UrlAliasing.DataObjects.FileExtension)
```

Adds a file extension. FileExtension.Id is populated with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * File Extension

Parameters

- `extension`. File extension object.

Returns

Returns FileExtension object.

```

DeleteExtension

```
DeleteExtension(System.Int64)
```

Deletes an extension by extension ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Extension ID

Parameters

- `extensionid`. ID of the extension.

Remarks

Validate the item with `GetItem()` before deleting it.

```

Get (name and site)

```
Get(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasSettingName,System.Int64)
```

Retrieves the AliasSettings value by setting name and site ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Setting Name
- * Site ID

Parameters

- `settingName`. Name of setting.
- `siteID`. ID of site.

Returns

Returns AliasSettings value.

```

GetAllExtensionsOnly (site ID)

```
GetAllExtensionsOnly(System.Int64)
```

Retrieves FileExtension objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Site ID

Parameters

- `siteId`. ID of site.

Returns

Returns FileExtension objects.

```

Update (aliasSetting)

```
Update(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasSettings)
```

Updates the setting if the setting name and site ID matches in database; else inserts new record.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Site ID
- Default Replacement Character
- Is Alias Fallback Enabled
- Is Aliasing Enabled
- Is Folder Aliasing Enabled
- Is Group Aliasing Enabled
- Is Manual Aliasing Enabled
- Is RegEx Aliasing Enabled
- Is Taxonomy Aliasing Enabled
- Is URL Redirect Enabled
- Is User Aliasing Enabled
- Override Template
- Query String Action

Parameters

- `settings`. AliasSettings object.

Returns

Returns updated AliasSettings object.

Remarks

Validate the message item with `GetItem()` before you update the properties. Then, call `Update` with your modified UrlAliasData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasAutoData .Type.

```

Update (name and ID)

```
Update
(Ektron.Cms.Settings.UrlAliasing.DataObjects.AliasSettingName,System.String,System.Int6
4)
```

Updates the setting if setting name and site ID matches in database; else inserts new record.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Setting
- * Alias Setting
- * Site ID

Parameters

- `settingName`. Name of the setting.
- `settingvalue`. Value of the setting.
- `siteID`. ID of the site.

Remarks

Validate the message item with `GetItem()` before you update the properties. Then, call `Update` with your modified UrlAliasData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasAutoData .Type.

```

AutoAliasManager

8.50 and higher

The AutoAliasManager class manages automatic aliases, which lets you assign an alias to several content items at once. See Creating User-Friendly URLs with Aliasing in the Ektron Reference for information about aliases.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.AutoAliasManager
```

Constructors

- `AutoAliasManager()`
- `AutoAliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *ClearCache* on page 1738
- *Delete* on page 1739
- *GetItem* on page 1741
- *GetList* on page 1743
- *GetTarget (alias and host)* on page 1745
- *GetTarget (alias, host and type)* on page 1747
- *Update* on page 1749

Add

```
Add(Ektron.Cms.Common.UrlAliasAutoData)
```

Adds a UrlAliasAutoData object.

The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Auto Alias Type
- * Extension
- Source ID
- Is Enabled

Parameters

- `data`. UrlAliasAutoData object.

Returns

Returns the custom CmsData object added.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

ClearCache

```
ClearCache()
```

Clears the cache. This method has no parameters.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            AutoAliasManager autoAliasManager = new AutoAliasManager();
            autoAliasManager.ClearCache();

            MessageUtilities.UpdateMessage(uxMessage, "Cache Cleared",
Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a UrlAliasAutoData object from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. Unique ID of the AutoAlias

Remarks

Validate the item with `GetItem()` before deleting it.

        }
    }
```

GetTarget (alias and host)

```
GetTarget(System.String,System.String)
```

Retrieves the target data based on the URL alias and the host.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * URL Alias
- Host

Parameters

- `urlAlias`. urlAlias of the target to retrieve.
- `host`. Host of the target to retrieve.

Returns

Target string.

        }
    }
```

Update

```
Update(Ektron.Cms.AutoAliasData)
```

Updates an existing UrlAutoAlias in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Extension
- Source ID
- * Is Enable

Parameters

- `data`. UrlAliasAutoData object

Returns

Returns the custom CmsData object updated.

Remarks

Validate the message item with `GetItem()` before you update the properties. Then, call `Update` with your modified UrlAliasAutoData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasAutoData .Type.

Data Classes

AutoAliasCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.UrlAliasing
```

Constructors

- `AutoAliasCriteria()`

  ```
  public AutoAliasCriteria()
  ```

- `AutoAliasCriteria(Ektron.Cms.UrlAliasing.AutoAliasProperty, EkEnumeration.OrderByDirection)`

  ```
  public AutoAliasCriteria(Ektron.Cms.UrlAliasing.AutoAliasProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `AutoAliasProperty` are:

- AutoAliasType
- Example
- ExcludedPath
- FileExtension
- IsEnabled
- LanguageId
- PageNameType
- ReplacementCharacter
- SelectedPath
- SiteId
- SourceId
- SourceName
- SourceParmName

AutoAliasType

Namespace

```
Ektron.Cms.Common.EkEnumeration
```

Properties

- `Folder`

```
public Const Folder As Ektron.Cms.Common.EkEnumeration.AutoAliasType = 2
```

- `Taxonomy`

```
public Const Taxonomy As Ektron.Cms.Common.EkEnumeration.AutoAliasType = 1
```

UrlAliasAutoData

Namespace

```
Ektron.Cms.Common
```

Properties

- `AliasName`. Gets or sets the alias name for the URL.

```
public string AliasName { set; get; }
```

- `AutoAliasType`. Gets or sets the automatic alias source type. Types are Taxonomy and Folder.

```
public EkEnumeration.AutoAliasType AutoAliasType { set; get; }
```

- `AutoId`. Gets the unique ID generated for this record.

```
public long AutoId { set; get; }
```

- `ContentId`

```
public long ContentId { set; get; }
```

- `Example`. Gets or sets a sample of the selected configuration.

```
public string Example { set; get; }
```

- `ExcludedPath`. Returns the folder or taxonomy path excluded from the selected path.

```
public string ExcludedPath { set; get; }
```

- `FileExtension`. Gets or sets the selected file extension.

```
public string FileExtension { set; get; }
```

- `FormattedSelectionPath`. Returns the folder or taxonomy path with modifications.

```
public string FormattedSelectedPath { get; }
```

- `HostName`. Gets the name of the host where the content resides.

```
public string HostName { set; get; }
```

- `Id`. Gets the unique ID generated for this record.

```
public override long Id { set; get; }
```

- `IsEnabled`. Gets or sets whether the configuration is active or not.

```
public bool IsEnabled { set; get; }
```

- `LanguageId`. Gets the language ID for the automatic alias.

```
public int LanguageId { set; get; }
```

- `PageNameType`. Gets or sets the name for the configuration. Available types are:
  - ContentTitle
  - ContentId
  - ContentIdAndLanguage

```
public EkEnumeration.AutoAliasNameType PageNameType { set; get; }
```

- `ReplacementCharacter`. Gets or sets the character that will replace special characters in the generated URL.

```
public string ReplacementCharacter { set; get; }
```

- `SelectedPath`. Returns the folder or taxonomy path selected by the user.

```
public string SelectedPath { set; get; }
```

- `SiteId`. Gets or sets the root folder ID of the site. If no site is specified, returns zero (0).

```
public long SiteId { set; get; }
```

- `SourceId`. Gets or sets either the taxonomy ID or the folder ID depending on the auto alias type selected.

```
public long SourceId { set; get; }
```

- `SourceName`. Gets the name of the taxonomy or folder selected depending on the auto alias type selected.

```
public string SourceName { set; get; }
```

- `SourceParmName`

```
public string SourceParmName { set; get; }
```

- `Target`. Gets or sets the destination for the alias.

```
public string Target { set; get; }
```

- `TimeStamp`

```
public System.DateTime TimeStamp { set; get; }
```

- `UrlAliasAutoData()`

```
public UrlAliasAutoData()
```

- `UrlAliasAutoData(long, EkEnumeration.AutoAliasType, long, string)`

```
public UrlAliasAutoData(long siteId,
  EkEnumeration.AutoAliasType autoAliasType,
  long sourceId, string fileExtension)
```

- `UrlAliasAutoData(long, EkEnumeration.AutoAliasType, long, string, long, string, string, int, string, bool, string, EkEnumeration.AutoAliasNameType, string, string, string, System.DateTime, long, string, string)`

```
public UrlAliasAutoData(long siteId,
  EkEnumeration.AutoAliasType autoAliasType,
  long sourceId, string fileExtension, long autoId,
  string aliasName, string target, int languageId,
  string sourceName, bool isEnabled, string example,
  EkEnumeration.AutoAliasNameType pagenametype,
  string replacementCharacter, string hostName,
  string selectedPath, System.DateTime timeStamp,
  long contentId, string excludedPath, string sourceParmname)
```

CommonAliasManager

8.50 and higher

The CommonAliasManager class gets alias and target data that is common to any alias.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.CommonAliasManager
```

Constructors

- `CommonAliasManager()`
- `CommonAliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *GetContentAlias* below
- *GetTarget* on page 1757

GetContentAlias

```
GetContentAlias(System.Int64)
```

Retrieves the alias of a content item.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `contentId`. ID of the content.

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxContentIdLabel" AssociatedControlID="uxContentId"
CssClass="span-3 last" runat="server" Text="* Id :" />
        <ektronUI:TextField ID="uxContentId" CssClass="span-6" runat="server"
ValidationGroup="RegisterValidationGroup" />
    </li>

        <ektronUI:Button id="uxSubmit" runat="server" OnClick="uxSubmit_Click" Text="Get
Content Alias"></ektronUI:Button>
        <ektronUI:Label ID="uxRequiredLabel" CssClass="span-3" runat="server" Text="* -
Required" />
    </li>
</ol>

<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

.aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
using Ektron.Cms.Framework.Settings.UrlAliasing;
```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            CommonAliasManager commonAliasManager = new CommonAliasManager();
            string contentAlias = commonAliasManager.GetContentAlias(long.Parse
(uxContentId.Text));

            MessageUtilities.UpdateMessage(uxMessage, "Content Alias :   " +
contentAlias, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetTarget

```
GetTarget(System.Uri)
```

Retrieves the target of a uniform resource identifier (URI).

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * URI

Parameters

- `uri`

.aspx code snippet

```
<ol class="formFields">
    <li class="clearfix">
        <ektronUI:Label ID="uxUriLabel" AssociatedControlID="uxUri" CssClass="span-3
last" runat="server" Text="* Uri :" />

        <ektronUI:Button id="uxSubmit" runat="server" OnClick="uxSubmit_Click" Text="Get
Target"></ektronUI:Button>
        <ektronUI:Label ID="uxRequiredLabel" CssClass="span-3" runat="server" Text="* -
Required" />
    </li>
</ol>

<asp:Literal ID="uxMessage" runat="server"></asp:Literal>
```

.aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
using Ektron.Cms.Framework.Settings.UrlAliasing;
```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
```

```
        {
            Uri uri = new Uri(uxUri.Text);

            CommonAliasManager commonAliasManager = new CommonAliasManager();

            string contentAlias = commonAliasManager.GetTarget(uri);

            MessageUtilities.UpdateMessage(uxMessage, "Target :   " + contentAlias,
Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

CommunityAliasManager

8.50 and higher

The CommunityAliasManager class manages aliases that apply to communities.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.CommunityAliasManager
```

Constructors

- `CommunityAliasManager()`
- `CommunityAliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Common.UrlAliasCommunityData)
```

Adds a UrlAliasCommunityData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Community Alias Type
- * Extension
- * Alias Path
- Is Enabled
- Primary

Parameters

- `data`

Returns

Returns the custom CmsData object added.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
```

```
        }
    }
```

GetList

```
GetList(Ektron.Cms.UrlAliasing.CommunityAliasCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Community Alias Property
- * Object Value

Parameters

- `criteria`. CommunityAliasCriteria used to specify, or filter, the list of UrlAliasCommunityData objects to return.

Returns

A list of UrlAliasCommunityData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

Remarks

Use ListView because it has a paging option and data grouping.

Use the default page size = 50.

protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            CommunityAliasManager communityAliasManager = new CommunityAliasManager();
            string userAlias = communityAliasManager.GetUserAlias(long.Parse
(uxUserId.Text));
            if(userAlias != string.Empty)
                 MessageUtilities.UpdateMessage(uxMessage, "User Alias :    " +
userAlias, Message.DisplayModes.Success);
            else
             MessageUtilities.UpdateMessage(uxMessage, "User Alias does not exists. ",
Message.DisplayModes.Error);

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
```

```
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Common.UrlAliasCommunityData)
```

Updates a UrlAliasCommunity, with details from the supplied UrlAliasCommunityData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Community Alias ID
- * Extension
- Alias Path
- * Is Enabled
- * Primary

Parameters

- `data`

Returns

Returns the custom CmsData object updated.

Remarks

Validate the community alias with `GetItem()` before you update the properties. Then, call `Update` with your modified UrlAliasCommunityData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasCommunityData .Type.

Data Classes

CommunityAliasCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.UrlAliasing
```

Constructors

- `CommunityAliasCriteria()`

  ```
  public CommunityAliasCriteria()
  ```

- `CommunityAliasCriteria (Ektron.Cms.UrlAliasing.CommunityAliasProperty,`

EkEnumeration.OrderByDirection)

```
public CommunityAliasCriteria(Ektron.Cms.UrlAliasing.CommunityAliasProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `CommunityAliasProperty` are:

- AliasPath
- CommunityAliasType
- Example
- FileExtension
- Id
- IsDefault
- IsEnabled
- LanguageId
- ReplacementCharacter
- SiteId
- SourceParmName

UrlAliasCommunityData

Namespace

```
Ektron.Cms.Common
```

Properties

- `AliasName`

  ```
  public string AliasName { set; get; }
  ```

- `AliasPath`

  ```
  public string AliasPath { set; get; }
  ```

- `CommunityAliasType`

  ```
  public EkEnumeration.CommunityAliasType
    CommunityAliasType { set; get; }
  ```

- `DisplayName`

  ```
  public string DisplayName { set; get; }
  ```

- `Example`. Gets or sets a sample of the selected configuration.

  ```
  public string Example { set; get; }
  ```

- `FileExtension`

  ```
  public string FileExtension { set; get; }
  ```

- `HostName`. Gets the name of the host where the content resides.

  ```
  public string HostName { set; get; }
  ```

- `Id`. Gets the unique ID generated for this record.

  ```
  public long Id { set; get; }
  ```

- `IsDefault`

```
public bool IsDefault { set; get; }
```

- `IsEnabled`. Gets or sets whether the configuration is active.

```
public bool IsEnabled { set; get; }
```

- `LanguageId`. Gets the language ID for the automatic alias.

```
public int LanguageId { set; get; }
```

- `ObjectId`

```
public long ObjectId { set; get; }
```

- `ReplacementCharacter`. Gets or sets the character that will replace special characters in the generated URL.

```
public string ReplacementCharacter { set; get; }
```

- `SiteId`

```
public long SiteId { set; get; }
```

- `SourceParmName`

```
public string SourceParmName { set; get; }
```

- `Target`. Gets the destination for the alias.

```
public string Target { set; get; }
```

- `TimeStamp`

```
public System.DateTime TimeStamp { set; get; }
```

- `UrlAliasCommunityData()`

```
public UrlAliasCommunityData()
```

- `UrlAliasCommunityData(long, EkEnumeration.CommunityAliasType, string, string)`

```
public UrlAliasCommunityData(long siteId,
  EkEnumeration.CommunityAliasType communityAliasType,
  string aliasPath, string fileExtension)
```

ManualAliasManager

8.50 and higher

The ManualAliasManager class manages manual aliases.

When using manual aliasing, you choose a page name and then specify the content to appear whenever anyone enters the URL using that name into a browser address field. For example, you can alias `www.example.com/cms/index.aspx` as `www.example.com/cms/Launch.html`. From then on, the content can be identified either by its original URL or its alias.

For information about manual aliasing, see Creating User-Friendly URLs with Aliasing in the Ektron Reference.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.ManualAliasManager
```

Constructors

- `ManualAliasManager()`
- `ManualAliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* on the facing page
- *ClearCache* on page 1779
- *Delete* on page 1779
- *GetDefaultAlias* on page 1781
- *GetItem* on page 1783

- *GetList* on page 1785
- *Update* on page 1787

Add

```
Add(Ektron.Cms.Common.UrlAliasManualData)
```

Adds a URL alias based on information in a UrlAliasManualData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Alias Name
- * Extension
- Is Enabled
- Is Default
- * Content ID

Parameters

- `data`. UrlAliasManualData data.

Returns

Returns the custom CmsData object added.

                  AliasName = uxAliasName.Text ,
                  FileExtension = uxExtension.SelectedItem.Text,
                  ContentId = long.Parse(uxContentId.Text),
            };

            manualAliasManager.Add(urlAliasManualData);

            MessageUtilities.UpdateMessage(uxMessage, "Manual Alias added with Id " +
urlAliasManualData.Id, Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
```

```
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

ClearCache

```
ClearCache()
```

Clears the cache. This method has no parameters.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            ManualAliasManager manualAliasManager = new ManualAliasManager();
            manualAliasManager.ClearCache();

            MessageUtilities.UpdateMessage(uxMessage, "Cache Cleared",
Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes a URL alias (UrlAliasManualData) from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. Unique ID of the ManualAlias.

Remarks

Validate the item with `GetItem()` before deleting it.

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- Manual Alias Property
- * Object Value

Parameters

- `criteria`. ManualAliasCriteria defining which UrlAliasManualData to get.

Returns

List of UrlAliasManualData data.

See *Criteria use for GetList methods* on page 156 for additional information.

    }
```

Update

Update(Ektron.Cms.UserCustomPropertyData)

Updates an existing URL alias based on information in a UrlAliasManualData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- Alias Name
- Extension
- Is Enabled
- Is Default
- Content ID

Parameters

- `data`. UrlAliasManualData data.

Returns

Returns the custom CmsData object added.

Remarks

Validate the URL alias with `GetItem()` before you update the properties. Then, call `Update` with your modified `UrlAliasManualData` object.

NOTE: You cannot change all properties after the initial `Add` event, such as the `UrlAliasManualData.Type`.

Data Classes

ManualAliasCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.UrlAliasing
```

Constructors

- `ManualAliasCriteria()`

  ```
  public ManualAliasCriteria()
  ```

- `ManualAliasCriteria(Ektron.Cms.UrlAliasing.ManualAliasProperty, EkEnumeration.OrderByDirection)`

  ```
  public ManualAliasCriteria(Ektron.Cms.UrlAliasing.ManualAliasProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `ManualAliasProperty` are:

  - AliasId
  - AliasName
  - AliasPageName
  - ContentId

- ContentLanguage
- ContentTitle
- DisplayAlias
- FileExtension
- HostName
- IsDefault
- LibraryId
- QueryString
- QueryStringAction
- SiteId
- Target

UrlAliasManualData

Namespace

```
Ektron.Cms.Common
```

Properties

- `AliasId`. Gets the unique ID generated for this record.
  ```
  public long AliasId { set; get; }
  ```
- `AliasName`. Gets or sets the alias name for the URL without the extension.
  ```
  public string AliasName { set; get; }
  ```
- `AliasPageName`. Gets the name of the alias without the query string.
  ```
  public string AliasPageName { set; get; }
  ```
- `ContentId`. Gets or sets the Content ID.
  ```
  public long ContentId { set; get; }
  ```
- `ContentLanguage`. Gets the content language.
  ```
  public int ContentLanguage { set; get; }
  ```
- `ContentTitle`. Gets the title of the content.
  ```
  public string ContentTitle { set; get; }
  ```
- `DisplayAlias`. Gets the alias URL with the extension and query parameters. This is a computed field.
  ```
  public string DisplayAlias { set; get; }
  ```
- `FileExtension`. Gets or sets the file extension for the alias.
  ```
  public string FileExtension { set; get; }
  ```
- `HostName`. Public string HostName { set; get; }
  ```
  public string HostName { set; get; }
  ```
- `Id`. Gets the unique ID generated for this record.
  ```
  public override long Id { set; get; }
  ```

- `IsDefault`. Gets or sets which alias name should show when the content has multiple aliases.

```
public bool IsDefault { set; get; }
```

- `IsEnabled`. Gets or sets whether the alias name is active.

```
public bool IsEnabled { set; get; }
```

- `LibraryId`. Gets or sets the Library ID for the content.

```
public long LibraryId { set; get; }
```

- `QueryString`. Gets or sets the querystring parameters to append to the aliased URL.

```
public string QueryString { set; get; }
```

- `QueryStringAction`. Gets or sets the querystringaction parameters.

```
public EkEnumeration.QueryStringActionType
  QueryStringAction { set; get; }
```

- `SiteId`. Gets the root folder ID of the site. If no site is specified, returns 0 (zero).

```
public long SiteId { set; get; }
```

- `Target`

```
public string Target { set; get; }
```

- `TimeStamp`. Gets or sets the destination URL for the alias.

```
public System.DateTime TimeStamp { set; get; }
```

- `UrlAliasManualData()`

```
public UrlAliasManualData()
```

- `UrlAliasManualData(long, long, string, string)`

```
public UrlAliasManualData(long contentId, long libraryId,
  string aliasName, string fileExtension)
```

- `UrlAliasManualData(long, string, string)`

```
public UrlAliasManualData(long contentId, string aliasName,
  string fileExtension)
```

RedirectManager

8.61 and higher

The RedirectManager class manages URL redirect addresses.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.RedirectManager
```

Constructors

- `RedirectManager()`
- `RedirectManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

- *Add* below
- *Delete* on page 1796
- *DeleteAll* on page 1798
- *GetItem* on page 1799
- *GetList* on page 1801
- *GetTarget* on page 1804
- *Update* on page 1806

Add

```
Add(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectData)
```

Adds a RedirectData object. RedirectData.Id is populated with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Site
- * Redirect Code
- Original URL
- New URL
- Active

Parameters

- `data`. RedirectData object.

Returns

Returns added RedirectData object.

        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes redirect information from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Redirect ID

Parameters

- `Redirectid`. The ID of the redirect information.

Remarks

Validate the item with `GetItem()` before deleting it.

GetList

```
GetList(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectCriteria)
```

Retrieves list of RedirectData objects based on supplied criteria.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Object Value

Parameters

- `criteria`. RedirectCriteria used to retrieve the redirect information.

Returns

Returns a list of RedirectData objects.

See *Criteria use for GetList methods* on page 156 for additional information.

        }
    }
```

Update

```
Update(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectData)
```

Updates the supplied RedirectData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Redirect ID
- Redirect Code
- Original URL
- New URL
- Active

Parameters

- `data`. The RedirectData object to update.

Returns

Updated the RedirectData object.

Remarks

Validate the redirect item with `GetItem()` before you update the properties. Then, call `Update` with your modified RedirectData object.

NOTE: You cannot change all properties after the initial Add event, such as the RedirectData.Type.

```

Data Classes

RedirectCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Constructors

- `RedirectCriteria()`

```
public RedirectCriteria()
```

- `RedirectCriteria (Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectProperty, EkEnumeration.OrderByDirection)`

```
public RedirectCriteria
(Ektron.Cms.Settings.UrlAliasing.DataObjects.RedirectProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `RedirectProperty` are:

- Active
- Id
- SiteId
- SourceURL
- StatusCode
- Target

RedirectData

Namespace

```
Ektron.Cms.Settings.UrlAliasing.DataObjects
```

Properties

- `Active`

```
public bool Active { set; get; }
```

- `Id`

```
public long Id { set; get; }
```

- `SiteId`

```
public long SiteId { set; get; }
```

- `SourceURL`

```
public string SourceURL { set; get; }
```

- `StatusCode`

```
public System.Net.HttpStatusCode StatusCode { set; get; }
```

- `TargetURL`

```
public string TargetURL { set; get; }
```

RegExAliasManager

8.50 and higher

The RegExAliasManager class manages regular expressions that replace URLs that cannot be read. See *Creating RegEx Expressions* in Creating User-Friendly URLs with Aliasing in the Ektron Reference for information about RegEx expressions.

Namespace

```
Ektron.Cms.Framework.Settings.UrlAliasing.RegExAliasManager
```

Constructors

- `RegExAliasManager()`
- `RegExAliasManager(ApiAccessMode)`

Properties

- `ApiMode`. Gets or sets the current API access mode. If set to `Admin`, the API runs with the permissions of an administrator.
- `ApplicationPath`. 9.00 and higher Gets the application path to the Workarea.
- `ContentLanguage`. Gets or sets the current content language.
- `InPreviewMode`. Gets or sets the preview mode and returns true if the site is in preview mode.
- `IsCommerceEnabled`. 8.70 and higher Checks for a commerce license.
- `RegExAliasManagerService`. Returns an instance of the business objects manager service.
- `RequestInformation`. Gets information about the current request.
- `SitePath`. Gets the site path.
- `UserId`. Gets or sets the ID of the currently logged-in user.

Methods

Add

```
Add(Ektron.Cms.Common.UrlAliasRegExData)
```

Adds an item based on information in an UrlAliasRegExData object. The method populates the message.Id with the newly created ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Expression Name
- * Expression
- * Expression Map
- * Example
- Is Enabled
- Priority

Parameters

- `data`. The UrlAliasRegExData object to add.

Returns

Returns the custom CmsData object added.

.aspx.cs code-behind namespace

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
using Ektron.Cms.Framework.Settings.UrlAliasing;
```

.aspx.cs code-behind method

```
protected void uxSubmit_Click(object sender, EventArgs e)
    {
        try
        {
            RegExAliasManager regExAliasManager = new RegExAliasManager();
            regExAliasManager.ClearCache();
```

```
            MessageUtilities.UpdateMessage(uxMessage, "Cache Cleared",
Message.DisplayModes.Success);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
        catch (Exception ex)
        {
            MessageUtilities.UpdateMessage(uxMessage, ex.Message,
Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Delete

```
Delete(System.Int64)
```

Deletes an item (UrlAliasRegExData) from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the UrlAliasRegEx to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

GetItem

```
GetItem(Ektron.Cms.UrlAliasRegExData)
```

Retrieves the properties of a specific UrlAliasRegExData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID

Parameters

- `id`. ID of the UrlAliasRegEx to retrieve.

Returns

UrlAliasRegExData.

```

GetList

```
GetList(Ektron.Cms.UrlAliasing.RegExAliasCriteria)
```

Retrieves a list of UrlAliasRegExData objects based upon the supplied criteria.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- RegEx Alias Property
- * Object Value

Parameters

- `criteria`. RegExAliasCriteria used to retrieve UrlAliasRegExData.

Returns

A list of UrlAliasRegExData.

See *Criteria use for GetList methods* on page 156 for additional information.

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }
    }
```

Update

```
Update(Ektron.Cms.Common.UrlAliasRegExData)
```

Updates an existing item based on information in an UrlAliasRegExData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * ID
- * Expression Name
- * Expression
- * Expression Map
- * Example
- Is Enabled
- Priority

Parameters

- `data`. The UrlAliasRegExData object to update.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the message with `GetItem()` before you update the properties. Then, call `Update` with your modified UrlAliasRegExData object.

NOTE: You cannot change all properties after the initial Add event, such as the UrlAliasRegExData .Type.

Data Classes

RegExAliasCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.UrlAliasing
```

Constructors

- `RegExAliasCriteria()`

```
public RegExAliasCriteria()
```

- `RegExAliasCriteria(Ektron.Cms.UrlAliasing.RegExAliasProperty, EkEnumeration.OrderByDirection)`

```
public RegExAliasCriteria(Ektron.Cms.UrlAliasing.RegExAliasProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `RegExAliasProperty` are:

- Expression
- ExpressionMap
- ExpressionName
- Id
- IsEnabled
- SiteId
- SortOrder
- TransformedUrl

UrlAliasRegExData

Namespace

```
Ektron.Cms
```

Properties

- `Expression`. Gets or sets the regular expression to be used.

```
public string Expression { set; get; }
```

- `ExpressionMap`. Gets or sets the destination for the expression.

```
public string ExpressionMap { set; get; }
```

- `ExpressionName`. Gets or sets a descriptive name for the expression.

```
public string ExpressionName { set; get; }
```

- `IsEnabled`. Gets or sets whether the expression is active.

```
public bool IsEnabled { set; get; }
```

- `Priority`. Gets or sets the look up order for the expression list. Priorities are:
  - None
  - High
  - Medium
  - Low

```
public EkEnumeration.RegExPriority Priority { set; get; }
```

- `RegExId`. Gets the unique ID generated for each record.

```
public long RegExId { set; get; }
```

- `SiteId`. Gets or sets the root folder ID of the site. Returns zero if no site is specified.

```
public long SiteId { set; get; }
```

- `TimeStamp`

```
public System.DateTime TimeStamp { set; get; }
```

- `TransformedUrl`. Gets or sets a sample of how the ExpressionMap URL will look.

```
public string TransformedUrl { set; get; }
```

- `UrlAliasRegExData()`

```
public UrlAliasRegExData()
```

- `UrlAliasRegExData(string, long, string, string)`

```
public UrlAliasRegExData(string expressionName,
  long siteId, string expression, string expressionMap)
```

- `UrlAliasRegExData(string, long, string, string, long, string, bool, EkEnumeration.RegExPriority, System.DateTime)`

```
public UrlAliasRegExData(string expressionName,
  long siteId, string expression, string expressionMap,
  long regexId, string transformedUrl, bool isEnabled,
  EkEnumeration.RegExPriority priority, System.DateTime timeStamp)
```

User

8.50 and higher

The User manager category manages user information and has the following classes:

- *UserGroupManager* on the next page. Manages groups.
- *UserManager* on page 1854. Manages users.

UserGroupManager

8.50 and higher

The UserGroupManager class manages groups. See Managing Users and User Groups in the Ektron Reference for information about managing users and user groups in Ektron.

Namespace

```
Ektron.Cms.Framework.User.UserGroupManager
```

Constructors

- `UserGroupManager()`
- `UserGroupManager(ApiAccessMode)`

Properties

- `UserGroupService`. Returns an instance of the business objects user service.

Methods

- *Add* below
- *AddUser* on page 1832
- *Delete* on page 1834
- *DeleteUser* on page 1835
- *GetItem* on page 1838
- *GetList* on page 1839
- *GetListForUser (list of groups)* on page 1842
- *GetListForUser (all groups)* on page 1845
- `GetUserList(Int64)`. 8.60 and higher Returns list of users that belongs to the user group.
- *IsUserInGroup* on page 1847
- *Update* on page 1849

Add

```
Add(Ektron.Cms.UserGroupData)
```

Adds a user group with details from the supplied UserGroupData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Group Name

Parameters

- `userGroup`. The UserGroupData object to add to the CMS.

Returns

Added UserGroupData object.

        }

    }
```

AddUser

```
AddUser(System.Int64,System.Int64)
```

Add a user to a group.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Group ID
- * User ID

Parameters

- `groupId`. ID of the group.
- `userId`. ID of the user.

.aspx code snippet

```
<ol class="formFields">
        <li class="clearfix">

```

GetItem

```
GetItem(Ektron.Cms.UserGroupData)
```

Retrieves the properties of a specific UserGroupData object.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Group ID

Parameters

- `id`. ID of the user group to get.

Returns

UserGroup details in a UserGroupData object.

GetList

```
GetList(Ektron.Cms.UserGroupCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- User Group Property
- * Object Value

Parameters

- `criteria`. UserGroupCriteria used to specify, or filter, the user groups to return.

Returns

A list of user groups.

See *Criteria use for GetList methods* on page 156 for additional information.

GetListForUser (list of groups)

```
GetListForUser(Ektron.Cms.UserGroupCriteria)
```

Retrieves a list of groups to which a user belongs.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- User Group Property
- * Object Value
- User ID

Parameters

- `userId`. ID of the user.
- `orderBy`. Indicates the group order.

Returns

A list of user groups.

    }
```

GetListForUser (all groups)

```
GetListForUser(System.Int64,Ektron.Cms.Common.EkEnumeration.GroupOrderBy)
```

Retrieves all of the groups to which a user belongs.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID

Parameters

- `userId`. ID of the user.
- `criteria`. Used to specify, or filter, the user groups to return.

Returns

Returns a list of user groups.

            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

Update

```
Update(Ektron.Cms.UserGroupData)
```

Updates an existing UserGroupData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Group ID
- User Group Name
- Display Name

Parameters

- `userGroup`. The UserGroupData object to update in the CMS.

Returns

Updated UserGroupData object.

Remarks

Validate the user group item with `GetItem()` before you update the properties. Then, call `Update` with your modified UserGroupData object.

NOTE: You cannot change all properties after the initial Add event, such as the UserGroupData.Type.

Data Classes

UserGroupCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms
```

Properties

- `UserGroupCriteria()`

  ```
  public UserGroupCriteria()
  ```

- `UserGroupCriteria(Ektron.Cms.Common.UserGroupProperty, EkEnumeration.OrderByDirection)`

  ```
  public UserGroupCriteria(Ektron.Cms.Common.UserGroupProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `UserGroupProperty` are:

  - CommunityGroupId
  - Domain
  - GroupType
  - Id
  - IsMembershipGroup
  - Name

UserGroupData

Namespace

```
Ektron.Cms
```

Properties

- `DisplayUserName`

  ```
  public string DisplayUserName { set; get; }
  ```

- `Domain`. Gets or sets the domain of the UserGroup for the UserGroupData object. Returns the UserGroup's domain.

  ```
  public string Domain { set; get; }
  ```

- `Email`

  ```
  public string Email { set; get; }
  ```

- `FirstName`

  ```
  public string FirstName { set; get; }
  ```

- `GroupDisplayName`. Gets or sets the UserGroup display name for the UserGroupData object. Returns the UserGroup's Display Name.

  ```
  public string GroupDisplayName { set; get; }
  ```

- `GroupDomain`

  ```
  public string GroupDomain { set; get; }
  ```

- `GroupId`

  ```
  public long GroupId { set; get; }
  ```

- `GroupName`. Gets or sets the name of the UserGroup for the UserGroupData object. Returns the UserGroup's name.

  ```
  public string GroupName { set; get; }
  ```

- `GroupPath`. Gets or sets the path of the UserGroup for the UserGroupData object. Returns the UserGroup's path.

  ```
  public string GroupPath { set; get; }
  ```

- `GroupType`. Gets or sets the Group Type, CMSGroup, MembershipGroup, CommunityGroup, or FriendGroup. Returns a group type integer. Use the `UserGroupProperty.GroupType` for conversion and lookup.

  ```
  public int GroupType { set; get; }
  ```

- `Id`. Gets or sets the Id of the UserGroup for the UserGroupData object. Returns the UserGroup's long ID.

  ```
  public override long Id { set; get; }
  ```

- `IsMemberShipGroup`. Gets or sets whether the UserGroup for the UserGroupData object is a CMS UserGroup or a Membership group.
  - True = UserGroup for the UserGroupData object is a Membership group.
  - False = UserGroup for the UserGroupData object is a CMS UserGroup.

  ```
  public bool IsMemberShipGroup { set; get; }
  ```

- `IsMemberShipUser`

```
public bool IsMemberShipUser { set; get; }
```

- `LastName`

```
public string LastName { set; get; }
```

- `Name`. Gets or sets the name of the UserGroup for the UserGroupData object. Returns the UserGroup's name.

```
public string Name { set; get; }
```

- `UserCount`. Gets or sets the number of users in the UserGroup for the UserGroupData object.

```
public int UserCount { set; get; }
```

- `UserGroupDescription`. Gets or sets the user group description

```
public string UserGroupDescription { set; get; }
```

- `UserId`

```
public long UserId { set; get; }
```

- `UserName`

```
public string UserName { set; get; }
```

UserManager

8.50 and higher

The UserManager class manages users. See Managing Users and User Groups in the Ektron Reference for information about managing users and user groups in Ektron.

Namespace

```
Ektron.Cms.Framework.User.UserManager
```

Constructors

- `UserManager()`
- `UserManager(ApiAccessMode)`

Properties

- `UserService`. Returns an instance of the business objects user service.

Methods

- *ActivateUserAccount (account ID)* on the facing page
- *ActivateUserAccount (user)* on page 1857
- *ActivateUserAccounts (user ID)* on page 1859
- *Add* on page 1861
- *AssignTaxonomy* on page 1864
- *Authenticate* on page 1866
- *UserManager* above
- *CanViewUserProfile* on page 1868
- *Delete* on page 1871
- `GetCustomPropertyList()`. Gets the list of all user custom properties.
- *GetItem (authentication)* on page 1873
- *GetItem (ID)* on page 1875
- `GetItem(Int64,Boolean,Boolean)`. 9.00 and higher Returns details of a user.
- *GetItem (properties)* on page 1877
- *GetList (property)* on page 1879
- *GetList (taxonomy)* on page 1882
- *GetList (user)* on page 1885
- `LockUser(Int64)`. 8.60 and higher Locks the user account by user ID.
- *Login (automatic)* on page 1888

- *Login (user)* on page 1890
- `Logout()`. Log out the current user.

  NOTE: The user will need to refresh the page.

- *RemoveTaxonomy* on page 1892
- `ResetPassword(String,Int64)`. 8.60 and higher Resets the membership user password by user name and message ID. You can specify which workarea-managed message you want to use. For example, you could have a different reset password message for your intranet versus internet sites. The messages are managed in **Workarea > Settings > Community Management > Messages**.
- `ResetPassword(String,String,String)`. 8.60 and higher Resets the user password by user name, old password and new password.
- `UnlockUser(Int64)`. 8.60 and higher Unlocks the user account by user ID.
- *Update* on page 1893

ActivateUserAccount (account ID)

8.60 and higher

```
ActivateUserAccount(System.String,System.String)
```

Activates a deactivated user into the current or active state using the username and account ID.

Background Information

Ektron supports 2 types of users:

- CMS users (licensed authors)
- Membership users (site members)

You can configure Ektron so that self-registering membership users must be validated by a site manager/moderator before they can use their account. ActivateUserAccount verifies and activates a membership account.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name
- * Account ID

Parameters

- `userName`. The user name login for the user.
- `accountId`. The account ID for the user.

.aspx code snippet

    }

    }
```

ActivateUserAccount (user)

8.60 and higher

```
ActivateUserAccount(System.String,System.String)
```

Activates a deactivated user into the current or active state using the user ID.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name

Parameters

- `userId`. A unique ID to activate.

```

Authenticate

Authenticate a user:

```
Authenticate(System.String,System.String)
```

Authenticate a user in a specific domain:

```
Authenticate(System.String,System.String,System.String)
```

Retrieves an authentication token that you can use to authenticate the user in a particular domain. WCF headers pass the authentication token to the application tier.

NOTE: Authenticate is used only in 3-Tier deployments.

In 2-Tier deplolyments, if you need to run an API using elevated permissions, you can initialize the API to put it into "Internal Admin" mode.

```
var UserCRUD = new UserManager(Ektron.Cms.Framework.ApiAccessMode.Admin);
```

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User Name
- * Password
- Domain (Optional for user in a specific domain)

Parameters

- `userName`. The user name of user to validate.
- `password`. The user's password.
- `domain`. Optional: The domain to validate.

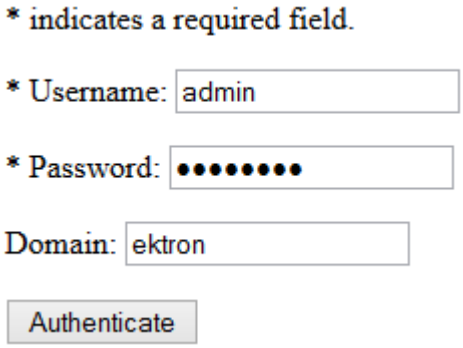
Returns

An authentication token. If authentication fails, an empty string is returned.

NOTE: Authenticate does not log the user into the CMS. Use the *Login (user)* on page 1890 method to log in a user.

.aspx code snippet

```
<asp:Panel ID="uxAuthenticateForm" runat="server" DefaultButton="uxAuthenticate">
    <p>
        * indicates a required field.
    </p>
    <p>
        * Username:
        <asp:TextBox ID="uxUsername" runat="server" />
    </p>
    <p>
        * Password:
        <asp:TextBox ID="uxPassword" runat="server" TextMode="Password" />
    </p>
    <p>
        Domain:
        <asp:TextBox ID="uxDomain" runat="server" />
    </p>
    <p>
        <asp:Button ID="uxAuthenticate" runat="server" Text="Authenticate"
OnClick="uxAuthenticate_Click" />
    </p>
</asp:Panel>
<asp:Panel ID="uxAuthenticateFail" runat="server" Visible="false">
    Authentication failed for the supplied username, password, and domain.
</asp:Panel>
<asp:Panel ID="uxAuthenticateSuccess" runat="server" Visible="false">
    Your Authentication Token is: <asp:Literal ID="uxToken" runat="server" />
</asp:Panel>
```



Pass: `Your Authentication Token is: 5c80b4dc7a9947949c749f7ae54319d1`

Fail: `Authentication failed for the supplied username, password, and domain.`

.aspx.cs code-behind method

```
protected void uxAuthenticate_Click(object sender, EventArgs e)
{
    uxAuthenticateForm.Visible = false;
    var UserCRUD = new Ektron.Cms.Framework.User.UserManager();
    string Token = UserCRUD.Authenticate(uxUsername.Text, uxPassword.Text,
uxDomain.Text);
    if (!string.IsNullOrEmpty(Token)) // Success
    {
        uxAuthenticateSuccess.Visible = true;
        uxToken.Text = Token;
    }
    else // Fail
    {
        uxAuthenticateFail.Visible = true;
    }
}
```

Sample Token Use

```
private void UpdateContent(Ektron.Cms.ContentData ContentToUpdate, string
AuthenticationToken)
{
    var ContentCRUD = new Ektron.Cms.Framework.Content.ContentManager();
    if (!string.IsNullOrEmpty(AuthenticationToken))
    {
        string originalToken = ContentCRUD.RequestInformation.AuthenticationToken;
        try
        {
            ContentCRUD.RequestInformation.AuthenticationToken = AuthenticationToken;
            ContentCRUD.Update(ContentToUpdate);
        }
        catch (Exception ex)
        {
            Ektron.Cms.EkException.LogException(ex);
        }
        finally
        {
            ContentCRUD.RequestInformation.AuthenticationToken = originalToken;
        }
    }
}
```

CanViewUserProfile

```
CanViewUserProfile(System.Int64,System.Int64)
```

Returns true if the viewer (viewerId) can view the other users profile (userid).

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Viewer ID

Parameters

- `userId`. ID of user's profile to view.
- `viewerId`. ID of user trying to view profile.

.aspx code snippet

Delete

```
Delete(System.Int64)
```

Deletes a user (using the UserData object) from the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID

Parameters

- `id`. ID of the user to delete.

Remarks

Validate the item with `GetItem()` before deleting it.

        }

    }
```

GetItem (authentication)

```
GetItem(System.Int64,System.String)
```

Retrieves details of a user, based on an authentication type and authentication user ID.

Authentication Types represent third-party integrations for authenticating users. For example, `AuthenticationTypeId = 1` is Facebook integration and the `authenticationUserId` in this case would be the users Facebook ID. So `GetItem (1, '1111111111')` would return the CMS user who logs in through Facebook and has the Facebook ID '1111111111'.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Authentication Type ID
- Authentication User ID

Parameters

- `authenticationTypeId`. ID of authentication type user is associated with.
- `authenticationUserId`. ID of user based on authentication type.

Returns

User details in a UserData object.

GetList (taxonomy)

```
GetList(Ektron.Cms.User.UserTaxonomyCriteria)
```

Retrieves lists of objects.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- User Property
- * Object Value

Parameters

- `criteria`. UserTaxonomyCriteria used to specify, or filter, the users to return.

Returns

A list of users.

See *Criteria use for GetList methods* on page 156 for additional information.

```

Login (automatic)

```
Login(System.Int64,System.String)
```

Automatically logs in a user based on an authentication type and authentication user ID.

NOTE: Prior to Ektron 9.40 SP1, this method required you to run `setAuthenticationCookie` (with name `ecm...`) after calling it. In Ektron 9.40 SP1, this is done for you.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Authentication Type ID
- * Authentication User ID

Parameters

- `authenticationTypeId`. ID of authentication type user is associated with.
- `authenticationUserId`. ID of user based on authentication type.

        }

    }
```

Login (user)

```
Login(System.String,System.String,System.String)
```

Logs in a user.

NOTE: Prior to Ektron 9.40 SP1, this method required you to run `setAuthenticationCookie` (with name `ecm`..) after calling it. In Ektron 9.40 SP1, this is done for you.

NOTE: In Ektron 8.6, this method was modified to generate an error if a user cannot successfully log in. (Previous to 8.6, Login returned an empty UserData object on unsuccessful login attempts, which left the developer unaware of what happened or why it happened.)

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * Username
- * Password

Parameters

- `userName`. User name of user to login.
- `password`. User's password.

- `domain`. Name of domain the user is logging in to. This parameter is only applicable for AD and LDAP configurations.

        }

    }
```

RemoveTaxonomy

```
RemoveTaxonomy(System.Int64,System.Int64)
```

Removes a user taxonomy from a category.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- * Taxonomy ID

Parameters

- `userId`. ID of the user.
- `categoryId`. ID of the category.

.aspx code snippet

```
<ol class="formFields">
        <li class="clearfix">
```

```
            <ektronUI:Label ID="uxUserIdLabel" AssociatedControlID="uxUserId"

Message.DisplayModes.Error);
            uxPageMultiView.SetActiveView(uxViewMessage);
        }

    }
```

Update

```
Update(Ektron.Cms.UserData)
```

Updates an existing UserData object in the CMS.

Authenticated users

- CMS Administrators

To create anonymous user access with this method, set the API access mode (`ApiMode`) in the Manager class when instantiating the class.

Fields

*=Required

- * User ID
- User Name
- * Password
- First Name
- Last Name
- Display
- Email

Parameters

- `userData`. The UserData object to update in the CMS.

Returns

Returns the custom CmsData object updated.

Remarks

Validate the user item with `GetItem()` before you update the properties. Then, call `Update` with your modified UserData object.

NOTE: You cannot change all properties after the initial Add event, such as the UserData.Type.

Data Classes

UserCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.User
```

Properties

- `ReturnCustomeProperties`. Gets or sets the `ReturnCustomProperties` flag. If true, each user's custom properties also will be returned with results.

  ```
  public bool ReturnCustomProperties { set; get; }
  ```

- `UserCriteria()`

  ```
  public UserCriteria()
  ```

- `UserCriteria(Ektron.Cms.User.UserProperty, EkEnumeration.OrderByDirection)`

  ```
  public UserCriteria(Ektron.Cms.User.UserProperty
    orderByField, EkEnumeration.OrderByDirection orderByDirection)
  ```

  Accepted fields for the `UserProperty` are:

  - AcceptedTerms
  - Address
  - AddressName
  - AuthenticationTypeId
  - AuthenticationUserId
  - AuthGuid
  - Avatar
  - DateCreated

- DisplayName
- DisplayUserName
- Domain
- EditorOpen
- Email
- FirstName
- Id
- IsActivated
- IsDeleted
- IsDisableMessage
- IsMemberShip
- LanguageId
- LastLoginDate
- LastName
- Latitude
- LoginAttempts
- LoginIdentification
- Longitude
- Path
- Signature
- UserName
- VerifyGuid

UserCustomPropertyCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.User
```

Properties

- `AddFilter(string, Ektron.Cms.Common.CriteriaFilterOperator, object)`. Adds a Custom property based filter to the criteria object and returns the `UserCustomPropertyFilterGroup` that was created.

```
public Ektron.Cms.User.UserCustomPropertyFilterGroup
  AddFilter(string propertyName,
  Ektron.Cms.Common.CriteriaFilterOperator
  filterOperator, object value)
```

- `AddFilter(long, Ektron.Cms.Common.CriteriaFilterOperator, object)`. Adds a custom property based filter to the criteria object and returns the `UserCustomPropertyFilterGroup` that was created.

```
public Ektron.Cms.User.UserCustomPropertyFilterGroup
  AddFilter(long propertyId,
```

```
  Ektron.Cms.Common.CriteriaFilterOperator
  filterOperator, object value)
```

- `CustomPropertyFilterGroups`

```
public System.Collections.Generic.List<UserCustomPropertyFilterGroup>
  CustomPropertyFilterGroups { set; get; }
```

- `GenerateSql(System.Data.Common.DbCommand, System.Collections.Generic.Dictionary<Ektron.Cms.User.UserProperty,string>, out string, out string)`

```
public override void GenerateSql(System.Data.Common.DbCommand command,
  System.Collections.Generic.Dictionary<UserProperty,string>
  columnMap, out string whereClause, out string orderByClause)
```

- `ToCacheKey()`

```
public override string ToCacheKey()
```

- `UserCustomPropertyCriteria()`

```
public UserCustomPropertyCriteria()
```

- `UserCustomPropertyCriteria(Ektron.Cms.User.UserProperty, EkEnumeration.OrderByDirection)`

```
public UserCustomPropertyCriteria(Ektron.Cms.User.UserProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

Accepted fields for the `UserProperty` are:

- AcceptedTerms
- Address
- AddressName
- AuthenticationTypeId
- AuthenticationUserId
- AuthGuid
- Avatar
- DateCreated
- DisplayName
- DisplayUserName
- Domain
- EditorOpen
- Email
- FirstName
- Id
- IsActivated
- IsDeleted
- IsDisableMessage
- IsMemberShip
- LanguageId
- LastLoginDate

- LastName
- Latitude
- LoginAttempts
- LoginIdentification
- Longitude
- Path
- Signature
- UserName
- VerifyGuid

UserData

Namespace

```
Ektron.Cms
```

Properties

- `AcceptedTerms`. Gets or set whether the user has accepted the Terms and Conditions associated with a Threaded Discussion. This is for the UserData object. Returns boolean indicating whether the user has accepted the Terms and Conditions associated with a Threaded Discussion.

  ```
  public bool AcceptedTerms { set; get; }
  ```

- `Add(string)`. Adds a custom attribute by name

  ```
  public void Add(string sName)
  ```

- `AdUserName`. Obsolete: Gets or sets the Active Directory user name for the UserData object.

  ```
  public string AdUserName { set; get; }
  ```

- `AttributeList`. Gets custom attribute list as array

  ```
  public Ektron.Cms.CustomAttribute[] AttributeList { set; get; }
  ```

- `AuthenticationToken`. Gets or sets the authentication token assigned to this user for non-logged-in authentication purposes.

  ```
  public string AuthenticationToken { set; get; }
  ```

- `AuthenticationTokenExpires`. Gets or sets the datetime when the current authentication token expires.

  ```
  public System.DateTime AuthenticationTokenExpires { set; get; }
  ```

- `AuthenticationTypeId`. Gets or sets the ID of the authentication type this user uses to authenticate against for the CMS. For example, `EkEnumeration.UserAuthenticationType.Facebook` is used for integrated Facebook authentication.

  ```
  public long AuthenticationTypeId { set; get; }
  ```

- `AuthenticationUserId`. Gets or sets the id associated with this user in the third party authentication process. For Example, when `AuthenticationTypeId` is `EkEnumeration.UserAuthenticationType.Facebook`,

AuthenticationUserId would be the user's Facebook User ID.

```
public string AuthenticationUserId { set; get; }
```

- AuthGuid. Obsolete: When using a non CMS authentication method, the guid of the user in that system. Example: Active Directory objectGuid.

```
public string AuthGuid { set; get; }
```

- CustomAttribute(string). Gets a customAttribute instance by name

```
public Ektron.Cms.CustomAttribute CustomAttribute(string sName)
```

- CustomProperties. Gets the current users list of custom properties.

```
public Ektron.Cms.CustomAttributeList CustomProperties { set; get; }
```

- DateCreated. Gets or sets the creation date of a user. This is for the UserData object. Returns the date the user was created.

```
public string DateCreated { set; get; }
```

- DateModified. Gets the last modified date of a user. This is for the UserData object. Returns the date the user was last modified.

```
public System.DateTime DateModified { set; get; }
```

- EditorOption. Represents the content editor type configured on this user

```
public string EditorOption { set; get; }
```

- GetCustomAttributes(). Gets Custom attributes

```
public Ektron.Cms.CustomAttributeList GetCustomAtrributes()
```

- GetUserattributes(). Gets all custom attributes for this user and returns a list custom attributes.

```
public Ektron.Cms.CustomAttributeList GetUserAttributes()
```

- GroupId. Obsolete: To retrieve a list of groups this User belongs to use Ektron.Cms.API.User.GetAllUserGroups() function. Gets or sets the numeruc ID (Long) of the group to which the user belongs. This is for the UserData object. Returns the group ID to which the user belongs.

```
public long GroupId { set; get; }
```

- GroupName. Obsolete: To retrieve a list of groups this User belongs to use Ektron.Cms.API.User.GetAllUserGroups() function. Gets or sets the numeric ID (Long) of the group to which the user belongs. This is for the UserData object. Returns the name of the group to which the user belongs.

```
public string GroupName { set; get; }
```

- IsAccountLocked(EkRequestInformation). Gets a flag that indicates whether this account is locked or not and returns true when account is locked; false when not.

```
public bool IsAccountLocked(EkRequestInformation reqInfo)
```

- IsDeleted. Gets or sets a boolean flag that indicates if the user was deleted.

```
public bool IsDeleted { set; get; }
```

- IsDisableMessage. Gets or sets a flag that indicates whether messaging is enabled or disabled for this user.

```
public bool IsDisableMessage { set; get; }
```

- `IsMemberShip`. Gets or sets a boolean indicating whether the user is a Membership user or not. This is for UserData object. Returns a boolean indicating whether the user is a Membership user.

```
public bool IsMemberShip { set; get; }
```

- `LanguageId`. Gets or sets the integer ID of the language for the UserData object and returns the integer ID of the language.

```
public int LanguageId { set; get; }
```

- `LanguageName`. Gets the name of the user's language for the UserData object and returns the name of the user's language.

```
public string LanguageName { set; get; }
```

- `LastLoginDate`. Gets or sets the last date a user logged into Ektron CMS. This is for the UserData object. Returns the last login date for a user.

```
public string LastLoginDate { set; get; }
```

- `LastPasswordChangeDate`. Gets or sets the last date a user changed their password. Returns the date when the user last changed the password.

```
public System.DateTime LastPasswordChangeDate { set; get; }
```

- `LoginAttempts`. Gets an Int16 representing the number of times a user has attempted to login for the UserData object. This number resets to 0 (zero) once a user successfully logs in.

```
public short LoginAttempts { set
```

- `LoginIdentification`. Gets or sets a unique login ID

```
public string LoginIdentification { set; get; }
```

- `PasswordExpired(int)`. Gets a boolean representing if the user's password would expire given a certain amount of days from today's date and returns true when password expired; false otherwise.

```
public bool PasswordExpired(int expirationPeriodInDays)
```

- `Path`. Obsolete.

```
public string Path { set; get; }
```

- `Rank`. Gets or sets the user's rank for a Threaded Discussion for the UserData object and returns the user's rank for a Threaded Discussion.

```
public Ektron.Cms.UserRank Rank { set; get; }
```

- `SessionId`. Gets the users current session Id.

```
public System.Guid SessionId { set; get; }
```

- `Signature`. Gets or sets the user's signature for the UserData object, used in the forums and other locations.

```
public string Signature { set; get; }
```

- `UserPreference`. Gets or sets a user's preferences as UserPreferenceData for the UserData object.

```
public Ektron.Cms.UserPreferenceData UserPreference { set; get; }
```

- `Validate()`. Validate this instance's data.

```
public override ValidationResults Validate()
```

UserTaxonomyCriteria

See also *Criteria use for GetList methods* on page 156 for more information.

Namespace

```
Ektron.Cms.User
```

Properties

- `AddFilter(string, [bool])`

```
public Ektron.Cms.User.UserTaxonomyFilterGroup
  AddFilter(string taxonomyPath, [bool recursive = false])
```

- `AddFilter(long, [bool])`

```
public Ektron.Cms.User.UserTaxonomyFilterGroup
  AddFilter(long taxonomyId, [bool recursive = false])
```

- `AddFilter(Ektron.Cms.User.UserTaxonomyProperty, Ektron.Cms.Common.CriteriaFilterOperator, object, [bool])`

```
public Ektron.Cms.User.UserTaxonomyFilterGroup
  AddFilter(Ektron.Cms.User.UserTaxonomyProperty
  taxonomyProperty, Ektron.Cms.Common.CriteriaFilterOperator
  filterOperator, object value, [bool recursive = false])
```

- `GenerateSql(System.Data.Common.DbCommand, System.Collections.Generic.Dictionary<Ektron.Cms.User.UserProperty,string>, out string, out string)`

```
public override void GenerateSql(System.Data.Common.DbCommand command,
  System.Collections.Generic.Dictionary<UserProperty,string>
  columnMap, out string whereClause, out string orderByClause)
```

- `ToCacheKey()`

```
public override string ToCacheKey()
```

- `UserTaxonomyCriteria()`

```
public UserTaxonomyCriteria()
```

- `UserTaxonomyCriteria(Ektron.Cms.User.UserProperty, EkEnumeration.OrderByDirection)`

```
public UserTaxonomyCriteria(Ektron.Cms.User.UserProperty
  orderByField, EkEnumeration.OrderByDirection orderByDirection)
```

  Accepted fields for the `UserProperty` are:

  - AcceptedTerms
  - Address
  - AddressName
  - AuthenticationTypeId
  - AuthenticationUserId
  - AuthGuid
  - Avatar
  - DateCreated

- DisplayName
- DisplayUserName
- Domain
- EditorOpen
- Email
- FirstName
- Id
- IsActivated
- IsDeleted
- IsDisableMessage
- IsMemberShip
- LanguageId
- LastLoginDate
- LastName
- Latitude
- LoginAttempts
- LoginIdentification
- Longitude
- Path
- Signature
- UserName
- VerifyGuid

2

Framework UI

8.50 and higher

The framework user interface (UI) lets you interact with the following Ektron CMS user controls.

- Accordion. Provides vertically tabbed headers to display multiple sections of content.
- Autocomplete. Provides choices in a text field from a pre-populated list of values.
- Blueprint. Implements style standards to define consistent column and line height styles.
- Button. Creates buttons with an input of type `submit`, `reset`, or `anchors` are themable buttons with mouseover and active styles.
- ButtonSet. Groups buttons with their own naming container.
- Css. Lets you associate a Cascading Style Sheet (CSS) to an ASP.NET control.
- CssBlock. Lets you define and apply inline Cascading Style Sheet (CSS) rules inside any ASP.NET control without authoring invalid HTML markup.
- DateField. Creates an input field that allows only a date value that is in a culturally sensitive format.
- DatePicker. Lets you double click to post a date to your page.
- DecimalField. Creates an input field that allows only decimal values.
- Dialog. Creates a floating window that contains a title bar, content area, and dialog buttons.
- InfoTip. 9.00 and higher Initially hides a message and makes it visible "on demand."
- IntegerField. Creates an input field that allows only integers.
- JavaScript. Associates an external file containing JavaScript (JS) code to an ASP.NET control.
- JavaScriptBlock. Lets you define and apply inline JavaScript (JS) rules inside any ASP.NET control without authoring invalid HTML markup.
- Label. Outputs an HTML `<label>` tag that is different than the tag in a standard ASP label control.
- Message. Displays messages to users of an application in a consistent and themable format.
- Pager. Limits the number of items on a page and provide simple navigation to other items.
- Tabs. Provides horizontally tabbed headers to display multiple sections of content.
- TextField. Creates and input field in which you can enter text.
- Tree. 9.00 and higher Renders items that are added declaratively or programatically as a nested unordered-list.

- ValidationMessage. Displays the messages that are set in the associated server control's `ErrorMessage` property.
- Wizard. 9.00 and higher Simplifies the process of creating multi-step, branching user interfaces.

Accordion

8.50 and higher

```
<EktronUI:Accordion>
```

Provides vertically tabbed headers to display multiple sections of content. (See also *Tabs* on page 1979.)

When you click on an accordion tab, the other tabs slide up or down to reveal the content of the selected tab.

Events for Accordion

- `Click`. Set to server side event handler that is called when a user clicks the tab. Must be set on the contained Tab control.
- `Command`. The Command event is raised when the control is clicked. By associating a command name with the control, one method can handle the event from multiple controls, and you can programmatically determine the specific control that triggered the event by examining the event's command name.

Methods for Accordion

- `SetActiveTab(EktronUI.Tab)`. Selects the supplied tab; must be a child of the `<EktronUI:Tabs>` control.
- `SetActiveTab(string)`. Selects the child tab that has the supplied ID.

Theming for Accordion

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxDemoAccordion" class="ektron-ui-control ektron-ui-accordion">
  <div role="tablist" class="ektron-ui-accordion-selectorui-accordion
    ui-widget ui-helper-reset ui-accordion-icons">
    <h3 tabindex="0" aria-selected="true" aria-expanded="true" role="tab"
      id="uxDemoAccordion_uxTab1_AccordionTemplate_aspAccordionHeader"
      class="EktronUI ui-accordion-headerui-helper-reset ui-state-default
      ui-state-active ui-corner-top">
      <span class="ui-icon ui-icon-triangle-1-s"></span>
      <a tabindex="-1" href="#uxDemoAccordion_uxTab1" title="Tab One">
        Tab One
```

```
      </a>
    </h3>
    <div role="tabpanel"
      class="ui-accordion-content ui-helper-reset ui-widget-content
        ui-corner-bottom ui-accordion-content-active">
      <h4>Inside tab one</h4>
        Lorem ipsum dolor sit amet, consectetur adipisicing elit,
        sed do eiusmod tempor incididunt ut labore …
      </div>
    ..
  </div>
</div>
```

Examples for Accordion

Accordion has the following variations:

- **Default Functionality**. Vertical tab controls display grouped content by expanding and collapsing.
- **Active Tab**. Shows the active tab that is set in the code-behind in the page's OnLoad method.
- **Contains Controls**. Clicking on a tab fills a field with postback text. AutoHeight is disabled, which causes each tab to fit their contents rather than adjusting all tabs to the size of the largest.
- **Databind to Add Tabs**. Adds a tab by databinding.
- **Dynamically Add Tabs**. Adds a tab programatically.
- **Postback**. Displays text that is associated with the click event. The Tabs control contains a server-side onclick event handler that generates a postback when clicked.

Default functionality example

.aspx

```
<ektronUI:Accordion ID="uxDemoAccordion" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <h2>Inside tab one</h2>
            <p>Lorem ipsum dolor sit amet, consectetur adipisicing elit,
               sed do eiusmod tempor incididunt ut labore et dolore
               magna aliqua.</p>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <h2>Inside tab two</h2>
            <p>Ut enim ad minim veniam, quis nostrud exercitation
               ullamco laboris nisi ut aliquip ex ea commodo consequat.
               Duis aute irure dolor in reprehenderit in voluptate
               velit esse cillum dolore eu fugiat nulla pariatur.</p>
        </ContentTemplate>
    </ektronUI:Tab>
```

```
    <ektronUI:Tab ID="uxTab3" runat="server" CssClass="EktronUI"
      Text="Tab Three" >
        <ContentTemplate>
            <h2>Inside tab three</h2>
            <p>Excepteur sint occaecat cupidatat non proident,
               sunt in culpa qui officia deserunt mollit anim id
               est laborum.</p>
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Accordion>
```

NOTE: .aspx.cs not required.

Active Tab example

.aspx

```
<ektronUI:Accordion ID="uxDemoAccordion" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <h2>Inside tab one</h2>
            <p>Lorem ipsum dolor sit amet, consectetur adipisicing elit,
               sed do eiusmod tempor incididunt ut labore et dolore
               magna aliqua.</p>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <h2>Inside tab two</h2>
            <p>Ut enim ad minim veniam, quis nostrud exercitation
               ullamco laboris nisi ut aliquip ex ea commodo consequat.
               Duis aute irure dolor in reprehenderit in voluptate
               velit esse cillum dolore eu fugiat nulla pariatur.</p>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab3" runat="server" CssClass="EktronUI" Text="Tab Three" >
        <ContentTemplate>
            <h2>Inside tab three</h2>
            <p>Excepteur sint occaecat cupidatat non proident,
               sunt in culpa qui officia deserunt mollit anim
               id est laborum.</p>
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Accordion>
```

.aspx.cs

```
protected override void OnLoad(EventArgs e)
{
    base.OnLoad(e);
    uxDemoAccordion.SetActiveTab(uxTab2);
}
```

Contains Controls example

.aspx

```
<ektronUI:Accordion ID="uxDemoAccordion" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <ektronUI:TextField ID="uxTextField" runat="server" Text="" />
            <ektronUI:ButtonSet ID="ButtonSet1" runat="server">
                <ektronUI:Button ID="Button1" runat="server"
                  Text="One" DisplayMode="Button" OnClick="Button1_click" />
                <ektronUI:Button ID="Button2" runat="server"
                  Text="Two" DisplayMode="Button" OnClick="Button2_click" />
                <ektronUI:Button ID="Button3" runat="server"
                  Text="Three" DisplayMode="Button" OnClick="Button3_click" />
            </ektronUI:ButtonSet>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <cms:Login ID="login1" runat="server" /><br /><br />
            <cms:ContentBlock ID="cb1" runat="server" DefaultContentID="30" />
            <cms:ListSummary ID="ls1" runat="server" FolderID="78" Recursive="false" />
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Accordion>
```

.aspx.cs

```
protected void Button1_click(object sender, EventArgs e)
{
    uxTextField.Text = "Button one clicked!";
}

protected void Button2_click(object sender, EventArgs e)
{
    uxTextField.Text = "Button two clicked!";
}

protected void Button3_click(object sender, EventArgs e)
{
    uxTextField.Text = "Button three clicked!";
}
```

Databind to Add Tabs example

.aspx

```
<ektronUI:Accordion ID="uxAccordionControl"
   runat="server" CssClass="class_tabs1" ViewStateMode="Enabled" >
        <ektronUI:Tab ID="Tab0" runat="server" Text="Tab 0"
          CssClass="class_tab0">
            <ContentTemplate>
                Tab-Zero (declaratively added)
            </ContentTemplate>
```

```
        </ektronUI:Tab>
    </ektronUI:Accordion>
```

.aspx.cs

```
protected void Page_Init(object sender, EventArgs e) {
        this.SelectedTab = "uxEktronUiTab";
        this.SelectedAccordion = "uxAccordionTab";
        this.SelectedSample = "DatabindTab";
        this.ComponentName = "ektronUI:Accordion";
        this.ComponentUrl =
"/Framework/UI/Controls/EktronUI/Accordion/DatabindTab.aspx.aspx";
        this.IsDemoSafe = true;
        this.DocumentationName = "Ektron.Cms.Framework.UI.Controls.EktronUI.Tabs";
        uxSummary.BaseClasses.Add
("Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.TabsBase");

        LoadTabControls();
    }

    protected void LoadTabControls() {

        var tabs = new TabData[]{
            new TabData(){Text = "Tab 1",
              ContentText="tab one (added by DataBinding)",
              Selected = true},
            new TabData(){Text = "Tab 2",
              ContentText="tab two (added by DataBinding)"},
            new TabData(){Text = "Tab 3",
              ContentText="tab three (added by DataBinding)"}
        };

        uxAccordionControl.DataSource = tabs;
        uxAccordionControl.DataBind();
    }
```

Dynamically Add Tabs example

.aspx

```
<ektronUI:Accordion ID="uxAccordionControl" runat="server" CssClass="class_tabs1">
            <ektronUI:Tab ID="Tab1" runat="server" Text="Tab1" >
                <ContentTemplate>
                    Tab1 (declaratively added)
                </ContentTemplate>
            </ektronUI:Tab>
            <ektronUI:Tab ID="Tab2" runat="server" Text="Tab2" >
                <ContentTemplate>
                    Tab2 (declaratively added)
                </ContentTemplate>
            </ektronUI:Tab>
        </ektronUI:Accordion>
        <br />
    <asp:Literal runat="server" ID="messageLiteral" />
```

.aspx.cs

```
protected void Page_Init(object sender, EventArgs e) {
        this.SelectedTab = "uxEktronUiTab";
        this.SelectedAccordion = "uxAccordionTab";
        this.SelectedSample = "DynamicAddTab";
        this.ComponentName = "ektronUI:Accordion";
        this.ComponentUrl =
"/Framework/UI/Controls/EktronUI/Accordion/DynamicAddTab.aspx";
        this.IsDemoSafe = true;
        this.DocumentationName = "Ektron.Cms.Framework.UI.Controls.EktronUI.Tabs";
        uxSummary.BaseClasses.Add
("Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.TabsBase");

        LoadTabControls();
    }

    protected void LoadTabControls() {
        var tab = new Tab { Text = "Dynamic Tab1", ID = "DynamicTab1",
          Content = "Inside Dynamic Tab1 (added programatically)"};
        uxAccordionControl.AddTab(tab);

        tab = new Tab {Text = "Dynamic Tab2", ID = "DynamicTab2",
          Content = "Inside Dynamic Tab2 (added programatically)"};
        uxAccordionControl.AddTab(tab);
    }
```

Postback example

.aspx

```
<ektronUI:Accordion ID="uxDemoAccordion" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI"
      Text="Tab One" >
        <ContentTemplate>
            Static content... (click the other tab)
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI"
      Text="Tab Two" OnClick="uxTab2_click" >
        <ContentTemplate>
            <b>
                <asp:Literal ID="literal1" runat="server" />
            </b>
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Accordion>
```

.aspx.cs

```
protected void uxTab2_click(object sender, EventArgs e)
{
    uxTab2.Text = "Tab Two (been clicked)";
    uxDemoAccordion.SetActiveTab(uxTab2);
```

```
    literal1.Text = "Content set in code-behind, during click event servicing...)";
}
```

AdaptiveMultiView

9.00 and higher

```
<EktronUI:AdaptiveMultiView>
```

Lets you specify sections of a template that will appear for a specific Device Group. When a page is loaded, the template determines which device group the visitor's device fits into and displays the appropriate view for this control.

This UI control associates each "AdaptiveView" section to one of the Device Groups created in the Workarea (**Workarea > Settings > Configuration > Mobile Settings > View All Device Groups**).

AdaptiveMultiView syntax:

```
<ektronUI:AdaptiveMultiView runat="server" ID="MyMobileControl">
<ektronUI:AdaptiveView ID="AdaptiveView1" runat="server" GroupId="7"
  GroupType="Breakpoint">
    I'm a SmartPhone!
</ektronUI:AdaptiveView>
<ektronUI:AdaptiveView ID="AdaptiveView2" runat="server" GroupId="3"
  GroupType="DeviceGroup">
    I'm a CoolPhone!
</ektronUI:AdaptiveView>
<ektronUI:AdaptiveView ID="AdaptiveView3" runat="server" GroupId="0"
  GroupType="DeviceGroup">
    I'm Generic Mobile!
</ektronUI:AdaptiveView>
<ektronUI:AdaptiveView ID="AdaptiveView4" runat="server" IsDefaultView="true">
    I'm a Default!
</ektronUI:AdaptiveView>
</ektronUI:AdaptiveMultiView>
```

AdaptiveMultiView properties

- **GroupId** (Long)

  Group Id for the Device Group, which is displayed you can find in the table at **Workarea > Settings > Configuration > Mobile Settings > View All Device Groups**. If you set this to 0, GroupID is associated with any device that does not fit into any of the Device Groups created.

  NOTE: If Breakpoint Groups exist, every device will fall into one of these groups, therefore making this "Generic Mobile" group unusable.

- **GroupType** (String)

  Determines whether the group is a Breakpoint Group or a manually created Device Configuration. The possible values for this property are `Breakpoint` or `DeviceGroup`.

- **IsDefaultView** (Boolean)
  Set this value to "true" to display this view for any visitors using a device that doesn't fit into any other group. This view will typically be displayed for any desktop visitors.

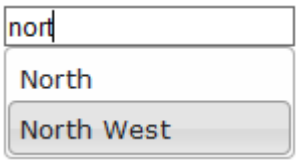
Autocomplete

8.50 and higher

```
<EktronUI:Autocomplete>
```

Provides choices in a text field from a pre-populated list of values. For example, if the field asks for a *State* name in the USA and the user types in `new`, all the states starting with *New* such as *New Hampshire*, *New Jersey*, *New Mexico*, and *New York* appear in a list where a user can use the cursor or mouse to select any of the suggestions. You can narrow the options by entering more characters.

The following example finds values with `nort` in them.



Templates

Theming for Autocomplete

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<span class="ektron-ui-control ektron-ui-autocomplete"
  id="bluePrint_autocomplete">
  <span class="ektron-ui-control ektron-ui-input ektron-ui-textField"
   id="bluePrint_autocomplete_Autocomplete_uxAutocompleteTextBox_
     TextField_uxTextField">
  <input type="text"
   id="bluePrint_autocomplete_Autocomplete_uxAutocompleteTextBox_
     TextField_aspInput"
   name="bluePrint$autocomplete$Autocomplete$uxAutocompleteTextBox
     $TextField$aspInput">
  </span>
</span>
```

Example for Autocomplete

Default functionality example

.aspx

```
<ektronUI:Label runat="server" ID="uxLabel" AssociatedControlID="uxAutoComplete"
Text="Region:" />
<ektronUI:Autocomplete runat="server" ID="uxAutocomplete">
    <SourceData>
        <ektronUI:AutocompleteData Label="North" Value="North" />
        <ektronUI:AutocompleteData Label="South" Value="South" />
        <ektronUI:AutocompleteData Label="East" Value="East" />
        <ektronUI:AutocompleteData Label="West" Value="West" />
        <ektronUI:AutocompleteData Label="North West" Value="North West" />
    </SourceData>
</ektronUI:Autocomplete>
```

NOTE: .aspx.cs not required.

Blueprint

8.50 and higher

```
<EktronUI:Blueprint>
```

Implements style standards to define consistent column and line height styles.

- Provides an easy to use framework for consistent HTML element placements
- Improves UI consistency
- Reduces CSS coding errors
- Eliminates need for HTML tables for layouts
- Provides easy cross-browser support
- Reduces implementation time for projects
- Built-in styles for print and screen

You can use `<EktronUI:Blueprint>` in PageBuilder page layouts. However, you should not use it inside widgets.

From www.blueprintcss.org: "*Blueprint is a CSS framework, which aims to cut down on your development time. It gives you a solid foundation to build your project on top of, with an easy-to-use grid, sensible typography, useful plugins, and even a stylesheet for printing.*"

`<EktronUI:Blueprint>` provides additional functionality to Blueprint classes.

- .NET based server control coding eases developer implementation
- Visual Studio IntelliSense provides prompts for options and classes already defined in Blueprint

`<EktronUI:Blueprint>` by itself is not visible in a browser but it does effect the styles of other elements and controls. Blueprint defines 24 columns of 30px each with a 10 px gutter between columns.

For example, on the Ektron OnTrek home page, under the banner there are three columns. Each column has identical width. Use a class="span-x" tag like this for each column instead of using a CSS width property like the following code snippets.

```
<div class="span-8"></div>
<div class="span-8"></div>
<div class="span-8 last"></div>
```

The class called *span-8* means that this element is contained in 8 of the 24 columns defined by `<EktronUI:Blueprint>`. An additional class called *last* is added to the right side column.

`<EktronUI:Blueprint>` also defines typography standards so that text and other UI objects like text boxes or buttons line up across columns. With proper style classes from `<EktronUI:Blueprint>`, you can align various tags such as `<h1>`, `<h4>`, `<p>` in a grid. (See http://blueprintcss.org/tests/parts/grid.html for an example of the Blueprint Grid.)

Events for Blueprint

None.

Methods for Blueprint

None.

Theming for Blueprint

`<EktronUI:Blueprint>` control uses Blueprint CSS Framework. For further deeper information on Blueprint CSS Framework, visit http://www.blueprintcss.org/.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div class="ektron-ui-control
            ektron-ui-blueprint
            container"
   id="bluePrintLayout_uxBodyColumn_phBody_phBody_
      ucbodyColumn_BlueprintColumn1_phDemo_blueprint1">
   <div class="ektron-ui-control
               ektron-ui-blueprintColumn
               span-17 bluePrintColumnClass"
    id="bluePrintLayout_uxBodyColumn_phBody_phBody_
         ucbodyColumn_BlueprintColumn1_phDemo_
         blueprint1_BlueprintColumn_Header">
      <p>HEADER</p>
   </div>
   <div class="ektron-ui-control
               ektron-ui-blueprintColumn
               span-6 colborder"
    id="bluePrintLayout_uxBodyColumn_phBody_phBody_
         ucbodyColumn_BlueprintColumn1_phDemo_
         blueprint1_BlueprintColumn_Body1">
      <div>
         <p>BODY COLUMN 1</p>
         <p>
         Etiam et purus vel dolor interdum venenatis
         nec sit amet tortor. Aliquam aliquam

    </ektronUI:BlueprintColumn>
</ektronUI:Blueprint>
```

NOTE: .aspx.cs not required.

Button

8.50 and higher

```
<EktronUI:Button>
```

Creates buttons with an input of type `submit`, `reset`, or `anchors` are buttons that can be themed with mouseover and active styles. When you use an input of type `button`, `submit` or `reset`, the buttons can have only plain text labels with no icons.

Properties

- `CheckableControlClientID`. Sets the container control's Clientid as the underlying ASP check box or ASP radio button's ID if the display mode of the button control is either radio button or check box.
- `CheckableControlUniqueID`. Sets the container control's Uniqueid as the underlying ASP check box or ASP radio button's ID if the display mode of the button control is either radio button or check box.
- `Checked`. Gets of sets the boolean value for the check box and radio button.
- `ClientEvents`. Gets or sets the client events property for the control.
- `DisplayMode`. Gets or sets the display type of the following input types check box, radio button, submit, and button.
- `Enabled`. Gets or sets a value indicating whether the control can respond to user interaction. Default value is true.
- `IsButtonSet`. Gets a boolean value for whether the current button is part of a button set.
- `Options`. Gets or sets the available options for the control. Options for this control are Disabled, HasJson, Icon, Label, and Text.
- `PrimaryIcon`. Gets or sets the UI ThemeRoller for Primary Icon for a given button, which is displayed left of the text. Does not apply to type button and submit.
- `SecondaryIcon`. Gets or sets the UI ThemeRoller Secondary Icon for a given button, which is displayed right of the text. Does not apply to type button and submit.
- `Selector`. Gets or sets the hierarchical id of the control which can be used in jQuery as a selector.

Events for Button

- `create`. When button is created, this event is triggered.

Methods for Button

None.

Theming for Button

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

Sample markup with Ektron UI CSS Framework classes:

```
<span class="ektron-ui-control ektron-ui-button" id="bluePrint_button">
   <button title="" onclick="" id="bluePrint_button_Button"
     class="ui-button ui-widget ui-state-default ui-corner-all
       ui-button-text-only" role="button">
     <span class="ui-button-text">ButtonText</span>
   </button>
</span>
```

Examples for Button

Button has the following variations:

- **Default Functionality**. Assigned a standard form input field of type button. Use standard ASP Button events to generate client-side or postback events.
- **Check Box**. Styled as a highlighting toggle button with the button widget. The button text comes from the label element associated with the check box.
- **Icons**. Metadata specifies a combination of icon and text.
- **Radio Button**. Shows a set of buttons where only one can be selected (highlighted) at a time.
- **Submit**. A postback of the form is sent for server-side events.
- **Toolbar**. Specifies a mix of check box and radio buttons (for example, for a media player toolbar). See the examples in this section.
- **Update Panel**. The page does a partial post back and the page fields are updated with the values added in text box.

Default functionality example

.aspx

```
<ektronUI:Button ID="uxButton" DisplayMode="Button"
  Text="A Button Element"
  OnClientClick="alert('Button enhances standard form
    elements like button, input of type submit, anchor,
    radio button and checkbox that is themable with
```

```
    appropriate mouseover and active styles.');"
  runat="server" />
```

NOTE: .aspx.cs not required.

Check Box example

.aspx

```
<ektronUI:Button ID="uxCheckBox1" DisplayMode="Checkbox"" runat="server" Text="Option1"
/>
<ektronUI:Button ID="uxCheckBox2" DisplayMode="Checkbox"" runat="server" Text="Option2"
/>
<ektronUI:Button ID="uxCheckBox3" DisplayMode="Checkbox"" runat="server" Text="Option3"
/>
```

NOTE: .aspx.cs not required.

Icons example

.aspx

```
<ektronUI:Button ID="uxIcon" PrimaryIcon="Alert" Text="Icon" runat="server" / >
<ektronUI:Button ID="uxPrimaryIcon" PrimaryIcon="ArrowDiag" Text="Primary Icon"
runat="server" />
<ektronUI:Button ID="uxSecondaryIcon" SecondaryIcon="Alert" Text="Secondary Icon"
runat="server" />
<ektronUI:Button ID="uxPrimarySecondaryIcon" SecondaryIcon="Alert" Text="Primary -
Secondary Icon" runat="server" />
```

NOTE: .aspx.cs not required.

Radio Button example

.aspx

```
<ektronUI:Button ID="uxCheckBox1" DisplayMode="RadioButton"" runat="server"
Text="Option1" >
<ektronUI:Button ID="uxCheckBox2" DisplayMode="RadioButton"" runat="server"
Text="Option2" >
<ektronUI:Button ID="uxCheckBox3" DisplayMode="RadioButton"" runat="server"
Text="Option3" >
```

NOTE: .aspx.cs not required.

Submit example

.aspx

```
<ektronUI:Button ID="uxSubmit" DisplayMode="Submit"" runat="server" Text="Option1" >
<ektronUI:Label ID="uxLabel" unat="server" />
```

NOTE: .aspx.cs not required.

Toolbar example

.aspx

```
<div style="padding: 5px;">
    <span style="padding: 10px 4px;" class="ui-widget-header ui-corner-all">
        <ektronUI:Button ID="uxSeekFirst" DisplayMode="Anchor" Text=""
PrimaryIcon="SeekFirst" runat="server" />
        <ektronUI:Button ID="uxSeekPrevious" DisplayMode="Anchor" Text=""
PrimaryIcon="SeekPrevious" runat="server" />
        <ektronUI:Button ID="uxPlay" DisplayMode="Anchor" Text="" PrimaryIcon="Play"
runat="server" />
        <ektronUI:Button ID="uxStop" DisplayMode="Anchor" Text="" PrimaryIcon="Stop"
runat="server" />
        <ektronUI:Button ID="uxSeekNext" DisplayMode="Anchor" Text=""
PrimaryIcon="SeekNext" runat="server" />
        <ektronUI:Button ID="uxSeemEnd" DisplayMode="Anchor" Text=""
PrimaryIcon="SeekEnd" runat="server" />
    </span>
</div>
```

NOTE: .aspx.cs not required.

Update Panel example

.aspx

```
<ektronUI:CssBlock runat="server" ID="uxCSSBlock">
    <CssTemplate> .listStyle {list-style:none;} </CssTemplate>
</ektronUI:CssBlock>
<ul>
    <li class="listStyle">First Name:
        <asp:TextBox runat="server" ID="aspFirstName"></asp:TextBox>
    </li>
    <li class="listStyle">Last Name:
        <asp:TextBox runat="server" ID="aspLastName"></asp:TextBox>
    </li>
    <li class="listStyle">
        <asp:ScriptManager runat="server" ID="ScriptManager1">
        </asp:ScriptManager>
        <asp:UpdatePanel runat="server" ID="aspUpdatePanel">
            <ContentTemplate>
                <ektronUI:Button runat="server" ID="uxButton" OnClick="uxButton_Click"
    Text="Update Panel Demo">>/ektronUI:Button>
                The First Name is <b>
                    <asp:Label runat="server" ID="lblFirstName"></asp:Label></b>
    and the last name is <b>
                    <asp:Label runat="server" ID="lblLastName"></asp:Label></b>
            </ContentTemplate>
        </asp:UpdatePanel>
    </li>
</ul>
```

.aspx.cs

```
protected void uxButton_Click(object sender, EventArgs e)
{
    lblFirstName.Text = "\"" + aspFirstName.Text +"\"";
    lblLastName.Text = "\"" + aspLastName.Text + "\".";
}
```

ButtonSet

8.50 and higher

```
<EktronUI:ButtonSet>
```

Groups buttons with their own naming container. For example, placing a set of radio buttons inside a `<EktronUI:ButtonSet>` control lets the radio buttons interact within their own group of radio buttons and ignore the behavior of all other radio buttons that might be placed on the template.

You can choose multiple options with a check box or a single option with a radio button.

See also *Button* on page 1922.

See also the following link for more information about *naming containers*.
http://msdn.microsoft.com/en-us/library/system.web.ui.control.namingcontainer.aspx

Events for ButtonSet

Theming for ButtonSet

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

Sample markup with Ektron UI CSS Framework classes

```
<div class="ektron-ui-buttonSet ui-buttonset" id="buttonSet">
   <span autocomplete="off"
      class=" class=”ektron-ui-control ektron-ui-button">
      <input type="checkbox"
      name="buttonSet$uxButton1$Button$aspCheckbox"
      id="buttonSet_uxButton1_Button_aspCheckbox"
      class="ui-helper-hidden-accessible">
   </span>
   <label id="buttonSet_uxButton1_Button_aspCheckboxLabel"
```

```
      for="buttonSet_uxButton1_Button_aspCheckbox"
      aria-pressed="false"
      class="ui-button ui-widget ui-state-default
        ui-button-text-only ui-corner-left"
      role="button" aria-disabled="false">
      <span class="ui-button-text">option1</span>
   </label>

   <span autocomplete="off" class="
      class=”ektron-ui-control ektron-ui-button">
      <input type="checkbox"
      name="buttonSet$uxButton2$Button$aspCheckbox"
      id="buttonSet_uxButton2_Button_aspCheckbox"
      class="ui-helper-hidden-accessible">
   </span>
   <label id="buttonSet_uxButton2_Button_aspCheckboxLabel"
      for="buttonSet_uxButton2_Button_aspCheckbox"
      aria-pressed="false"
      class="ui-button ui-widget ui-state-default
        ui-button-text-only ui-corner-right"
      role="button"
      aria-disabled="false">
      <span class="ui-button-text">option2</span>
   </label>
</div>
```

Examples for ButtonSet

ButtonSet has the following variations:

- **Default Functionality**. Assigned a standard form input field of type button. Use standard ASP Button events to generate client-side or post back events.
- **Update Panel**. The page does a partial post back and the page fields are updated with the values added in text box.

Default functionality example

.aspx

```
<ektronUI:CssBlock ID="CssBlock1" runat="server">
    <CssTemplate>
        .mediaSet {  height:2.35em !important; }
    </CssTemplate>
</ektronUI:CssBlock>
<p>
    The media player tool bar in this example shows play, seek previous, and seek next
        buttons.
</p>
<ektronUI:ButtonSet ID="mediaSet1" runat="server">
    <ektronUI:Button CssClass="mediaSet" ID="uxRewind" PrimaryIcon="SeekPrevious"
DisplayMode="RadioButton" ToolTip="Seek Previous" runat="server" OnClick="uxRewind_
Click" />
    <ektronUI:Button CssClass="mediaSet" ID="uxPlay" PrimaryIcon="Play"
DisplayMode="RadioButton" ToolTip="Play" runat="server" OnClick="uxPlay_Click" />
```

```
    <ektronUI:Button CssClass="mediaSet" ID="uxForward" PrimaryIcon="SeekNext"
DisplayMode="RadioButton" ToolTip="Seek Next" runat="server" OnClick="uxForward_Click"
/>
</ektronUI:ButtonSet>
<asp:Label runat="server" ID="lblButtonSet"></asp:Label>
```

.aspx.cs

```
protected void uxRewind_Click(object sender, EventArgs e)
{
    lblButtonSet.Text = "<b>Rewind</b> option is selected.";
}
protected void uxPlay_Click(object sender, EventArgs e)
{
    lblButtonSet.Text = "<b>Play</b> option is selected.";
}
protected void uxForward_Click(object sender, EventArgs e)
{
    lblButtonSet.Text = "<b>Forward</b> option is selected.";
}
```

UpdatePanel example

.aspx

```
<ektronUI:CssBlock ID="uxMediaSet" runat="server">
    <CssTemplate>
        .mediaSet {  height:2.35em !important; }
    </CssTemplate>
</ektronUI:CssBlock>
<h3>Media Control Bar</h3>
<asp:ScriptManager runat="server" ID="scriptManager"></asp:ScriptManager>
<asp:UpdatePanel runat="server" id="UpdatePanel1">
    <ContentTemplate>
        <ektronUI:ButtonSet ID="mediaSet1" runat="server">
            <ektronUI:Button CssClass="mediaSet"  ID="uxRewind"
DisplayMode="RadioButton" ToolTip="Seek Previous" runat="server" OnClick="uxRewind_
Click"/>
            <ektronUI:Button CssClass="mediaSet"  ID="uxPlay" DisplayMode="RadioButton"
ToolTip="Play" runat="server" OnClick="uxPlay_Click"/>
            <ektronUI:Button CssClass="mediaSet"  ID="uxForward"
DisplayMode="RadioButton" ToolTip="Seek Next" runat="server" OnClick="uxForward_Click"/>
        </ektronUI:ButtonSet>
        <asp:Label runat="server" ID="lblButtonSet"></asp:Label>
    <ContentTemplate>
</asp:UpdatePanel>
```

.aspx.cs

```
protected void uxRewind_Click(object sender, EventArgs e)
{
    lblButtonSet.Text = "<b>Rewind</b> option is selected.";
}
protected void uxPlay_Click(object sender, EventArgs e)
{
```

```
    lblButtonSet.Text = "<b>Play</b> option is selected.";
}
protected void uxForward_Click(object sender, EventArgs e)
{
    lblButtonSet.Text = "<b>Forward</b> option is selected.";
}
```

Captcha

8.70 and higher

```
<EktronUI:Captcha>
```

Creates a Captcha control to ensure Web form submission is from a human and not another computer. The Captcha control has the following properties.

- `AlternateText`. Gets the localized Alt text.
- `BackgroundColor`. Gets or sets the BackgroundColor for the Captcha image.
- `CodeLength`. Gets or sets the CodeLength for the Captcha Image text.
- `CodeType`. Gets or sets the Captcha code type.
- `DefaultTemplate`. Gets the name of the Default Template used for rendering the TextField control.
- `ErrorMessage`. Gets or Sets the error message for incorrect captcha value.
- `FontFamily`. Gets or sets the font family for the Captcha image.
- `ForegroundColor`. Gets or sets the font color for the Captcha image.
- `HandlerPath`. Gets the path the handler used for generate Captcha image.
- `HelpToolTip`. Gets the localized tooltip for help icon.
- `HelpUrl`. Gets or sets the help URL for the help icon.
- `MismatchErrorMessage`. Gets the localized Alt text.
- `RefreshToolTip`. Gets the localized tooltip for refresh icon.
- `Selector`. Gets and Sets the selector of the control.
- `SpeakerToolTip`. Gets the localized tooltip for speech text icon.
- `Text`. Gets or sets the default text.
- `Title`. Gets the localized Title text.
- `Value`. Strongly typed value accessor.
- `Visible`. Gets or Sets the visibility of the control.

Default functionality example

.aspx

```
<ektron:Captcha ID="captcha" runat="server" />
<p><ektronUI:Button ID="btnUI" runat="server"
   DisplayMode="Submit" Text="Submit" ></ektronUI:Button></p>
```

NOTE: .aspx.cs not required.

Css

8.50 and higher

```
<EktronUI:Css>
```

Lets you associate a Cascading Style Sheet (CSS) to an ASP.NET control.

The `<EktronUI:Css>` control offers several advantages over loading CSS statically on template pages and programatically in code.

- **CSS files are sent to the browser once**

  During a request, `<EktronUI:Css>` manages whether a CSS file was already referenced. Subsequent references to the same CSS file are ignored. During an AJAX-Postback inside an ASP UpdatePanel, `<EktronUI:Css>` manages which CSS files are already loaded by the browser. References to a CSS file during and AJAX-Postback are processed only if the CSS file is not already loaded in the browser.

- **CSS files are aggregated**

  To increase performance, CSS files referenced by `<EktronUI:Css>` controls are aggregated into a single file. Any URL references (including background-images), are automatically resolved into fully qualified paths. You may choose to "opt-out" of aggregation by setting the "Aggregate" property on the control to false. `<EktronUI:Css>` that have a Media attribute setting that is not an empty string and CSS that include at-keywords (`@import`, `@media`, and so on) are automatically dis-aggregated. You can switch off CSS aggregation for `<EktronUI:Css>` references by setting the `AllowCssAggregation` key to false in `Ektron.Cms.Framework.UI.Config`.

- **CSS files are minified**

  To increase performance, CSS files reference by `<EktronUI:Css>` controls are minified. Comments are removed except for comments marked as important by the CSS developer. If the compressor cannot minify a CSS file, it logs an error and uses the unminifed version instead.

  Example: `/*! Important Comment */`

  You can switch off CSS minification for `<EktronUI:Css>` references by setting the `AllowCssMinification` key to false in `Ektron.Cms.Framework.UI.Config`.

Examples for Css

Css has the following variations:

- **Default Functionality**. References a CSS file that applies style rules.
- **Update Panel**. You can conditionally load CSS through AJAX by using an UpdatePanel and the Visible property. On the initial page request, set the Visible property to false. On AJAX-postback, set the Visible property to true.

NOTE: If the browser has already loaded the CSS, it will not be loaded a second time. Also, during an AJAX-postback, the CSS is sent to the browser only if the EktronUI Css control is inside an updating UpdatePanel.

Default functionality example

.aspx

```
<p>References a CSS file that applies background-color (black) and text-color (white)
rules to the paragraph below. <p>
<ektronUI:Css ID="uxCss" runat="server"
Path="~/developer/Framework/UI/Controls/EktronUI/Css/demo-ektronui-css.css" />
<asp:HyperLink ID="aspDemoCss" runat="server"
NavigateUrl="~/developer/Framework/UI/Controls/EktronUI/Css/demo-ektronui-css.css">Link
to referenced CSS file</asp:HyperLink>
```

NOTE: .aspx.cs not required.

UpdatePanel example

.aspx

```
<asp:ScriptManager ID="aspSm" runat="server" />
<p>You can conditionally load CSS through AJAX by using an UpdatePanel and the Visible
property.  On the initial page request, set the Visible property to false.  On AJAX-
postback, set the Visible property to true.</p>
<p><b>Note:</b> If the browser has already loaded the CSS, it will not be loaded a
second time. Also, during an Ajax-postback, the CSS is sent to the browser only if the
EktronUI Css control is inside an updating UpdatePanel.</p>
<asp:UpdatePanel ID="aspUpdatePanel" runat="server">
    <ContentTemplate>
        <p class="demo-ektronui-css-update-panel" style="border:1px solid
silver;padding:5px;">Lorem ipsum dolor sit amet, consectetur adipiscing elit. Quisque

{
    protected void Button_Click(object sender, EventArgs e)
    {
        uxCss.Visible = true;
    }
}
```

CssBlock

8.50 and higher

```
<EktronUI:CssBlock>
```

Lets you define and apply inline Cascading Style Sheet (CSS) rules inside any ASP.NET control without authoring invalid HTML markup. The CssBlock control renders its contents inside a `<style>` tag as a child of the `<head>` tag.

DataBinder evaluations may be used to generate dynamic CSS rules.

Events for CssBlock

None.

Methods for CssBlock

None.

Theming for CssBlock

None.

Examples for CssBlock

CssBlock has the following variations:

- **Default Functionality**. Defines inline CSS that applies rules.
- **Dynamic CSS**. The inline CSS rule is data-bound.

Default functionality example

.aspx

```
<p>Defines inline CSS that apply background-color (maroon) and text-color (white) rules
to the paragraph below via a <style> tag added to the <head> tag.</p>
<p class="demo-ektronui-css-block" style="border:1px solid silver;padding:5px;">Lorem
ipsum dolor sit amet, consectetur adipiscing elit. Quisque sollicitudin lacus nec velit
dictum eu dapibus odio convallis. Duis nulla risus, aliquam in pulvinar ut, egestas
vitae lectus. Nulla vitae ornare dolor. Nulla facilisi. Sed semper ante ut mi posuere in
aliquet leo adipiscing. Duis sagittis bibendum pulvinar. Cras ornare quam a nunc
facilisis dictum. Vivamus ornare erat nec orci viverra volutpat.</p>
<ektronUI:CssBlock ID="uxCssBlock" runat="server">
    <CssTemplate>
        p.demo-ektronui-css-block {background-color:Maroon;color:White;}
    </CssTemplate>
</ektronUI:CssBlock>
```

NOTE: .aspx.cs not required.

Dynamic CSS example

.aspx

```
<p>The inline CSS rule defining the background color of paragraph below is DataBound to
a random color generator.</p>
<p class="demo-ektronui-css-block">Lorem ipsum dolor sit amet, consectetur adipiscing
elit. Quisque sollicitudin lacus nec velit dictum eu dapibus odio convallis. Duis nulla
risus, aliquam in pulvinar ut, egestas vitae lectus. Nulla vitae ornare dolor. Nulla
facilisi. Sed semper ante ut mi posuere in aliquet leo adipiscing. Duis sagittis
bibendum pulvinar. Cras ornare quam a nunc facilisis dictum. Vivamus ornare erat nec
orci viverra volutpat.</p>
<ektronUI:CssBlock ID="uxCssBlock" runat="server">
    <CssTemplate>
        p.demo-ektronui-css-block {background-color:<%# this.RandomColor
%>;color:#4c4c4c;border:1px solid silver;padding:5px;}
    </CssTemplate>
</ektronUI:CssBlock>
<ektronUI:Button ID="uxChangeColor" runat="server" DisplayMode="Submit" Text="Generate
Random Background Color" />
```

.aspx.cs

```
public string RandomColor
{
    get
    {
        KnownColor[] colors = (KnownColor[])Enum.GetValues(typeof(KnownColor));
        return Color.FromKnownColor(colors[GetRandomNumber(colors.Length)]).Name;
    }
}

public int GetRandomNumber(int maxValue)
{
    RandomNumberGenerator rng = RNGCryptoServiceProvider.Create();
    byte[] bytes = new byte[4];
    rng.GetBytes(bytes);
    int ranNum = BitConverter.ToInt32(bytes, 0);
    return Math.Abs(ranNum % maxValue);
}
```

DateField

8.50 and higher

```
<EktronUI:DateField>
```

Creates an input field that allows only a date value that is in a culturally sensitive format. `<EktronUI:DateField>` supports international date formats. A prompt appears in the field and disappears when you start to type in a date.

Input is validated using a built-in *DateRule* validator. Input is optional, but you can make it mandatory by adding a *RequiredRule* to the control's *ValidationRules*. The strongly typed (date) value property is the primary means to query or update the field.

Remarks

- An internal DateRule validator is applied by default.
- The value of this field is type*Date*.
- You can find the contents of this field in the Text property as a type*String*.

Events for DateField

None.

Methods for DateField

None.

Theming for DateField

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<span id="uxDateField_DateField_uxDateFieldWrapper"
  class="ektron-ui-control ektron-ui-input ektron-ui-dateField">
  <label class="inFieldLabel" for="uxDateField_DateField_aspInput"
    id="uxDateField_DateField_aspInputLabel">
      m/d/yyyy
  </label>
  <input data-ektron-validationgroup="" id="uxDateField_DateField_aspInput"
    type="text">
</span>
```

```
<label for="uxDateField_DateField_aspInput" id="uxValidationMessage_Label"
  class="ektron-ui-control ektron-ui-validationMessage ektron-ui-hidden ">
</label>
<br>
<span id="uxSubmitButton" class="ektron-ui-control ektron-ui-button">
  <button role="button" class="ui-button ui-widget ui-state-default
    ui-corner-all ui-button-text-only" id="uxSubmitButton_Button"
    title="">
  <span class="ui-button-text">Submit</span>
  </button>
</span>
```

Examples for DateField

DateField has the following variations:

- **Default Functionality**. Replace "m/d/yyyy" with a correctly formatted date (such as "12/12/2012" and blank) and click **Submit** to enter a valid date. Enter a non-valid format (such as "12/12/201" or "2012/12/12") and click **Submit** to cause the field to change color indicating that the entry is not valid.
- **Required DateField**. Replace "m/d/yyyy" with a correctly formatted date (such as "12/12/2012") and click **Submit** to enter a valid date. Enter a non-valid format (such as blank, "12/12/201" or "2012/12/12") and click **Submit** to cause the field to change color indicating that the entry is not valid.

Default functionality example

.aspx

```
<asp:Label id="uxDateFieldLabel" AssociatedControlID="uxDateField" runat="server">Ektron
Date Field:</asp:Label>
<ektronUI:DateField ID="uxDateField" ErrorMessage="Please enter a valid date."
runat="server" ></ektronUI:DateField>
<ektronUI:ValidationMessage ID="uxValidationMessage" AssociatedControlID="uxDateField"
runat="server" />
<br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxDateField.Text;
        // at this point we could use the value with confidence...
    }
}
```

Required DateField example

.aspx

```
<asp:Label id="uxDateFieldLabel" AssociatedControlID="uxDateField" runat="server">Ektron
Date Field:</asp:Label>
<ektronUI:DateField ID="uxDateField" ErrorMessage="Please enter a valid date."
runat="server">
    <ValidationRules>
        <ektronUI:RequiredRule ErrorMessage="A date-value is required!" />
    </ValidationRules>
</ektronUI:DateField>
<ektronUI:ValidationMessage AssociatedControlID="uxDateField"
ID="uxDateFieldValidationMessage" runat="server" /><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

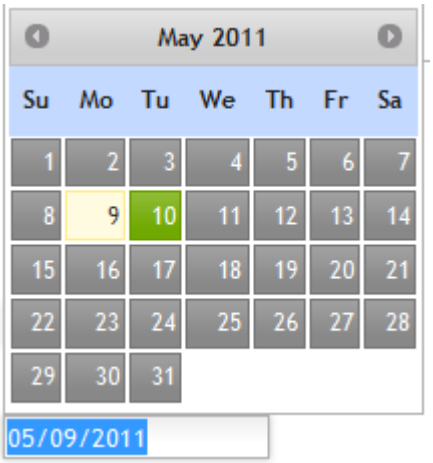
```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxDateField.Text;
        // at this point we could use the value with confidence...
    }
}
```

Datepicker

8.50 and higher

```
<EktronUI:Datepicker>
```

Lets you double click to post a date to your page.



The `<EktronUI:Datepicker>` control uses built in client-side and server-side, culturally sensitive validation to ensure that user input conforms to a valid date format.

You can customize the date format and language, restrict the selectable date ranges, and add buttons and other navigation options. By default, `<EktronUI:Datepicker>` calendar is associated with an input field and opens in a small overlay *onFocus*. It closes automatically *onBlur* or when a date is selected. It can also be displayed inline.

The `<EktronUI:Datepicker>` control provides support for localizing content for other languages and date formats. By default, `<EktronUI:Datepicker>` uses the server's default culture, but you can direct individual instances of the control for another cultural context. For more information about culture settings, see *Setting Up Locales* in the *Working with Multi-Language Content* chapter of the *Ektron Reference*.

Keyboard shortcuts

- **Ctrl/Left**. Previous day
- **Ctrl/Right**. Next day
- **Ctrl/Up**. Previous week
- **Ctrl/Down**. Next week
- **Page Up**. Previous month
- **Page Down**. Next month
- **Ctrl/Page Up**. Previous year
- **Ctrl/Page Down**. Next year
- **Ctrl/Home**. Current month or Open (when closed)

- **Ctrl/End**. Close and erase the date
- **Enter**. Accept the selected data
- **Esc**. Close the calendar without selection

    <button type="button"
       class="ui-datepicker-close ui-state-default
         ui-priority-primary ui-corner-all">Done</button>
  </div>
</div>
```

Examples for Datepicker

DatePicker has the following variations:

- **Default Functionality**. Click on the date field to display a pop-up calendar from which you can select a date. When you click **Submit**, a confirmation message appears. You can type in a date, but it must be in a valid format. For example, enter a non-valid format (such as "12/12/201" or "2012/12/12") and the field changes color indicating that the entry is not valid.
- **Animations**. With the `ShowAnim` property it is possible to use different animations when opening or closing the Datepicker. Choose an animation from the drop-down, then click on the input to see its effect.

- **Date Range**. Click on the From and To date fields to display a pop-up calendar from which you can select a date. You can type in a date, but it must be in a valid format. For example, enter a non-valid format (such as "12/12/201" or "2012/12/12") and the field changes color indicating that the entry is not valid.
- **Display Month and Year Menus**. Show month and year drop-downs in place of the static month/year header to facilitate navigation through large timeframes. Add the boolean `changeMonth` and `changeYear` options.
- **Display Multiple Months**. Set the `numberOfMonths` option to an integer of 2 or more to show multiple months in a single Datepicker.
- **Icon Trigger**. Click the icon next to the input field to show the Datepicker. Set the Datepicker to open on focus (default behavior), on icon click, or both.
- **Inline**. Displays the Datepicker embedded in the page instead of in an overlay.
- **Localization**. The Datepicker's calendar language and format is based on the server's default culture. You can also override the default behavior for each instance of the Datepicker by specifying a culture. For example:
  1. From the Change Current Culture drop down menu, select another culture (for example, French (France) (fr-FR)).
  2. Click on the Date field and select a date from the calendar such as January 23, 2012. The date is displayed as 23/01/2012 (d/m/yyyy).

  The Datepicker also includes built-in support for languages that read right-to-left, such as Arabic and Hebrew.

  NOTE: The select element contains options for supported .NET cultures. If you select a culture that is not supported, Datepicker defaults to "English (United States) (en-US)." You can add translations by creating a new, translated culture file.

- **Restrict Date Range**. Restrict the range of selectable dates with the `minDate` and `maxDate` options. Set the beginning and end dates as actual dates (`new Date(2009, 1 - 1, 26)`), as a numeric offset from today (`-20`), or as a string of periods and units (`+1M +10D`). For the last, use `D` for days, `W` for weeks, `M` for months, or `Y` for years.
- **Show Week of the Year**. The Datepicker can show the week of the year. The default calculation follows the ISO 8601 definition: the week starts on Monday, the first week of the year contains the first Thursday of the year. This means that some days from one year may be placed into weeks 'belonging' to another year.

Default functionality example

.aspx

```
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" runat="server">
    <ValidationRules>
        <ektronUI:RequiredRule ErrorMessage="Please select a date." />
    </ValidationRules>
</ektronUI:Datepicker>
```

```
<ektronUI:ValidationMessage AssociatedControlID="uxDatepicker"
ID="uxDatepickerValidationMessage" runat="server" /><br />
<asp:Literal ID="aspLiteral" runat="server" /><br />
<ektronUI:Button DisplayMode="Button" ID="uxButton" OnClick="uxButton_click"
Text="Submit" runat="server"/>
```

.aspx.cs

```
using System;
using Ektron.Site.Developer;

public partial class Datepicker : SampleControlPage
{
    protected void uxButton_click(object sender, EventArgs e)
    {
        // get the textfield value
        aspLiteral.Text = "You selected " + uxDatepicker.Value.ToLongDateString();
    }
}
```

Animations example

.aspx

```
<p>With the <code>ShowAnim</code> it is possible to use different animations when
opening or closing the datepicker.  Choose an animation from the dropdown, then click on
the input to see its effect.</p>
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" runat="server" />
<ektronUI:Label ID="aspAnimationsLabel" AssociatedControlID="aspAnimations"
runat="server" />
<asp:DropDownList ID="aspAnimations" AutoPostBack="true"
OnSelectedIndexChanged="aspAnimations_change"  runat="server">
    <asp:ListItem Value="show" Text="Show (default)" />
    <asp:ListItem Value="slideDown" Text="Slide Down"/>
    <asp:ListItem Value="fadeIn" Text="Fade in" />
    <asp:ListItem Value="blind" Text="Blind" />
    <asp:ListItem Value="clip" Text="Clip" />
    <asp:ListItem Value="drop" Text="Drop" />
    <asp:ListItem Value="fold" Text="Fold" />
    <asp:ListItem Value="highlight" Text="Highlight" />
    <asp:ListItem Value="pulsate" Text="Pulsate" />
    <asp:ListItem Value="scale" Text="Scale" />
    <asp:ListItem Value="slide" Text="Slide" />
    <asp:ListItem Value="" Text="None" />
</asp:DropDownList>
```

.aspx.cs

```
using System;
using Ektron.Site.Developer;

public partial class Datepicker_RestrictDateRange : SampleControlPage
{
```

```
    protected void aspAnimations_change(Object sender, EventArgs e)
    {
        if (String.IsNullOrEmpty(aspAnimations.Text))
        {
            uxDatepicker.ShowAnim =
Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.DatepickerBase.ShowAnimOptions.none;
        }
        else
        {
            uxDatepicker.ShowAnim =
(Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.DatepickerBase.ShowAnimOptions)Enum.P
arse(typeof
(Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.DatepickerBase.ShowAnimOptions),
aspAnimations.Text, true);
        }
    }
}
```

Date Range example

.aspx

```
<p>Date ranges are easy to accomplish using two datepicker controls in tandem.</p>
<ektronUI:Label ID="uxFrom" AssociatedControlID="uxDatepickerFrom" Text="From"
runat="server" />
<ektronUI:Datepicker ID="uxDatepickerFrom" runat="server" />
<ektronUI:Label ID="uxTo" AssociatedControlID="uxDatepickerTo" Text="to" runat="server"
/>
<ektronUI:Datepicker ID="uxDatepickerTo" runat="server" />
```

NOTE: .aspx.cs not required.

Display Month and Year example

.aspx

```
<p>Show month and year dropdowns in place of the static month/year header to facilitate
navigation through large timeframes.  Add the boolean <code>changeMonth</code> and
<code>changeYear</code> options.</p>
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" DisplayChangeMonth="true"
DisplayChangeYear="true" runat="server" />
```

NOTE: .aspx.cs not required.

Display Multiple Months example

.aspx

```
<p>Set the <code>numberOfMonths</code> option to an integer of 2 or more to show
multiple months in a single datepicker.</p>
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
```

```
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" NumberOfMonths="3" runat="server" />
```

NOTE: .aspx.cs not required.

Icon Trigger example

.aspx

```
<p>Click the icon next to the input field to show the datepicker.  Set the datepicker to
open on focus (default behavior), on icon click, or both.</p>
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" ButtonImageOnly="true" ShowOn="Button"
runat="server" />

<ektronUI:CssBlock ID="uxCssBlock" runat="server">
    <CssTemplate>
        img.ui-datepicker-trigger {vertical-align: middle; cursor: pointer;}
    </CssTemplate>
</ektronUI:CssBlock>
```

.aspx.cs

```
using System;
using Ektron.Cms.Framework.UI;
using Ektron.Cms.Interfaces.Context;
using Ektron.Site.Developer;

public partial class Datepicker_IconTrigger : SampleControlPage
{
    protected void Page_Init(object sender, EventArgs e)
    {
        ICmsContextService cmsContextService = ServiceFactory.CreateCmsContextService();
        uxDatepicker.ButtonImage = cmsContextService.WorkareaPath +
"/images/ui/icons/calendar.png";
    }
}
```

Inline example

.aspx

```
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" DisplayMode="Inline" runat="server" />
```

NOTE: .aspx.cs not required.

Localization example

.aspx

```
<asp:Label ID="aspChangeCultureLabel" AssociatedControlID="aspChangeCulture"
runat="server">Change Current Culture:</asp:Label>
<asp:DropDownList id="aspChangeCulture" name="culture"  AutoPostBack="true"
OnSelectedIndexChanged="aspChangeCulture_change" runat="server"></asp:DropDownList>
<br />
<br />
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" DisplayMode="Default" runat="server" />
```

.aspx.cs

```
using System;
using System.Collections;
using System.Collections.Generic;
using System.Globalization;
using System.Threading;
using System.Web.UI.WebControls;
using Ektron.Site.Developer;

public partial class Datepicker_Localization : SampleControlPage
{
    protected override void OnPreRender(EventArgs e)
    {
        SortDropDown(aspChangeCulture);
        base.OnPreRender(e);
    }

    protected void Page_Init(object sender, EventArgs e)
    {
        Array cultureTypes = CultureInfo.GetCultures(CultureTypes.AllCultures);

        if (!IsPostBack)
        {
            foreach (CultureInfo cultureInfo in cultureTypes)
            {
                ListItem item = new ListItem();
                item.Text = cultureInfo.EnglishName + " (" + cultureInfo.Name + ")";
                item.Value = cultureInfo.Name;
                if (cultureInfo.Name == "en-US")
                {
                    item.Selected = true;
                }
                else
                {
                    item.Selected = false;
                }
                aspChangeCulture.Items.Add(item);
                item = null;
            }
        }
```

```
    }

    protected void aspChangeCulture_change(Object sender, EventArgs e)
    {
        Thread.CurrentThread.CurrentCulture = CultureInfo.CreateSpecificCulture
(aspChangeCulture.SelectedValue);
    }

    #region helpers
    public void SortDropDown(DropDownList cbo)
    {
        List<ListItem> lstListItems = new List<ListItem>();
        foreach (ListItem li in cbo.Items)
        {
            lstListItems.Add(li);
        }
        lstListItems.Sort(new ListItemComparer());
        cbo.Items.Clear();
        cbo.Items.AddRange(lstListItems.ToArray());
    }

    public class ListItemComparer : IComparer<ListItem>
    {

        public int Compare(ListItem x, ListItem y)
        {
            CaseInsensitiveComparer c = new CaseInsensitiveComparer();
            return c.Compare(x.Text, y.Text);
        }
    }
    #endregion
}
```

Restrict Date Range example

.aspx

```
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" MinDate="01/01/2011" MaxDate="09/10/2011"
runat="server" />
```

NOTE: .aspx.cs not required.

Show Week of Year example

.aspx

```
<ektronUI:Label ID="uxDatepickerLabel" AssociatedControlID="uxDatepicker" Text="Date:"
runat="server" />
<ektronUI:Datepicker ID="uxDatepicker" ShowWeek="true" runat="server" />
```

NOTE: .aspx.cs not required.

DecimalField

8.50 and higher

```
<EktronUI:DecimalField>
```

Creates an input field that allows only decimal values.

Numbers are rounded to the nearest specified decimal place. For example, if you specify 2 decimal places (the default) and type 0.337, the number rounds to 0.34.

User-supplied input is validated using the field's built-in *DecimalRule* validator. Input is optional, but you can make it mandatory by adding a *RequiredRule* to the control's *ValidationRules*. The strongly typed (decimal) value property is the primary means to query or update the field.

Events for DecimalField

None.

Methods for DecimalField

None.

Theming for DecimalField

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<span class="ektron-ui-control ektron-ui-input
  ektron-ui-decimalField"
  id="uxDecimalField_DecimalField_uxTextField">
  <span class="ui-spinner ui-state-default ui-widget
    ui-widget-content ui-corner-all">
    <input type="text" autocomplete="off"
      id="uxDecimalField_DecimalField_aspInput"
      value="0.0"
      name="uxDecimalField$DecimalField$aspInput"
      class="ui-spinner-input" role="spinbutton"
      aria-valuemin="-7.922816251426434e+28"
      aria-valuemax="7.922816251426434e+28"
      aria-valuenow="0"
```

```
      data-ektron-initialvalue="0.0"
      data-ektron-validationgroup="" />
    <a class="ui-spinner-button ui-spinner-up
      ui-corner-tr ui-button ui-widget
      ui-state-default ui-button-text-only"
      tabindex="-1" role="button">
      <span class="ui-button-text">
        <span class="ui-icon
          ui-icon-triangle-1-n">?
        </span>
      </span>
    </a>
    <a class="ui-spinner-button ui-spinner-down
      ui-corner-br ui-button ui-widget
      ui-state-default ui-button-text-only"
      tabindex="-1" role="button">
      <span class="ui-button-text">
        <span class="ui-icon
          ui-icon-triangle-1-s">?
        </span>
      </span>
    </a>
  </span>
</span>
```

Examples for DecimalField

DecimalField has the following variations:

- **Default Functionality**. Lets you enter decimal values with a specified number of decimal places. If you enter a decimal value with more decimal places than allowed and click **Submit**, the number is rounded to the nearest specified decimal place. For example, 0.337 is rounded to 0.34 when 2 decimal places are specified.
- **Min-Max DecimalField**. Lets you enter only decimal values within a specified minimum and maximum range. If you enter a decimal value outside the range, the number automatically resets to the nearest limit.
- **Precision DecimalField**. Sets DecimalPlaces to a specific number. The default value is 2. For example, if you specify 6 and enter fewer than 6 places, zeroes are added; 0.123 is replaced with 0.123000 when you click **Submit**. If you enter more decimal values such as 0.12345678 and click **Submit**, the number is rounded to the nearest 6 decimal places (0.123457).

Default functionality example

.aspx

```
<asp:Label id="uxDecimalFieldLabel" AssociatedControlID="uxDecimalField"
runat="server">Ektron Decimal Field:</asp:Label>
<ektronUI:DecimalField ID="uxDecimalField" ErrorMessage="Please enter a valid decimal."
runat="server" ></ektronUI:DecimalField>
<ektronUI:ValidationMessage ID="uxValidationmessage"
```

```
AssociatedControlID="uxDecimalField" runat="server" />
<br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxDecimalField.Text;
        // at this point we could use the value with confidence...
    }
}
```

Min-Max DecimalField example

.aspx

```
<asp:Label id="uxDecimalFieldLabel" AssociatedControlID="uxDecimalField"
runat="server">Enter a value from 0 to 1.00:</asp:Label>
<ektronUI:DecimalField ID="uxDecimalField" ErrorMessage="Please enter a valid decimal."
MinValue="0" MaxValue="1.00" runat="server" ></ektronUI:DecimalField>
<ektronUI:ValidationMessage ID="uxValidationmessage" AssociatedControlID=""
runat="server" /><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxDecimalField.Text;
        // at this point we could use the value with confidence...
    }
}
```

Precision DecimalField example

.aspx

```
<asp:Label id="uxDecimalFieldLabel" AssociatedControlID="uxDecimalField"
runat="server">Ektron Decimal Field:</asp:Label>
<ektronUI:DecimalField ID="uxDecimalField" ErrorMessage="Please enter a valid decimal."
DecimalPlaces="6" runat="server" ></ektronUI:DecimalField>
<ektronUI:ValidationMessage ID="uxValidationmessage"
AssociatedControlID="uxDecimalField" runat="server" />
<br />
```

```
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxDecimalField.Text;
        // at this point we could use the value with confidence...
    }
}
```

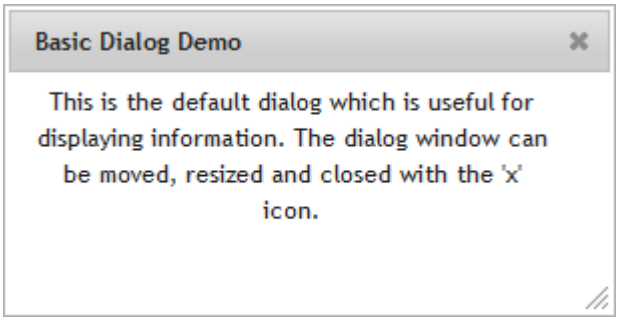
Dialog

8.50 and higher

```
<EktronUI:Dialog>
```

Creates a floating window that contains a title bar, content area, and dialog buttons. A dialog window can be moved, resized, and closed with the "x" icon. If the content length exceeds maximum height, a scroll bar automatically appears.

The following image shows an `<EktronUI:Dialog>` box that contains a `ContentBlock` server control. Additionally, this dialog box is set to *modal* with *vertical scrolling*, *resizable*, and *draggable* options turned on.



Events for Dialog

None.

Methods for Dialog

None.

Theming for Dialog

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div style="display: block; z-index: 1002;
  outline: 0px none; position: absolute;
  height: auto; width: 300px; top: 108px;
  left: 352px;" class="ui-dialog ui-widget
  ui-widget-content ui-corner-all ui-draggable
  ui-resizable" tabindex="-1" role="dialog"
```

```
aria-labelledby="ui-dialog-title-uxDialog_
  Dialog_uxDialogControl">
<div class="ui-dialog-titlebar ui-widget-header
  ui-corner-all ui-helper-clearfix">
  <span class="ui-dialog-title"
    id="ui-dialog-title-uxDialog_Dialog_
      uxDialogControl">PostBack Dialog Demo
  </span>
  <a href="#" class="ui-dialog-titlebar-close
    ui-corner-all" role="button">
    <span class="ui-icon ui-icon-closethick">
      close
     </span>
  </a>
</div>
<div class="ektron-ui-dialog ui-dialog-content
  ui-widget-content"
  id="uxDialog_Dialog_uxDialogControl"
  style="width: auto; min-height: 48.8px;
  height: auto;">
    Dialog Content Goes Here.
</div>
<div class="ui-resizable-handle ui-resizable-n">
</div>
<div class="ui-resizable-handle ui-resizable-e">
</div>
<div class="ui-resizable-handle ui-resizable-s">
</div>
<div class="ui-resizable-handle ui-resizable-w">
</div>
<div class="ui-resizable-handle
  ui-resizable-se ui-icon
  ui-icon-gripsmall-diagonal-se
  ui-icon-grip-diagonal-se"
  style="z-index: 1001;">
</div>
<div class="ui-resizable-handle
  ui-resizable-sw" style="z-index: 1002;">
</div>
<div class="ui-resizable-handle ui-resizable-ne"
  style="z-index: 1003;">
</div>
<div class="ui-resizable-handle ui-resizable-nw"
  style="z-index: 1004;">
</div>
<div class="ui-dialog-buttonpane ui-widget-content
  ui-helper-clearfix">
  <div class="ui-dialog-buttonset">
    <button type="button" class="ui-button
      ui-widget ui-state-default ui-corner-all
      ui-button-text-only" role="button" >
      <span class="ui-button-text">
        Dialog Button Text
      </span>
    </button>
  </div>
```

```
  </div>
</div>
```

Examples for Dialog

Dialog has the following variations:

- **Default Functionality**. Displays a floating window. The dialog window can be moved, resized and closed with the X icon.
- **Client Controlled**. Displays a floating window when you click a button.
- **Modal Dialog**. The dialog is a child window that requires users to interact with it before they can perform any action on the parent page. It adds an overlay that makes the dialog look more prominent because it dims out the page content.
- **Non-Draggable Dialog**. A basic dialog that you cannot drag; `Draggable="false"`.
- **Non-Resizable Dialog**. A basic dialog that you cannot resize; `Resizable="false"`.
- **Postback Dialog**. A dialog that has a postback event when you click a button.
- **Stackable Dialog**. Stackable dialogs move to the front of the other dialogs when it has focus. Click on the others or move dialogs around. Non-Stackable dialogs will not move to the front of stackable dialogs.

Default functionality example

.aspx

```
<ektronUI:Dialog ID="uxDialog" runat="server" Title="Basic Dialog Demo" AutoOpen="true"
>
    <ContentTemplate>
        This is the default dialog which is useful for displaying information. The
dialog window can be moved, resized and closed with the 'x' icon.
    </ContentTemplate>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

Client Controlled example

.aspx

```
<ektronUI:JavaScriptBlock ID="uxOpenDialogScript" runat="server"
ExecutionMode="OnParse">
    <ScriptTemplate>
        function openDialog(){
            $ektron("<%= uxDialog.Selector %>").dialog("open");
        }

        function closeDialog(){
            $ektron("<%= uxDialog.Selector %>").dialog("close");
        }
```

```
    </ScriptTemplate>
</ektronUI:JavaScriptBlock>
<p>Click the "Open Dialog" button to start the demo.</p>
<ektronUI:Button DisplayMode="Button" runat="server" ID="OpenDialogButton" Text="Open
Dialog" OnClientClick="openDialog(); return false;"></ektronUI:Button>
<br />
<ektronUI:Button DisplayMode="Button" runat="server" ID="CloseDialogButton" Text="Close
Dialog" OnClientClick="closeDialog();return false;"></ektronUI:Button>
<ektronUI:Dialog ID="uxDialog" runat="server" Title="Client Controlled Dialog Demo"
AutoOpen="false" >
    <ContentTemplate>
        A basic dialog that is opened and closed from client-side Javascript code,
called by each buttons client-side onclick handler.
    </ContentTemplate>
    <Buttons>
        <ektronUI:DialogButton ID="DialogButtonClose" runat="server" Text="Close Dialog"
CloseDialog="true"></ektronUI:DialogButton>
    </Buttons>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

Modal Dialog example

.aspx

```
<ektronUI:Dialog ID="uxDialog" runat="server" Title="Modal Dialog Demo" AutoOpen="true"
Modal="true" >
    <ContentTemplate>
        <p>In modal mode, the dialog is a child window that requires users to interact
with it before they can perform any action on the parent page.</p>
        <p>It adds an overlay that makes the dialog look more prominent because it dims
out the page content.</p>
    </ContentTemplate>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

Non-Draggable Dialog example

.aspx

```
<ektronUI:Dialog ID="uxDialog" runat="server" Title="Non-Draggable Dialog"
AutoOpen="true" Draggable="false" >
    <ContentTemplate>
        A basic dialog that is not draggable; Draggable="false".
    </ContentTemplate>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

Non-Resizable Dialog example

.aspx

```
<ektronUI:Dialog ID="uxDialog" runat="server" Title="Non-Resizable Dialog"
AutoOpen="true" Resizable="false" >
    <ContentTemplate>
        A basic dialog that is not resizable; Resizable="false".
    </ContentTemplate>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

Postback example

.aspx

```
<ektronUI:Dialog ID="uxDialog" runat="server" Title="PostBack Dialog Demo"
AutoOpen="<%#AutoOpen%>" >
    <ContentTemplate>
        Demonstrates using a server-side event handler for the DialogButton's click
event.
    </ContentTemplate>
    <Buttons>
        <ektronUI:DialogButton ID="PostBackDialogButton" runat="server" Text="Post Back"
OnClick="PostBackDialogButton_click" CloseDialog="true" />
    </Buttons>
</ektronUI:Dialog>
<asp:Literal ID="literal1" runat="server" />
```

.aspx.cs

```
protected void PostBackDialogButton_click(object sender, EventArgs e)
{
    literal1.Text = "The Dialogs Post-Back button was clicked!";
    AutoOpen = false;
}

protected override void OnPreRender(EventArgs e)
{
    DataBind();
    base.OnPreRender(e);
}
```

Stackable Dialog example

.aspx

```
<ektronUI:Dialog ID="Dialog1" runat="server" Title="Stackable Dialog One"
AutoOpen="true" Stack="true" Width="500" Height="150" >
    <ContentTemplate>
        Stackable Dialog One - Stackable dialogs move to the front of the other dialogs
when it has focus. Click on the others or move dialogs around to demonstrate this.
    </ContentTemplate>
```

```
</ektronUI:Dialog>
<ektronUI:Dialog ID="Dialog2" runat="server" Title="Stackable Dialog Two"
AutoOpen="true" Width="300" Height="200" >
    <ContentTemplate>
        Stackable Dialog Two (stackable by default) - Stackable dialogs move to the
front of the other dialogs when it has focus. Click on the others or move dialogs around
to demonstrate this.
    </ContentTemplate>
</ektronUI:Dialog>
<ektronUI:Dialog ID="Dialog" runat="server" Title="Non-Stackable Dialog" AutoOpen="true"
Stack="false" Width="700" Height="250" >
    <ContentTemplate>
        Non-Stackable Dialog - Non-Stackable dialogs will not move to the front of
stackable dialogs.
    </ContentTemplate>
</ektronUI:Dialog>
```

NOTE: .aspx.cs not required.

InfoTip

9.00 and higher

```
<EktronUI:InfoTip>
```

InfoTip initially hides a message and makes it visible "on demand." Displaying the message is triggered by hovering over the "I" image anchor. When the mouse is moved away from the icon, the message disappears.

InfoTip should describe only the UI element next to which it is placed.

Use InfoTip if help text is too long for display below an input field or if the information provided is relevant to, but not directly required for the user to successfully complete the form field.

Events for InfoTip

None.

Methods for InfoTip

None.

Theming for InfoTip

Infotip is a specific use of the jQuery UI Tooltip, and so it follows their CSS Framework and the ThemeRoller tool to create and download custom themes that are easy to build and maintain.

Example for InfoTip

Default functionality example

.aspx

```
<ektronUI:Infotip ID="uxDemo" runat="server">
    This is cryptic, because it serves no independent function.  It is present
    merely as a demonstration of the Infotip server control.  Marking it as checked
    or unchecked will have no effect on the page.
</ektronUI:Infotip>
```

NOTE: .aspx.cs not required.

Positioning example

.aspx

```
<ektronUI:Infotip ID="Infotip1" PositionMy="right bottom" PositionAt="left top"
runat="server">
```

```
    The <strong>right bottom</strong> corner of this message is positioned at the
    <strong>left top</strong> corner of the image anchor.
</ektronUI:Infotip>
```

NOTE: .aspx.cs not required.

IntegerField

8.50 and higher

```
<EktronUI:IntegerField>
```

Creates an input field that allows only integers.

If you type a decimal value and press **Enter**, the number is rounded to the nearest integer. For example, if you type 12.888 and click **Submit**, the value changes to 13.

User-supplied input is validated using the field's built-in *IntegerRule* validator. Input is optional, but you can make it mandatory by adding a *RequiredRule* to the control's *ValidationRules*. The strongly typed (integer) value property is the primary means to query or update the field.

Events for IntegerField

None.

Methods for IntegerField

None.

Theming for IntegerField

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<span class="ektron-ui-control ektron-ui-input
  ektron-ui-integerField"
  id="uxIntegerField_IntegerField_uxTextField">
  <span class="ui-spinner ui-state-default
    ui-widget ui-widget-content ui-corner-all">
    <input type="text"
      id="uxIntegerField_IntegerField_aspInput"
      value="0"
      name="uxIntegerField$IntegerField$aspInput"
      class="ui-spinner-input   ektron-ui-valid"
      autocomplete="off" role="spinbutton"
      aria-valuemin="-2147483648"
      aria-valuemax="2147483647"
```

```
      aria-valuenow="0"
      data-ektron-initialvalue="0"
      data-ektron-validationgroup="" />
    <a class="ui-spinner-button ui-spinner-up
      ui-corner-tr ui-button ui-widget
      ui-state-default ui-button-text-only"
      tabindex="-1" role="button">
      <span class="ui-button-text">
        <span class="ui-icon ui-icon-triangle-1-n">?
        </span>
      </span>
    </a>
    <a class="ui-spinner-button ui-spinner-down
       ui-corner-br ui-button ui-widget
      ui-state-default ui-button-text-only"
      tabindex="-1" role="button">
      <span class="ui-button-text">
        <span class="ui-icon
          ui-icon-triangle-1-s">?
        </span>
      </span>
    </a>
  </span>
</span>
```

Examples for IntegerField

IntegerField has the following variations:

- **Default Functionality**. IntegerField lets you enter only integer values. If you enter a decimal value and click **Submit**, the number is rounded to the nearest integer.
- **Min-Max DecimalField**. Lets you enter only integer values within a specified minimum and maximum range. If you enter a decimal value and click **Submit**, the number is rounded to the nearest integer. If you enter a number outside the range, the number automatically resets to the nearest limit.

Default functionality example

.aspx

```
<asp:Label id="uxIntegerFieldLabel" AssociatedControlID="uxIntegerField"
runat="server">Ektron Integer Field:</asp:Label>
<ektronUI:IntegerField ID="uxIntegerField" ErrorMessage="Please enter a valid integer."
runat="server" ></ektronUI:IntegerField>
<ektronUI:ValidationMessage ID="uxValidationmessage"
AssociatedControlID="uxIntegerField" runat="server" />
<br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxIntegerField.Text;
        // at this point we could use the value with confidence...
    }
}
```

Min-Max IntegerField example

.aspx

```
<asp:Label id="uxIntegerFieldLabel" AssociatedControlID="uxIntegerField"
runat="server">Enter a value from 1 to 10:</asp:Label>
<ektronUI:IntegerField ID="uxIntegerField" MinValue="1" MaxValue="10" Text="5"
ErrorMessage="Please enter a valid integer." runat="server" ></ektronUI:IntegerField>
<ektronUI:ValidationMessage ID="uxValidationmessage"
AssociatedControlID="uxIntegerField" runat="server" />
<br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the user supplied value
    if (Page.IsValid)
    {
        string value = uxIntegerField.Text;
        // at this point we could use the value with confidence...
    }
}
```

JavaScript

8.50 and higher

```
<EktronUI:JavaScript>
```

Associates an external file containing JavaScript (JS) code to an ASP.NET control. The `<EktronUI:JavaScript>` control offers several advantages over loading JavaScript statically on template pages and programmatically in code

- **JS files are sent to the browser once**. During a request, `<EktronUI:JavaScript>` manages whether a JS file was already referenced. Subsequent references to the same JS file are ignored. During an AJAX-Postback inside an ASP UpdatePanel, `<EktronUI:JavaScript>` manages which JS files are already loaded by the browser. References to a JS file during and AJAX-Postback are processed only if the JS is not already loaded in the browser.
- **JS files are aggregated**. To increase performance, JS files referenced by `<EktronUI:JavaScript>` controls are aggregated into a single file. Any URL references (including background-images), are automatically resolved into fully qualified paths. You may choose to "opt-out" of aggregation by setting the `Aggregate` property on the control to `false`. You can switch off JS aggregation for `<EktronUI:JavaScript>` references by setting the `AllowJavaScriptAggregation` key to `false` in `Ektron.Cms.Framework.UI.Config`.
- **JS files are minified**. To increase performance, JS files reference by `<EktronUI:JavaScript>` controls are minified. You can switch off JS minification for `<EktronUI:JavaScript>` references by setting the `AllowJavaScriptMinification` key to `false` in `Ektron.Cms.Framework.UI.Config`.

<ektronUI:JavaScript ID="uxJavaScript" runat="server" Path="
{SitePath}/developer/Framework/UI/Controls/EktronUI/JavaScript/remoteJavaScriptSample.j
s" />
<ektronUI:CssBlock ID="uxCssBlock" runat="server">
    <CssTemplate>
        .targetForDemoContent {padding: .5em; margin: .5em 0; border: solid #ccc 1px;
background: #eee; color: #666666;}
    </CssTemplate>
</ektronUI:CssBlock>
```

NOTE: .aspx.cs not required.

JavaScriptBlock

8.50 and higher

```
Tag: <EktronUI:JavaScriptBlock>
```

Lets you define and apply inline JavaScript (JS) rules inside any ASP.NET control without authoring invalid HTML markup. The JavaScriptBlock control renders its contents inside a `<script>` tag and can have the code within the block execute either as it is parsed by the browser, or after the rendered page is ready.

DataBinder evaluations may be used to generate dynamic JavaScript code.

Events for JavaScriptBlock

        .targetForDemoContent {padding: .5em; margin: .5em 0; border: solid #ccc 1px;
background: #eee; color: #666666;}
    </CssTemplate>
</ektronUI:CssBlock>
<ektronUI:JavaScriptBlock ID="uxJavaScriptBlock" runat="server">
    <ScriptTemplate>
        var targetForDemoContent = $ektron(".targetForDemoContent");
        $ektron(".demoAddButton").bind("click", function () {
            targetForDemoContent.html("Thanks for clicking that button and adding this
sentence to the page.");
            return false;
        });
```

```
        $ektron(".demoResetButton").bind("click", function () {
            targetForDemoContent.html(" ");
            return false;
        });
    </ScriptTemplate>
</ektronUI:JavaScriptBlock>
```

NOTE: .aspx.cs not required.

Label

8.50 and higher

```
Tag: <EktronUI:Label>
```

Outputs an HTML <label> tag that is different than the tag in a standard ASP label control. <EktronUI:label> sets the "for" attribute of the <label> tag property (differently from the standard ASP .NET <label> control).

The following image shows "First Name" label next to a text field.

Use this control where you need to associate this label with another EktronUI server control instead of an asp:label because an asp:label will not set the for attribute correctly when the AssociatedControlID is set on an EktronUI control. The markup is always an HTML <label> tag. An asp:Label outputs either a or a <label> tag depending on whether the AssociatedControlID property is set or not.

Validation Rules you can apply to this control are:

- CustomRule
- RegexRule
- RequiredRule

Properties

- CssClass. Gets or sets the Cascading Style Sheet (CSS) class rendered by the control on the client.
- Enabled. Gets or sets a value indicating whether the control is enabled.
- ID. Gets or sets the programmatic identifier assigned to the server control.
- TabIndex. Gets or sets the tab index of the control.
- TextToolTip. Gets or sets the text displayed when the mouse pointer hovers over the control.
- ViewStateMode. Gets or sets the view-state mode of this control.
- Visible. Gets or sets a value that indicates whether a control is rendered as UI on the page.

Default functionality example

.aspx

```
<ektronUI:Label runat="server" ID="uxLabel" AssociatedControlID="uxTextField">Ektron UI
Label:</ektronUI:Label>
<ektronUI:TextField runat="server" ID="uxTextField"></ektronUI:TextField>
```

NOTE: .aspx.cs not required.

Message

8.50 and higher

```
<EktronUI:Message>
```

Displays messages to users of an application in a consistent and themable format. The control supports 5 built-in display modes for messages: Error, Help, Information, Success and Warning. By default the control displays a message as type Error. The control provides easily accessible properties to let you quickly change both the content and display type for a message, allowing a single instance of the control to serve multiple UI purposes.

Events for Message

None.

Methods for Message

None.

Theming for Message

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div class="ektron-ui-control ui-corner-all ektron-ui-message ektron-ui-error ektron-ui-
clearfix"
  id="uxErrorMessage_Message_uxMessage">

Examples for Message

Message has the following variations:

- **Default Functionality**. See above.
- **Dynamic Message**. You can dynamically alter the message displayed to the user by using the message control's Text and DisplayMode properties.

Default functionality example

.aspx

```
<ektronUI:Message ID="uxErrorMessage" DisplayMode="Error" runat="server">
    <ContentTemplate>An example of an <code>Error</code> message.</ContentTemplate>
</ektronUI:Message>

<ektronUI:Message ID="uxHelpMessage" DisplayMode="Help" runat="server">
    <ContentTemplate>An example of a <code>Help</code> message.</ContentTemplate>
</ektronUI:Message>

<ektronUI:Message ID="uxInformationMessage" DisplayMode="Information" runat="server">
    <ContentTemplate>An example of an <code>Information</code>
message.</ContentTemplate>
</ektronUI:Message>

<ektronUI:Message ID="uxSuccessMessage" DisplayMode="Success" runat="server">
    <ContentTemplate>An example of a <code>Success</code> message.</ContentTemplate>
</ektronUI:Message>

<ektronUI:Message ID="uxWarningMessage" DisplayMode="Warning" runat="server">
    <ContentTemplate>An example of a <code>Warning</code> message.<br />
```

```
    <br />
    Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent nec erat risus.
Suspendisse in varius tortor. Nunc at tellus diam, a sodales neque. Phasellus
condimentum hendrerit porta. Donec pretium leo et leo congue sodales. Etiam pretium
suscipit orci, a commodo diam tempus eget. Donec ac lacus ut augue imperdiet convallis
quis at diam. Nunc eget nunc neque, eget adipiscing velit. Donec venenatis egestas
sagittis. Duis mattis, eros at gravida venenatis, quam justo posuere urna, pharetra
semper tortor eros quis felis. Donec vitae porta ligula. Vivamus et vestibulum elit.
Nulla rhoncus ipsum vel nibh tristique tempus. In velit tellus, faucibus et commodo ut,
vulputate nec tellus. Mauris non est quis nisl fermentum egestas. Donec vestibulum
consequat odio et rhoncus.</ContentTemplate>
</ektronUI:Message>
```

NOTE: .aspx.cs not required.

Dynamic Message example

.aspx

```
<ektronUI:Message DisplayMode="Information" ID="uxMessage" runat="server">
    <ContentTemplate>
    To change the text and display mode shown in this message, select a different
display mode option from the drop down menu provided.
    </ContentTemplate>
</ektronUI:Message>
<ektronUI:Label ID="uxDisplayModeLabel" runat="server"
AssociatedControlID="aspDisplayMode" Text="Display Mode: " />
<asp:DropDownList id="aspDisplayMode" name="culture"  AutoPostBack="true"
OnSelectedIndexChanged="aspDisplayModeChange_change" runat="server"></asp:DropDownList>
```

.aspx.cs

```
using System;
using System.Collections;
using System.Collections.Generic;
using System.Globalization;
using System.Web.UI.WebControls;

}
```

Pager

8.50 and higher

```
<EktronUI:Pager>
```

Limits the number of items on a page and provide simple navigation to other items. Use this with any controller that supports `IPageable`.

NOTE: You can improve performance by setting the `ResultsPerPage` property so this request is on the server side as the data is aggregated.

The default template used by the `<EktronUI:Pager>` server control is located at:

```
[site root]/Workarea/FrameworkUI/Templates/EktronUI/Pager.ascx
```

Attributes for Pager

Events for Pager

None.

Methods for Pager

None.

Theming for Pager

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxPager" class="ektron-ui-control ektron-ui-pager">
  <span class="previous alignLeft">
    <span class="ektron-ui-button">
      <a href="#Previous"
        onclick="if ($ektron(this).is('.ui-state-disabled,
        .ui-state-disabled &gt; span')){ return false;};
        WebForm_DoPostBackWithOptions(new WebForm_PostBackOptions
        ('pager1$ctl00$Pager$uxPrevious', '', true, '', '', false, true));"
        title="" name="pager1_Pager_0_uxPrevious_0_Button"
```

```
        id="pager1_Pager_0_uxPrevious_0_Button"
        class="ui-button ui-widget ui-state-default ui-corner-all
          ui-button-disabled ui-state-disabled ui-button-text-icon-primary"
        role="button" aria-disabled="true" disabled="disabled">
        <span class="ui-button-icon-primary ui-icon ui-icon-seek-prev"
          onclick="if ($ektron(this).is('.ui-state-disabled,
          .ui-state-disabled &gt; span')){ return false;};
          WebForm_DoPostBackWithOptions(new WebForm_PostBackOptions
          ('pager1$ctl00$Pager$uxPrevious', '', true, '', '', false,
            true)); return false;">
        </span>
        <span class="ui-button-text" onclick="if ($ektron(this).is
          ('.ui-state-disabled, .ui-state-disabled &gt; span'))
            { return false;};
          WebForm_DoPostBackWithOptions(new WebForm_PostBackOptions
          ('pager1$ctl00$Pager$uxPrevious', '', true, '', '', false,
            true)); return false;">Previous
        </span>
      </a>
    </span>
    <script type="text/javascript"

    name="pager1$ctl00$Pager$aspCurrentPage">
</div>
```

Example for Pager

Default functionality example

.aspx

```
<ektron:SiteSearchInputView ControllerID="SearchController1" ID="SiteSearch1"
runat="server"></ektron:SiteSearchInputView>
<ektron:SiteSearchController ID="SearchController1" runat="server" />
<ektron:SiteSearchResultsView ControllerID="SearchController1" ID="SearchResults1"
runat="server"></ektron:SiteSearchResultsView>
<ektronUI:Pager ID="pager1" runat="server" PageableControlID="SearchController1"
ResultsPerPage="5"></ektronUI:Pager>
```

NOTE: .aspx.cs not required.

Tabs

8.50 and higher

```
<EktronUI:Tabs>
```

Provides horizontally tabbed headers to display multiple sections of content. (See also *Accordion* on page 1908.)

When you click a tab, it is highlighted and the content for that section appears.

Events for Tabs

- `Click`. Set to server side event handler that is called when a user clicks the tab. Must be set on the contained Tab control.
- `Command`. The Command event is raised when the control is clicked. By associating a command name with the control, one method can handle the event from multiple controls, and you can programmatically determine the specific control that triggered the event by examining the event's command name.

Methods for Tabs

- `SetActiveTab(EktronUI.Tab)`. Selects the supplied tab; must be a child of the `<EktronUI:Tabs>` control.
- `SetActiveTab(string)`. Selects the child tab that has the supplied name.

Theming for Tabs

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div class="ektron-ui-control ektron-ui-accordion
  devsite-demo-tabs ui-tabs ui-widget
```

```
  ui-widget-content ui-corner-all"
  id="uxDemoTabs">
  <ul class="ui-tabs-nav ui-helper-reset
    ui-helper-clearfix ui-widget-header
    ui-corner-all">
    <li class="ui-state-default ui-corner-top
      ui-tabs-selected ui-state-active">
      <a title="Tab One" href="#uxDemoTabs_uxTab1">
        Tab One
      </a>
    </li>
    <li class="ui-state-default ui-corner-top">
      <a title="Tab Two" href="#uxDemoTabs_uxTab2">
        Tab Two
      </a>
    </li>
    <li class="ui-state-default ui-corner-top">
      <a title="Tab Three"
        href="#uxDemoTabs_uxTab3">
        Tab Three
      </a>
    </li>
  </ul>
  <div class="ektron-ui-control ektron-ui-tab
    EktronUI ui-tabs-panel ui-widget-content
    ui-corner-bottom" id="uxDemoTabs_uxTab1">
    <h4>Inside tab one</h4>
      Lorem ipsum dolor sit amet, consectetur
      adipisicing elit, sed do eiusmod tempor
      incididunt ut labore et dolore magna aliqua.
  </div>
  <div class="ektron-ui-control ektron-ui-tab
    EktronUI ui-tabs-panel ui-widget-content
    ui-corner-bottom ui-tabs-hide"
    id="uxDemoTabs_uxTab2">
    <h4>Inside tab two</h4>

      in reprehenderit in voluptate velit esse
      cillum dolore eu fugiat nulla pariatur.
  </div>
  <div class="ektron-ui-control ektron-ui-tab
    EktronUI ui-tabs-panel ui-widget-content
    ui-corner-bottom ui-tabs-hide"
    id="uxDemoTabs_uxTab3">
    <h4>Inside tab three</h4>
      Excepteur sint occaecat cupidatat non
      proident, sunt in culpa qui officia deserunt
      mollit anim id est laborum.
  </div>
  <input type="hidden" value="0"
    id="uxDemoTabs_TabsSelectedIndex"
    name="uxDemoTabs$TabsSelectedIndex" />
</div>
```

Examples for Tabs

Tabs has the following variations:

- **Default Functionality**. Horizontal tab controls display grouped content.
- **Active Tab**. Shows the active tab that is set in the code-behind in the page's OnLoad method.
- **Contains Controls**. Clicking on a tab fills a field with postback text. AutoHeight is disabled, which causes each tab to fit their contents rather than adjusting all tabs to the size of the largest.
- **Databind to Add Tabs**. Adds a tab by Databinding.
- **Dynamically Add Tabs**. Adds a tab programatically.
- **Postback**. Displays text that is associated with the click event. The Tabs control contains a server-side onclick event handler that generates a postback when clicked.

Default functionality example

.aspx

```
<ektronUI:Tabs ID="uxDemoTabs" runat="server" CssClass="devsite-demo-tabs" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <h4>Inside tab one</h4>
            Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod
tempor incididunt ut labore et dolore magna aliqua.
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <h4>Inside tab two</h4>
            Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut
aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate
velit esse cillum dolore eu fugiat nulla pariatur.
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab3" runat="server" CssClass="EktronUI" Text="Tab Three" >
        <ContentTemplate>
            <h4>Inside tab three</h4>
            Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia
deserunt mollit anim id est laborum.
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Tabs>
```

NOTE: .aspx.cs not required.

Active Tab example

.aspx

```
<ektronUI:Tabs ID="uxDemoTabs" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <h2>Inside tab one</h2>
            <p>Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod
tempor incididunt ut labore et dolore magna aliqua.</p>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <h2>Inside tab two</h2>
            <p>Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi
ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate
velit esse cillum dolore eu fugiat nulla pariatur.</p>
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab3" runat="server" CssClass="EktronUI" Text="Tab Three" >
        <ContentTemplate>
            <h2>Inside tab three</h2>
            <p>Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia
deserunt mollit anim id est laborum.</p>
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Tabs>
```

.aspx.cs

```
protected override void OnLoad(EventArgs e)
{
    base.OnLoad(e);
    uxDemoTabs.SetActiveTab(uxTab2);
}
```

Contains Controls example

.aspx

```
<ektronUI:Tabs ID="uxDemoTabs" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            <ektronUI:TextField ID="uxTextField" runat="server" Text="" />
            <ektronUI:ButtonSet ID="ButtonSet1" runat="server">
                    <ektronUI:Button ID="Button1" runat="server"  DisplayMode="Checkbox"
OnClick="Button1_click" />
                    <ektronUI:Button ID="Button2" runat="server"  DisplayMode="Checkbox"
OnClick="Button2_click" />
                    <ektronUI:Button ID="Button3" runat="server"  DisplayMode="Checkbox"
OnClick="Button3_click" />
                </ektronUI:ButtonSet>
        </ContentTemplate>
    </ektronUI:Tab>
```

```
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two" >
        <ContentTemplate>
            <cms:Login ID="login1" runat="server" /><br /><br />
            <cms:ContentBlock ID="cb1" runat="server" DefaultContentID="30" />
            <cms:ListSummary ID="ls1" runat="server" FolderID="78" Recursive="false" />
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Tabs>
```

.aspx.cs

```
protected override void OnLoad(EventArgs e)
{
    base.OnLoad(e);
}

            button.OnClientClick = "alert('button clicked!')";
            button.Click += OnButtonClicked;
            tab.Controls.Add(button);
        }

        protected void OnButtonClicked(object source, EventArgs args) {
            uxTabsControl.SetActiveTab("DynamicTab1");
            messageLiteral.Text = "Button Clicked!";
        }
```

Postback example

.aspx

```
<ektronUI:Tabs ID="uxDemoTabs" runat="server" >
    <ektronUI:Tab ID="uxTab1" runat="server" CssClass="EktronUI" Text="Tab One" >
        <ContentTemplate>
            Static content... (click the other tab)
        </ContentTemplate>
    </ektronUI:Tab>
    <ektronUI:Tab ID="uxTab2" runat="server" CssClass="EktronUI" Text="Tab Two"
OnClick="uxTab2_click" >
        <ContentTemplate>
            <b>
                <asp:Literal ID="literal1" runat="server" />
            </b>
        </ContentTemplate>
    </ektronUI:Tab>
</ektronUI:Tabs>
```

.aspx.cs

```
protected void uxTab2_click(object sender, EventArgs e)
{
    uxTab2.Text = "Tab Two (been clicked)";
    uxDemoTabs.SetActiveTab(uxTab2);
    literal1.Text = "Content set in code-behind, during click event servicing...)";
}
```

TextField

8.50 and higher

```
<EktronUI:TextField>
```

Creates and input field in which you can enter text.

The `<EktronUI:TextField>` control is a non-data-typed I/O control. Input is optional, but you can make it mandatory by adding a *RequiredRule* to the control's *ValidationRules*. The *Text* property is the primary means to query or update the field.

Events for TextField

None.

Methods for TextField

None.

Theming for TextField

Styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<span class="ektron-ui-control ektron-ui-input
  ektron-ui-textField"
  id="uxTextField_TextField_uxTextField">
  <input type="text"
    id="uxTextField_TextField_aspInput"
    value="Sample Text"
    name="uxTextField$TextField$aspInput">
</span>
```

Examples for TextField

TextField has the following variations:

- **Default Functionality**. "Sample Text" is placed in the field that you can replace with any text. Click **Submit** to read back the text on postback.

- **Custom Validation**. CustomRuleValidator is added to the TextField input control to verify that the user input contains a specified word. If you remove the specified word from the text field and click **Submit**, a message appears saying that the user must have the specified word in the text field. You can re-use the custom validation method for more than one rule, or have a unique method for each.

  The custom rule validator has a parameter of type `CustomRuleValidatorEventArgs`. This type is defined in `Ektron.Cms.Framework.UI.Controls.EktronUI.Core.Validation`.
- **Disabled TextField**. "Sample text" is placed in the field and can be seen but not modified. Validation is not needed for a disabled (or invisible) control.
- **Regex Validation**. Validates specific data, such as a street address (`123 Demo Road`) using `ServerRegex="\d+\s+\w+"`. Replace `123 Demo Road` with `Sample Text` and click **Submit** to see a message that shows that the new input does not meet the requirements of the RegEx rule. Enter `1600 Pennsylvania Avenue` and click **Submit** to cause `Page.IsValid` to return `True`. The example specifies a server-side validation RegEx only; client-side regular expression validators are specified using ClientRegex. Because a server-side RegEx is specified, the form submits and any related validation failures are captured on the server side.
- **Validation**. Adds RequiredRule to the TextField input control so that the field changes color if blank is entered, indicating that the user must enter text in the field. The client-side validator prevents a postback from taking place, and displays the supplied ErrorMessage text to the user.
- **Validation No-Client**. Adds RequiredRule to the TextField input control and disables client side validation by declaratively setting `ClientValidationEnabled="false"` on the rule. Because client-side validation is disabled, the form sends a postback to the server (even with invalid data). Valid input values are tested using `Page.IsValid` in the button-click event handler and, for example, only store user values to the database if `Page.IsValid` returns `True`. Server-side validation is performed automatically by ASP.NET, but you also can validate it programmatically by calling `Page.Validate()`.
- **Validation Groups**. Organizes content into sections, and validates only the relevant section. For example, you may have a user login section display on the same form as a user registration section. You can assign ValidationGroup properties to the login related controls, and a different one for the registration controls. Clicking the submit buttons with any text causes `Page.IsValid` to return `True`.

Default functionality example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="Sample Text">
```

```
</ektronUI:TextField><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // get the textfield value
    string value = uxTextField.Text;
}
```

Custom Validation example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="Custom validator demo" >
    <ValidationRules>
        <ektronUI:CustomRule ServerValidationEnabled="true"
OnValidating="MyCustomRuleValidator" />
    </ValidationRules>
</ektronUI:TextField><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button><br />
<asp:Literal ID="InfoMessage" runat="server" />
```

.aspx.cs

```
protected void MyCustomRuleValidator(Object sender, CustomRuleValidatorEventArgs e)
{
    if (e.Enabled)
    {
        string userText = string.Empty;

        var textBoxControl = e.ControlToValidate as System.Web.UI.WebControls.TextBox;
        if (textBoxControl != null)
        {
            userText = textBoxControl.Text;
        }

        e.IsValid = userText.ToLower().Contains("custom");
        e.ErrorMessage = "Input must contain the word 'custom'";
    }
    else
    {
        e.IsValid = true;
    }
}

protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the textfield value
    if (Page.IsValid)
```

```
    {
        string value = uxTextField.Text;
    }

    ShowInfo();
}

protected void ShowInfo()
{
    if (Page.IsValid)
    {
        InfoMessage.Text = "Page.IsValid: True";
        return;
    }

    // get the error message of the first failing validator
    foreach (IValidator validator in Page.Validators)
    {
        if (!validator.IsValid)
        {
            InfoMessage.Text = "Page.IsValid: False - " + validator.ErrorMessage;
            break;
        }
    }
}
```

Disabled TextField example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Enabled="false" />
```

.aspx.cs

```
protected void Page_Init(object sender, EventArgs e)
{
    // set the textfield value
    uxTextField.Text = "Sample Text";
}
```

Regex Validation example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="123 Demo Road" >
    <ValidationRules>
        <ektronUI:RegexRule ServerRegex="\d+\s+\w+" ErrorMessage="Input does not satisfy
the Regex-Rule!" />
    </ValidationRules>
</ektronUI:TextField><br />
```

```
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button><br />
<asp:Literal ID="InfoMessage" runat="server" />
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the textfield value
    if (Page.IsValid)
    {
        string value = uxTextField.Text;
    }

    ShowInfo();
}

protected void ShowInfo()
{
    if (Page.IsValid)
    {
        InfoMessage.Text = "Page.IsValid: True";
        return;
    }

    // get the error message of the first failing validator
    foreach (IValidator validator in Page.Validators)
    {
        if (!validator.IsValid)
        {
            InfoMessage.Text = "Page.IsValid: False - " + validator.ErrorMessage;
            break;
        }
    }
}
```

Validation example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="Sample Text">
    <ValidationRules>
        <ektronUI:RequiredRule ErrorMessage="Text is required!" />
    </ValidationRules>
</ektronUI:TextField>
<ektronUI:ValidationMessage ID="uxValidationMessage" runat="server"
AssociatedControlID="uxTextField" /><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button>
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if input is valid, then get the textfield value
    if (Page.IsValid)
    {
        string value = uxTextField.Text;
        // at this point we could process the user input, store it to a database, etc...
    }
}
```

Validation No-Client example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="Sample Text">
    <ValidationRules>
        <ektronUI:RequiredRule ErrorMessage="Value is required!"
ClientValidationEnabled="false" />
    </ValidationRules>
</ektronUI:TextField><br />
<ektronUI:Button ID="uxSubmitButton" OnClick="uxSubmitButton_click" runat="server"
Text="Submit"></ektronUI:Button><br />
<asp:Literal ID="InfoMessage" runat="server" />
```

.aspx.cs

```
protected void uxSubmitButton_click(object sender, EventArgs e)
{
    // if valid, then get the textfield value
    if (Page.IsValid)
    {
        string value = uxTextField.Text;
    }

    ShowInfo();
}

protected void ShowInfo()
{
    if (Page.IsValid)
    {
        InfoMessage.Text = "Page.IsValid: True";
        return;
    }

    // get the error message of the first failing validator
    foreach (IValidator validator in Page.Validators)
    {
        if (!validator.IsValid)
        {
            InfoMessage.Text = "Page.IsValid: False - " + validator.ErrorMessage;
```

```
            break;
        }
    }
}
```

Validation Groups example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextFieldOne"
runat="server">Ektron Text Field:</ektronUI:Label>
    <ektronUI:TextField ID="uxTextFieldOne" ValidationGroup="Group1" runat="server"
Text="Sample Text">
        <ValidationRules>
            <ektronUI:RequiredRule ErrorMessage="Text is required!" />
        </ValidationRules>
    </ektronUI:TextField>
    <ektronUI:Button ID="uxSubmitButtonOne" OnClick="uxSubmitButtonOne_click"
ValidationGroup="Group1" runat="server" Text="Submit Group 1"></ektronUI:Button>
    <ektronUI:ValidationMessage ID="uxValidationMessage" runat="server"
AssociatedControlID="uxTextFieldOne" /><br />

{
    // get the validated textfield value for group one
    if (Page.IsValid)
    {
        string value = uxTextFieldOne.Text;
    }

    ShowInfo();
}

protected void uxSubmitButtonTwo_click(object sender, EventArgs e)
{
    // get the validated textfield value for group two
    if (Page.IsValid)
    {
        string value = uxTextFieldTwo.Text;
    }
```

```
    ShowInfo();
}

protected void ShowInfo()
{
    if (Page.IsValid)
    {
        InfoMessage.Text = "Page.IsValid: True";
        return;
    }

    // get the error message of the first failing validator
    foreach (IValidator validator in Page.Validators)
    {
        if (!validator.IsValid)
        {
            InfoMessage.Text = "Page.IsValid: False - " + validator.ErrorMessage;
            break;
        }
    }
}
```

Tree

9.00 and higher

```
<EktronUI:Tree>
```

A generic tree control renders items that are added declaratively or programatically as a nested unordered-list.

The markup is generated (on the client-side by default) using a template that provides CSS hooks for styling. The template can be customized to generate different markup if needed.

Part of a family of controls; ranging from the generic "Tree" and "ContextMenuTree" controls (which require their data to be supplied either declaratively or programatically), to controls that are intended to work with a particular Framework UI and it's data (pulling the data automatically); FolderTree, MenuTree and TaxonomyTree.

All of these controls were designed to be relatively simple to use, yet they provide many ways to customize their behavior as well as the resulting look and feel - maximizing flexibility for the end developer.

Events for Tree

- `Callback`. Fires when an Ajax callback is made from the tree controls client-side code (JavaScript). Values may be inspected, modified, or the default processing can be aborted - resulting in the current/custom values being serialized back to the client.

  Parameter Type: `TreeAjaxCallbackEventArgs`.

- `Click`. Event fires when a tree node is clicked.

  Parameter Type: `EventArgs`.

- `Command`. Command event will fire when a node with a CommandName is clicked. If CommandArgument is specified on the node, it will also be passed to the handler.

  Parameter Type: `CommandEventArgs`.

- `DataBinding`. Fires when the control is data binding.
- `ItemDataBound`. Fires for each node when the control is databinding.

  Parameter Type: `TreeItemDataBoundEventArgs<T>`.

- `PreSerializeData`. Event fires just before serializing the data for sending to the client. This is the last opportunity to inspect or modify the data before it is made available for rendering the UI.

  Parameter Type: `EventArgs`.

- `SelectionEvent`. Fired for all postbacks, passes the IDs of the currently

selected nodes.

Parameter Type: `TreeSelectionEventArgs`.

Methods for Tree

- `AddProcessor(ITreeDataProcessor)`. Provides an extension point, to add a custom ITreeDataProcessor adapter (`Ektron.Cms.Framework.UI.Controls.EktronUI.Widgets.ITreeDataProcessor`) to be inserted into the tree-data processing chain.
- `DataBind()`. Binds the control to the current data source (specified using the DataSource property).
- `GetNode(string)`. Returns the ID-specified node, if found.

  Return Type: `Ektron.Cms.Framework.UI.Tree.ITreeNode`.
- `GetNodeFromPath(string)`. Returns the path-specified node, if found.

  Return Type: `Ektron.Cms.Framework.UI.Tree.ITreeNode`.
- `GetParentNode(string)`. Returns the parent of the ID-specified node, if found.

  Return Type: `Ektron.Cms.Framework.UI.Tree.ITreeNode`.

Theming for Tree

Styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

    </li>
  </ul>
</div>
```

Generic Tree examples

- **Tree**. Adds tree nodes declaratively and in code-behind.
- **Tree Bubble-Command**. Node-events bubble up to the tree controls parent-container, and handled in code-behind:
- **Tree Command-Click**. Wires up each node to cause server-side code to execute, using either a general click-driven-postback and using command names and arguments.
- **TreeCurrentNode**. Handles the tree-controls click event on the server (how to determine the current node ID), and using the auto-postback feature to cause the server side code to execute when a node is selected.
- **Tree Custom-Server-Template**. Alter the markup created by the tree control by binding the data to server controls contained in custom user-controls
- **Tree Custom-Template**. Alter the markup created by the tree control by using custom templates (generated by a custom user-control). Templates should be compatible with the jQuery Templating Plugin.
- **Tree In Repeater**. Uses a tree-control within a repeater's ItemTemplate, using the data that's bound to the repeater.
- **Tree Multi-Select**. Allows more than one node to be selected at a time.
- **Tree Single-Select**. Configures the tree control to allow only a single node to be selected at any time.

```

FolderTree

- **FolderTree**. Adds a control that exposes the CMS folder structure to a page.

  NOTE: The RootId attribute is the starting location for the control, using "0" to begin at the actual CMS root folder; it can be any child folder (for example, set it to the numeric ID of a child folder taken from the workareas folder properties, and the tree will begin there).

- **FolderTree with Ajax**. 9.10 and higher Adds a Folder-Tree control that uses Ajax to fetch the data as needed, reducing the demand placed on the server when a page is first loaded. When the folder tree is very large, the control can defer fetching the data until it is needed. By setting `PageDepth="1"` the tree will get only 1 level below the current level, using an Ajax callback to get the data when a folder that contains children is first opened. By default, the `PageDepth="0"`, which sets no depth-limit and results in the entire tree data being fetched at one time.
- **FolderTree-AjaxCallbackOverride**. Alters the data returned to the tree in code-behind using the tree-controls OnCallback handler.
- **FolderTree Custom-Processor**. 9.10 and higher Adds a custom processor to the control, so that you can manipulate the data.
- **FolderTree-DataDump**. By specifying `DefaultTemplate="DataDump"`, the control will output the data for viewing to aid designers understanding what properties and values are available on each node, to bind with in a template (for example, in a custom template).
- **FolderTree-ItemDataBound**. Adds an OnItemDataBound handler in code-behind that modifies each node's text.
- **FolderTree-Linq**. Expands to, and selects, a target node using LINQ.

  NOTE: This demo assumes that the OnTrek sample site is installed, otherwise the code will have to be tweaked to find folder nodes in your site.

- **FolderTree-PreSerialize**. Adds an OnPreSerializeData handler in code-behind that modifies each nodes text .
- **FolderTree Selections**. Determines which nodes have been selected in code-behind.

- **FolderTree Selections (auto-postback)**. Determines which nodes have been selected in code-behind, also using the tree controls auto-postback feature to automatically update the page when a node is selected.
- **FolderTree-ServerRender**. By specifying `DefaultTemplate="ServerRender"`, the control uses server-side templates to bind with to generate the rendered markup. The server side template uses ASP.NET server controls. You can copy the template to a custom version to alter the markup. If no `DefaultTemplate` is specified, or if it is set to `ClientRender`, then the data is sent to the client side along with templates for binding within the browser using JavaScript and the jQuery Templating Plugin.

  NOTE: While server-side rendering may simplify the creation of custom templates for ASP.NET webform developers, it places additional burdens on the server that may not be the best option for performance reasons.

- **Paged FolderTree**. By specifying the `PageSize` attribute, the control limits the number of folders fetched per parent folder to the given value, and show a link that the user can click to see more folders. You can alter the text of the link using the `PagingText` attribute.

```

MenuTree examples

- **MenuTree**. Adds a control that exposes a CMS Menu structure to the page.

  NOTE: The RootId attribute must be set to the desired CMS menu ID.

- **MenuTree-DataDump**. By specifying `DefaultTemplate="DataDump"`, the control will output the data for viewing to aid designers understanding what properties and values are available on each node, to bind with in a template (for example, in a custom template).
- **MenuTree-ServerRende**r. By specifying `DefaultTemplate="ServerRender"`, the control will utilize server-side templates to bind with to generate the rendered markup. The server side template use ASP.NET server controls. The template can be copied to a custom version to alter the markup. If no DefaultTemplate is specified, or if it is set to ClientRender, then the data is sent to the client side along with templates for binding within the browser using JavaScript and the jQuery Templating Plugin.

  NOTE: While server-side rendering may simplify the creation of custom templates for ASP.NET webform developers, it places additional burdens on the server that may not be the best option for performance reasons.

TaxonomyTree examples

- **TaxonomyTree**. Adds a control that exposes a CMS taxonomy structure to the page.
- **TaxonomyTree (auto-postback)**. Determines which taxonomy nodes have been selected in code-behind, also using the tree controls auto-postback feature, to automatically update the page when a node is selected.
- **TaxonomyTree-DataDump**. By specifying `DefaultTemplate="DataDump"`, the control will output the data for viewing to aid designers understanding what properties and values are available on each node, to bind with in a template (for example, in a custom template).
- **TaxonomyTree-ServerRender**. By specifying `DefaultTemplate="ServerRender"`, the control uses server-side templates to bind with to generate the rendered markup. The server side template uses ASP.NET server controls. You can copy the template to a custom version to alter

the markup. If no `DefaultTemplate` is specified, or if it is set to `ClientRender`, then the data is sent to the client side along with templates for binding within the browser using JavaScript and the jQuery Templating Plugin.

NOTE: While server-side rendering may simplify the creation of custom templates for ASP.NET webform developers, it places additional burdens on the server that may not be the best option for performance reasons.

        if (argument.Ids.Length > 0)
        {
```

```
            string result = "";
            foreach (var id in argument.Ids)
            {
                result += id + " selected" + Environment.NewLine;
            }
            tb1.Text = result;
        }
    }
}
```

ValidationMessage

8.50 and higher

```
<EktronUI:ValidationMessage>
```

Displays the messages that are set in the associated server control's ErrorMessage property.

- Validation rule error messages that are defined for the Control set in the `AssociatedControlID` property are displayed as text for the `<EktronUI:ValidationMessage>` control when error events are triggered.
- This control correctly sets the for attribute of the label element to the form field embedded within an EktronUI control. An asp:Label does not set the for attribute correctly when the `AssociatedControlID` is set on an EktronUI control.
- The markup is always an HTML `<label>` tag. An asp:Label outputs either a `<span>` or a `<label>` tag depending on whether the `AssociatedControlID` property is set or not.

Properties

- **DefaultTemplate**. Gets the name of the Default Template used for rendering the `<EktronUI:TextField>` control.
- **Value**. Strongly typed value accessor.

Events for ValidationMessage

None.

Methods for ValidationMessage

None.

Theming for ValidationMessage

None.

Example for ValidationMessage

Default functionality example

.aspx

```
<ektronUI:Label id="uxTextFieldLabel" AssociatedControlID="uxTextField"
runat="server">Ektron Text Field:</ektronUI:Label>
<ektronUI:TextField ID="uxTextField" runat="server" Text="">
    <ValidationRules>
```

```
        <ektronUI:RequiredRule ErrorMessage="Text is required!" />
    </ValidationRules>
</ektronUI:TextField>
<ektronUI:ValidationMessage ID="validationMessage" runat="server"
AssociatedControlID="uxTextField" /><br />
<ektronUI:Button ID="uxButton" runat="server" Text="Submit" OnClick="uxButton_click"
></ektronUI:Button>
```

.aspx.cs

```
using System;
using Ektron.Site.Developer;

public partial class developer_Framework_UI_Controls_EktronUI_ValidationMessage_
ValidationMessage : SampleControlPage
{
    protected void uxButton_click(Object sender, EventArgs e)
    {

    }
}
```

Wizard

9.00 and higher

```
<EktronUI:Wizard>
```

Simplifies the process of creating multi-step, branching user interfaces. It lets a developer use their Web Forms skills to focus on gathering user input and processing it once, and depend on the wizard to manage the associated page events and form state.

Visually, a wizard is comprised of a list of all available steps, the form for the current step, and a set of buttons to navigate through the process (e.g. next, previous).

A developer implements a wizard by defining a series of steps using EktronUI Step and Summary controls. Any wizard only requires a single step, but a developer may choose to include a summary, define custom property values or assign handlers for its events.

Properties

- `HideStepListing`. Gets or sets a value indicating whether to hide or show the list of names and links to the steps of the wizard. Without this, the wizard does not provide the user with context for the step they are executing.
- `IncludeSummaryInStepListing`. Gets or sets a value indicating whether to include the post-finish summary step in the list of all steps. A user can never skip directly to this step.
- `OnCancelClientClick`. Gets or sets the on client-side code to execute when the user clicks the cancel button. If this code returns false, it will stop the execution of the button click. This is analogous to the `OnClientClick` property of the ASP.Net button.
- `OnCloseClientClick`. Gets or sets the on client-side code to execute when the user clicks the close button. If this code returns false, it will stop the execution of the button click. This is analogous to the `OnClientClick` property of the ASP.Net button.
- `Separator`. Gets or sets the character or string that separates a step's status from its name in the step list.
- `ToolTip`. Gets or sets the text displayed when the mouse pointer hovers over the Web server control.This is passed to the base control, but doesn't have any particular meaning for the Wizard.

Events for Wizard

- `Cancel`. This occurs when the user requests to cancel the wizard. By default, this has no implementation and no Cancel button is shown.

- `Finish`. This occurs after the final non-summary step has been completed, thus completing the wizard. This is the appropriate time to finally process the information entered into the wizard.
- `Start`. This occurs only once when the wizard is loaded onto the page the first time. This provides an opportunity prepare the first step before it is activated as well as any bootstrapping that may be necessary.

Events for Wizard Step

- `CurrentRender`. This occurs when the step is rendered to the page and is useful for operations which only need to occur when the step is displayed (for example, data-binding). This event must be able to repeat without corrupting data.
- `Finish`. This occurs when the user attempts to advance past the step and is when information from the step may be validated. This event must be able to repeat without corrupting data.
- `Start`. This occurs when the step is loaded, whether to be displayed or validated when attempting to advance to a later step. This provides an opportunity to prepare the step for validation (e.g. reflecting changes from earlier steps, changing field visibility, etc). This event must be able to repeat without corrupting data and cannot assume that a step that starts will necessarily remain current.

Methods for Wizard

- `Complete`. Executes the same completion process as would clicking the "Finish" button. If the user is not on the last step, it will advance through every step before executing the Finish event.
- `Exit`. Executes the Cancel event.
- `Go`. Advances or returns the user to the specified step, stopping if necessary due to validation failures.
- `Next`. Advances the user to the next step if the current step is valid and is not the last non-summary step.
- `Previous`. Returns the user to the preceding step if the current step is not the first.

Methods for Wizard Step

- `Activate`. Activates the step, executing the Start event.
- `Complete`. Triggers the step’s completion process: if the form passes validation and the Finish event does not cancel the process, it returns true and allows the Wizard to advance; otherwise it returns false.

Theming for Wizard

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool

to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

NOTE: The Ektron UI Wizard Step only acts as a container for its child controls and does not have any independent markup to theme.

```
<div class="steps">
<ol class="ektron-ui-clearfix">
<li class="completed enabledui-widget ui-state-default">
<a>
<span class="label">Step 1</span>
<span class="separator">:</span>
<span class="status">Choice</span>
</a>
</li>
<li class="current enabledui-widget ui-state-default ui-state-active">
<a><span class="label">Step 2</span></a>
</li>
<li class="pendingui-widget ui-state-default">
<a><span class="label">Step 3</span></a>
</li>
<li class="pending summaryui-widget ui-state-default">
<a><span class="label">Summary</span></a>
</li>
</ol>
</div>
<fieldset class="form">
<legend>Step 2</legend>
<div>…</div>
</fieldset>
<div class="navigation">
<span class="ektron-ui-control ektron-ui-button cancel">
<button aria-disabled="false" role="button" class="ui-button ui-widget ui-state-default
ui-corner-all ui-button-text-icon-primary">
<span class="ui-button-icon-primary ui-icon ui-icon-cancel"></span>
<span class="ui-button-text">Cancel</span>
</button>
</span>
<span class="ektron-ui-control ektron-ui-buttonprevious">
<button aria-disabled="false" role="button" class="ui-button ui-widget ui-state-default
ui-corner-all ui-button-text-icon-primary">
<span class="ui-button-icon-primary ui-icon ui-icon-seek-prev"></span>
<span class="ui-button-text">Previous</span>
</button>
</span>
<span class="ektron-ui-control ektron-ui-buttonnext">
<button aria-disabled="false" role="button" class="ui-button ui-widget ui-state-default
ui-corner-all ui-button-text-icon-secondary">
```

```
<span class="ui-button-text">Start</span>
<span class="ui-button-icon-secondary ui-icon ui-icon-play"></span>
</button>
</span>
<span class="ektron-ui-control ektron-ui-button next">
<button aria-disabled="false" role="button" class="ui-button ui-widget ui-state-default
ui-corner-all ui-button-text-icon-secondary">
<span class="ui-button-text">Next</span>
<span class="ui-button-icon-secondary ui-icon ui-icon-seek-next"></span>
</button>
</span>
<span class="ektron-ui-control ektron-ui-button finish">
<button aria-disabled="false" role="button" class="ui-button ui-widget ui-state-default
ui-corner-all ui-button-text-icon-secondary">
<span class="ui-button-text">Finish</span>
<span class="ui-button-icon-secondary ui-icon ui-icon-check"></span>
</button>
</span>
</div>
```

Examples for Wizard

Wizard has the following variations:

- **Wizard**. Comprised of a list of available steps, the form for the current step, and a set of buttons to navigate through the process (such as, **Next** and **Back**).
- **Wizard Step**. A single step within a series of wizard steps.

Wizard example

.aspx

```
<ektronUI:Wizard ID="uxDemo" runat="server">
    <ektronUI:Step ID="uxNameStep" Name="Name" ValidationGroup="Name" runat="server">
        <StepTemplate>
            <asp:Label ID="uxNameLabel" AssociatedControlID="uxName" Text="Your Name"
runat="server" />
            <asp:TextBox ID="uxName" ValidationGroup="Name" runat="server" />
            <asp:RequiredFieldValidator ID="uxNameRequired" ControlToValidate="uxName"
ErrorMessage="A name must be provided." ValidationGroup="Name" runat="server" />
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Step ID="uxMessageStep" Name="Message" ValidationGroup="Message"
runat="server">
        <StepTemplate>
            <asp:Label ID="uxMessageLabel" AssociatedControlID="uxMessage" Text="Message
to Yourself" runat="server" /><br />
            <asp:TextBox ID="uxMessage" TextMode="MultiLine" ValidationGroup="Message"
runat="server" /><br />
            <asp:RequiredFieldValidator ID="uxMessageRequired"
ControlToValidate="uxMessage" ErrorMessage="A message must be provided."
ValidationGroup="Message" runat="server" />
        </StepTemplate>
    </ektronUI:Step>
```

```
    <ektronUI:Step ID="uxConfirmStep" Name="Confirm" runat="server">
        <StepTemplate>
            <ektronUI:Message DisplayMode="Warning" Text="You're about to send the
configured message to yourself.  Click the finish button to continue." runat="server" />
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Summary ID="uxSummary" Name="Summary" runat="server">
        <StepTemplate>
            <%= uxName.Text %>, <%= uxMessage.Text %>
        </StepTemplate>
    </ektronUI:Summary>
</ektronUI:Wizard>
```

NOTE: .aspx.cs not required.

Wizard Step example

.aspx

```
<ektronUI:Wizard ID="uxDemo" runat="server">
    <ektronUI:Step ID="uxStandard" Name="Standard" OnFinish="uxStandard_Finish"
runat="server">
        <StepTemplate>
            <p>This is a standard step.  The next step is disabled (you can't see
it).</p>
            <asp:CheckBox ID="uxEnableDisabled" Text="Enable next step" runat="server"
/>
            <p>
                The above choice will appear as the status of this step so that the user
                can refer back to it.
            </p>
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Step ID="uxDisabled" Name="Disabled" Disabled="true" runat="server">
        <StepTemplate>
            This step is disabled.  It isn't visible on the page or in the list of steps
            at first, but it could be enabled from code-behind to have it appear.
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Step ID="uxOptional" Name="Optional" Optional="true" runat="server">
        <StepTemplate>
            This step is optional, which means a user can click on a link in the step
list
            after this step from an earlier step.  Note: if this step included form
elements
            that failed validation, the user would still be stopped here.
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Step ID="uxValidated" Name="Validated" ValidationGroup="Validated"
runat="server">
        <StepTemplate>
            This step triggers the validation group "Validated" when the next button is
clicked.
            <asp:DropDownList ID="uxOkay" ValidationGroup="Validated" runat="server">
                <asp:ListItem>Okay?</asp:ListItem>
```

```
                <asp:ListItem>Okay.</asp:ListItem>
            </asp:DropDownList>
            <asp:RequiredFieldValidator ID="uxConfirmRequired"
ControlToValidate="uxOkay" InitialValue="Okay?" Text="Please choose a value from the
dropdown." ValidationGroup="Validated" runat="server" />
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Step ID="uxConfirm" Name="Confirm" runat="server">
        <StepTemplate>
            This is another standard step, but it's the last one before the user can
click finish.
        </StepTemplate>
    </ektronUI:Step>
    <ektronUI:Summary ID="uxSummary" Name="Summary" runat="server">
        <StepTemplate>
            This is the summary step.  Once this is reached the user can't navigate
through the wizard any more.
            This is an opportunity to inform the user of the results of the wizard.  A
summary step is not required.
        </StepTemplate>
    </ektronUI:Summary>
</ektronUI:Wizard>
```

.aspx.cs

```
protected void uxStandard_Finish(object sender, WizardCompleteEventArgs e)
{
    // Set the status based on the user's input
    this.uxStandard.Status =
        this.uxEnableDisabled.Checked ?
        "Enable" :
        "Disable";

    // Enable/disable the "Disabled" step depending on user input
    this.uxDisabled.Disabled = !this.uxEnableDisabled.Checked;
}
```

3

Templated server controls

8.50 and higher

The templated server controls (TSC) let you interact with the following Ektron CMS user controls.

- *AccessPoint* on page 2054. Access Workarea content directly from the Web site.
- *ContentView* on page 2057. Displays a single piece or multiple pieces of content retrieved from the Ektron CMS.
- *FormControl* on page 2062. Displays a single HTML Form retrieved from the Ektron CMS. FormControl loads and executes required form validation and submit functionality.
- *MenuView* on page 2063. Displays menu data retrieved from the Ektron CMS.
- *Search* on page 2082
  - ProductSearch. Lets site visitors search your website for products.
  - SiteSearch. Lets site visitors search your website for content.
  - UserSearch. Lets site visitors search your website for users.
  - XmlSearch. Lets site visitors search Smart Form content on your website.

You can modify the behavior of templated controls by editing their markup. You no longer use Ektron server control properties nor an XSLT to edit the control's behavior. See also: *Modifying the text displayed by templated server controls* on page 2049

You can edit a control's default markup, as well as the markup on any page that contains it.

Customizing a single instance of a templated search server control

1. Open a page in Visual Studio.
2. Drag an InputView or a ResultsView control onto the page. This section uses the SiteSearchResultsView server control as an example.
3. Insert `<ItemTemplate>` tags between the control's opening and closing tags. `<ItemTemplate>` tags instruct the server control to ignore the default properties.

```
<ektron:SiteSearchResultsView ID="SiteSearchInputView1"
  ControllerID="Scontroller" Visible="true" runat="server">
  <ItemTemplate> </ItemTemplate>
</ektron:SiteSearchResultsView>
```

4. Copy the default markup from the control's corresponding .ascx file. Here is a portion of that.

```
<ektron:SiteSearchResultsView ID="SiteSearchInputView1"
  ControllerID="Scontroller" Visible="true" runat="server">
  <ItemTemplate>
    <h1>Search Phrase:<%# Eval("QueryText") %></h1>
    <asp:ListView ID="aspResults" runat="server"
      DataSource='<%# Eval("Results") %>'
```

```
      ItemPlaceholderID="aspPlaceholder">
      <layouttemplate>
        <ul class="results">
          <asp:PlaceHolder ID="aspPlaceholder" runat="server"> |
          </asp:PlaceHolder>
        </ul>
      </layouttemplate>
      <itemtemplate>
        <li class="result ektron-ui-clearfix">
          <h1 class="title">
            <a href="<%# Eval("Url") %>"><%# Eval("Title") %></a>
          </h1>
          <div class="summary">
            <%# Eval("Summary") %>
          </div>
          <span class="url ektron-ui-quiet">
            <%# Eval("Url") %>
          </span>
          <span class="date ektron-ui-quiet">
            <%# Eval("Date") %>
          </span>
        </li>
      </itemTemplate>
    </asp:ListView>
  </Itemtemplate>
</ektron:SiteSearchResultsView>
```

5. Modify the markup to your specifications.

Modifying the default markup

InputView and ResultsView controls have a corresponding .ascx template that contains their default markup. To change a control's default markup, modify its template.

To find a control's template file, open the folder *siteroot*\workarea\FrameworkUI\Templates\Search, and locate the .ascx file that matches the control's name. For example, *siteroot*\workarea\FrameworkUI\Templates\Search\SiteSearchResultsView.ascx.

IMPORTANT: Files stored in the *siteroot*\Workarea folder are overwritten (or deleted) when you upgrade. To avoid problems, back up the files to a folder outside the siteroot\Workarea folder.

NOTE: "Controller"controls only process data. Because they have no UI component, they do not have a template file.

The default .ascx file affects *all* instances of a control on your website. However, you may customize single instances of a control. To do so, see *Customizing a single instance of a templated search server control* on the previous page.

Modifying a templated Control's Markup

Within an `</ItemTemplate>` tag, use an eval statement `<%# Eval() >)` to access Ektron's Search API object and expose its properties to the data binder. For example, `<%# Eval ("QueryText")%>` displays the search term in the search results.

As an example, you can remove the summary from the search results by deleting this line.

```
<div class="summary"><%# Eval("Summary") %></div>
```

Data fields available to an Eval statement

Use an `<%# Eval()>` statement to determine which field properties appear in search results. For example, `<%# Eval("Summary")%>` displays each content item's summary.

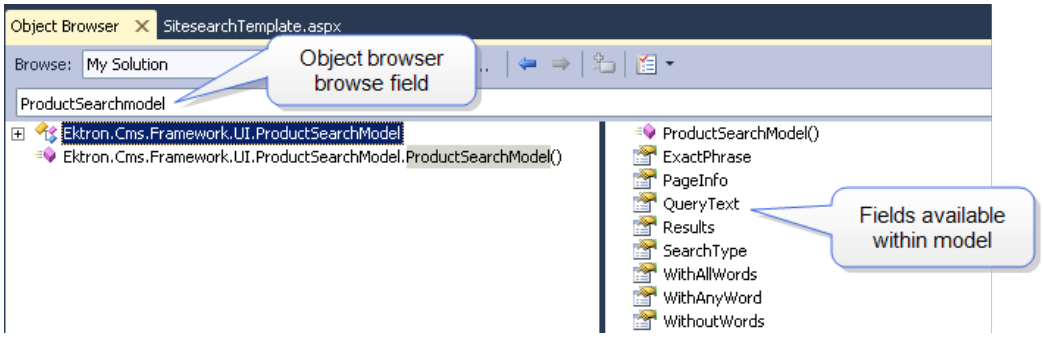
When you insert `<%# Eval()>` between a set of `</ItemTemplate>` tags, a *model* is passed to the statement. Each set of controls has a model that determines available fields and properties. For example, the SearchModel's `Results` property includes these fields:

- Date (late edited)
- Summary
- Title
- Type
- Url

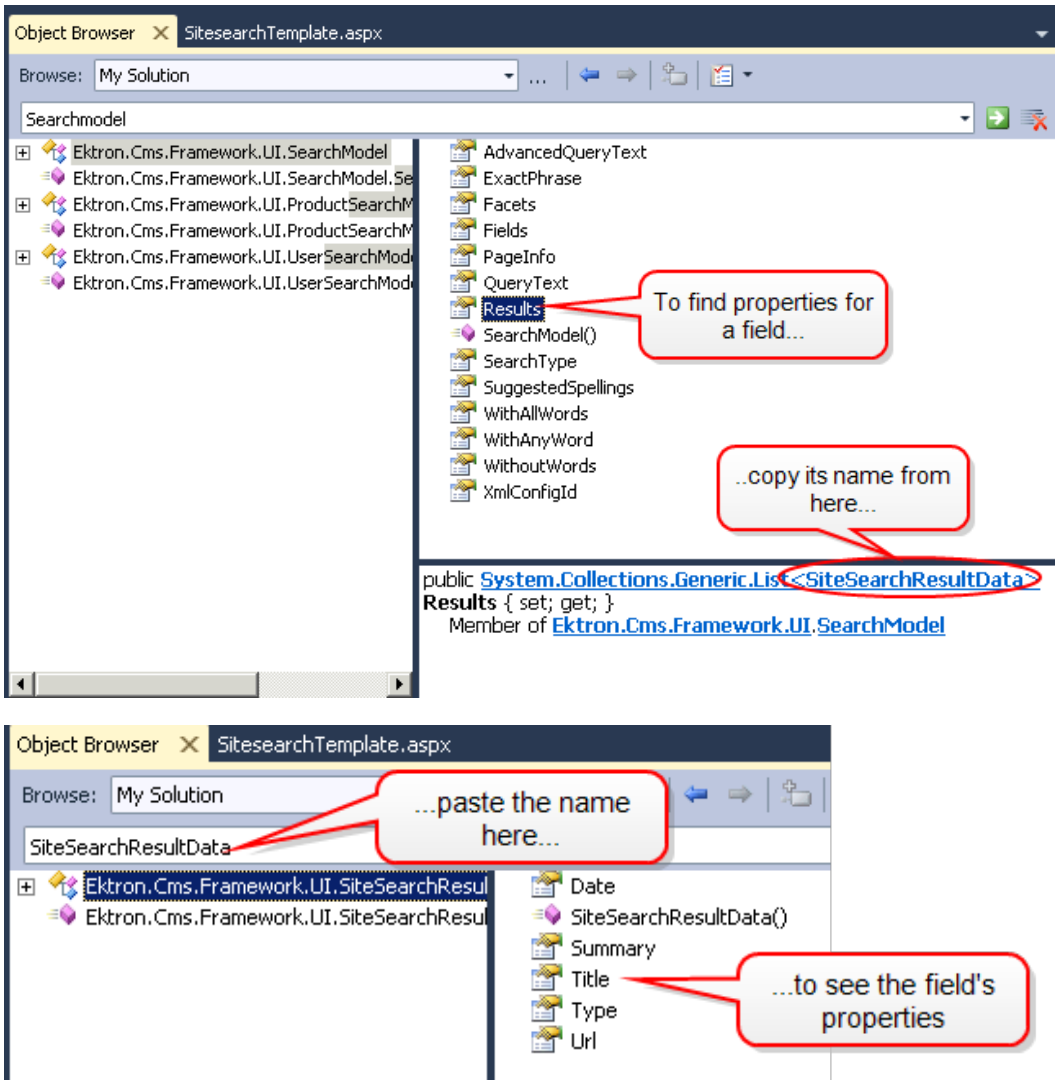
Discovering a model's fields using the object browser

1. Open your Ektron website within Visual Studio.
2. Open the Object Browser.
3. In the **Browse** field, enter the set of controls whose model you want to view. For example, **ProductSearchModel**.

   Other models are **SearchModel** (covers content and XML Smart Forms) and **UserSearchModel**. The model's fields appear in the right pane.



4. To view any field's properties, enter its name into the object browser. Omit the angle brackets (<>).



Modifying the text displayed by templated server controls

To modify the text displayed by a templated control (for example, **no results found**), edit the corresponding .resx file in the *siteroot*\workarea\FrameworkUI\Templates\Search\app_loclaresources folder.

For example, to edit text supplied by the Site Search template, edit *siteroot*\workarea\FrameworkUI\Templates\Search\app_loclaresources\SiteSearchInputView.ascx.resx.

IMPORTANT: Files stored in the *siteroot*\Workarea folder are overwritten (or deleted) when you upgrade. To avoid problems, back up the files to a folder outside the siteroot\Workarea folder.

Injecting your own service

Ektron's templated server controls use an MVC architecture, which is a common design pattern for user interfaces. MVC consists of a

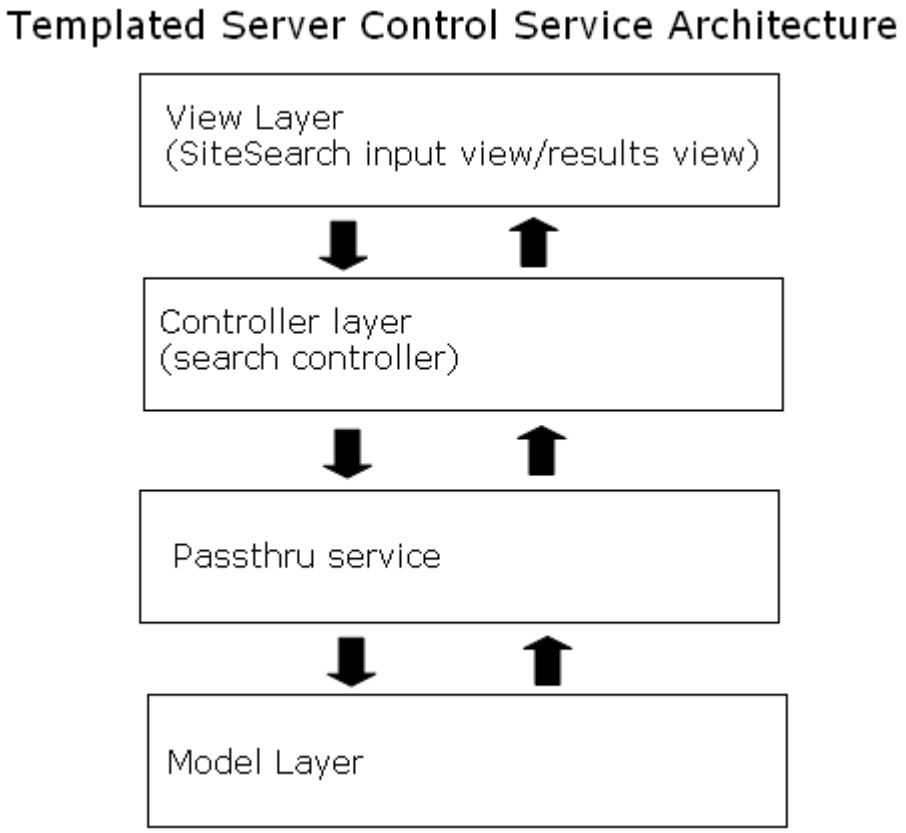
- **M**odel, which stores the state and accesses the application code used by the control; resides in the service layer
- **V**iew, which renders the data
- **C**ontroller, which maps action inputs to the model and elements view; also performs the business logic of the UI

Because MVC architecture separates the display layer from the data layer, a designer can work on the styling of the search results page, while a developer focuses on data being rendered.

Creating a custom service

You can extend the functionality of templated server controls by creating a custom service. For example, you can dynamically replace the content of the search results. You might want to do this to create a profanity filter, or to implement a "blacklist" of replacement terms in search results.

The following image illustrates the location of a custom (passthru) service within MVC architecture.



The passthru service completes these steps.

1. Takes user input from View and Controller Layers.
2. Modifies it.

3. Sends modified data to Model Layer.
4. On the way back, can modify results again.
5. Send results to Controller.
6. Controller pushes results to the View Layer.

Creating a custom service procedure

Use the *siteroot*/`ektron.cms.framework.ui.unity.config` file to map each search type to a service. Below is the section of the file that accomplishes the mapping. By default, Ektron search controls use `ISearch.Service` to take in and return data.

Note separate register statements for regular searches, product searches, and user searches.

NOTE: The ISearchController service handles regular content and XML Smart Form searches.

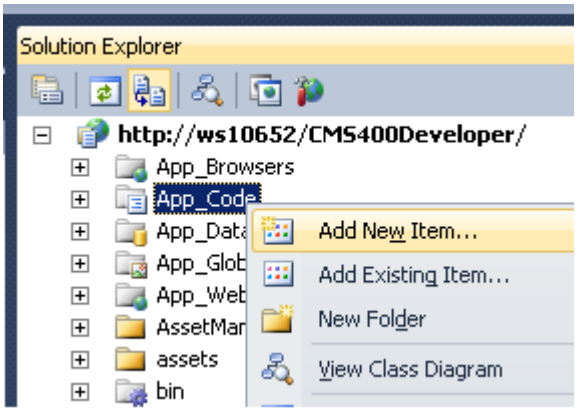
```
<register
  type="Ektron.Cms.Framework.UI.ISearchController, Ektron.Cms.Framework.UI"
  mapTo="Ektron.Cms.Framework.UI.Services.SearchController,
  Ektron.Cms.Framework.UI.Services"/>
<register
  type="Ektron.Cms.Framework.UI.IProductSearchController,
    Ektron.Cms.Framework.UI"
  mapTo="Ektron.Cms.Framework.UI.Services.ProductSearchController,
    Ektron.Cms.Framework.UI.Services"/>
<register
  type="Ektron.Cms.Framework.UI.IUserSearchController,
    Ektron.Cms.Framework.UI"
  mapTo="Ektron.Cms.Framework.UI.Services.UserSearchController,
    Ektron.Cms.Framework.UI.Services"/>
```

Follow these steps to create your own service and map it to a search type.

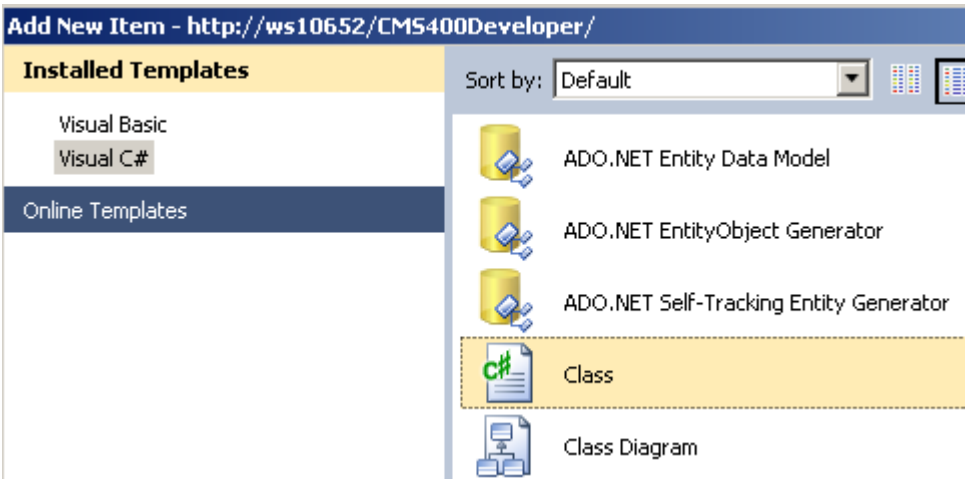
1. In Visual Studio, open *siteroot*/`unity.ui.services.config`.
2. Update the service registration with a new service name. This example assigns to ISearchService a service named DemoSearchService.

   ```
   <register
     type="Ektron.Cms.Framework.UI.ISearchService,
       Ektron.Cms.Framework.UI"
     mapTo="Demo.DemoSearchService"/>
   ```

3. In Solution Explorer, right click the **AppCode** folder and select **Add New Item**.



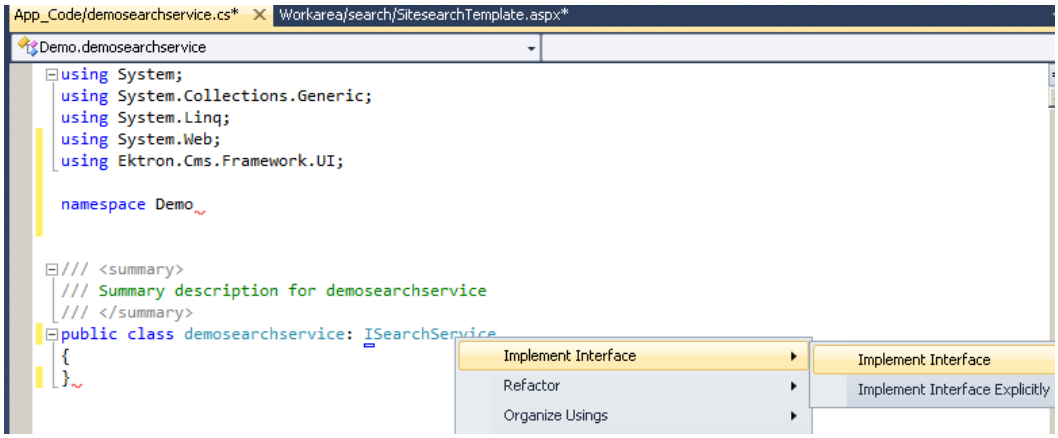
4. Select **C# Class** and give your new service a name.



5. Within the .cs file, insert this statement: `using Ektron.Cms.Framework.UI;`
6. Assign the name of the service that you are overriding. (Service names are listed in `unity.ui.services.config`.)

```
public class DemoSearchService: ISearchService
{
}
```

7. Right click the mouse and select **Implement Interface > Implement Interface**.



8. Several statements are inserted like the following statement, providing inputs to the search service.

```
public void AdvancedSearch(SearchModel model)
{
throw new NotImplementedException();
}
```

9. To create a passthru service, first instantiate the old mock search service. See also: *Creating a custom service* on page 2050

```
public class demosearchservice : ISearchService
ISearchService searchService;
public DemoSearchService()
{
this.searchService= new MockSearchService();
}
```

10. Inside the Advanced, Basic, GetXmlSearchFieldList and XmlSearch methods, call the old service and pass in the same data. For example

```
public void BasicSearch(SearchModel model)
{
this.searchService.BasicSearch(model);
}
```

Now, when you drop inputview and resultsview controls on a page...

- it instantiates the controller.
- it ties the input and results view controls to the controller.
- it instantiates the service, which ties the controller to the service.

Example 1: Any search returns “fifteen” for a result

1. Open the site search template page.
2. Within `SiteSearchResultsView` tags, insert a set of `<itemtemplate>` tags.
3. Within the `<itemtemplate>` tags, insert `<%# Eval(“QueryText”) %>`

```
<ektron:SiteSearchResultsView ID="SiteSearchResultsView1"
  ControllerID="Scontroller" runat="server">
<ItemTemplate> <%# Eval(“QueryText”) %> </ItemTemplate>
</ektron:SiteSearchResultsView \>
```

4. Within the new.cs file that you created in *Creating a custom service procedure* on page 2051, modify the value of `QueryText`. For this example, change the query text to "fifteen." To do this, edit the .cs file, like this.

```
‘Public void BasicSearch(SearchModel model)
{
model.Querytext = “fifteen”; }
```

Example 2: Replace “Summary” with “Ektron” in all results

This example shows how search results may be modified after they are retrieved (that is, on the way back). To do this, edit the .cs file that you created in *Creating a custom service procedure* on page 2051 like this.

```
Public void BasicSearch(SearchModel model)
{
```

```
  model.Results.ForEach(result =>
   { result.Summary = result.Summary.Replace("Summary", "Ektron"); });
}
```

The above code loops through all results (`Results.ForEach`) and replaces "Summary" with "Ektron" in each one.

Example 3: Remove first result

This example shows how to remove the first search result that is retrieved. To do this, edit the .cs file that you created in *Creating a custom service procedure* on page 2051 like this.

```
Public void BasicSearch(SearchModel model)
{
model.Results.RemoveAt(0);
}
```

AccessPoint

8.60 and higher

```
<ektron:AccessPoint>
```

Access Workarea content directly from the Web site. You can assign the access point control to a specific piece of content or a list of content based on taxonomy or collections.

- When assigned to a piece of content, you can edit the content, view the content, or view the content properties.
- When associated with a list of content, you can add items directly to that list.

The Access Point works by itself or in conjunction with other Framework UI controls. You can embed it in a custom template in a templated server control.

Properties for Access Point

- `AddText`. Optional; sets the text to use in place of the default "Add HTML Content" message.
- `ContentType`. Gets or sets the ContentType for the content associated with the control. This will determine what type of content can be added through the access point.
- `DesignTime`. Determines if the control is being rendered in VisualStudio.NET.
- `DisplayType`. Gets or sets the type of menu that is being displayed. For example, Content, Collection, or Folder.
- `FolderId`. Gets or sets the Folder ID where new content will be saved when using the access point. This is used when the DisplayType is Collection or Taxonomy and new content is added.
- `IsPresentationServer`. Gets a flag indicating if the current server is a presentation server.

- `ObjectId`. Gets or sets the Id of the objectthis AccessPoint is associated with. This is directly related to the AccessMenu.DisplayType. If DisplayType is Content, ObjectId should be the Content ID the access point accesses.
- `Title`. Gets or sets the title of the object associated with the access point. This title will be used for display purposes for certain menu types (i.e. content).

Events for Access Point

None.

Methods for Access Point

None.

Theming for Access Point

None.

Examples for Access Point

The Access Point templated server control has the following variations:

- Content
- Collection
- Folder
- Taxonomy

Content example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <ContentFilters>
            <ektron:ContentFilter Field="Id" Operator="EqualTo" Value="30" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:AccessPoint ID="accessPoint" runat="server"
        ObjectId="<%# ContentView1.Model.ContentList.First().Id %>"
DisplayType="Content" />
    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_Default_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Collection example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <CollectionFilters>
            <ektron:ContentCollectionFilter Field="Id" Operator="EqualTo" Value="10" />
        </CollectionFilters>
    </ektron:ContentModelSource>

    <ektron:AccessPoint ID="accessPoint" runat="server"
        ObjectId="10" DisplayType="Collection" FolderId="75" />
    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Folder example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <ContentFilters>
            <ektron:ContentFilter Field="FolderId" Operator="EqualTo" Value="147" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:AccessPoint ID="accessPoint" runat="server" ObjectId="147"
DisplayType="Folder" />
    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Taxonomy example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <TaxonomyFilters>
            <ektron:ContentTaxonomyFilter Field="Id" Operator="EqualTo" Value="208" />
        </TaxonomyFilters>
    </ektron:ContentModelSource>

    <ektron:AccessPoint ID="accessPoint" runat="server" ObjectId="208"
DisplayType="Taxonomy"
        FolderId="147" />
    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
```

```
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

ContentView

8.60 and higher

```
<ektron:ContentView>
```

and

```
<ektron:ContentModelSource>
```

The Content templated server control displays a single piece or multiple pieces of content retrieved from the Ektron CMS.

The ContentView templated server control is actually 2 controls that work together:

- `ContentModelSource`. Specifies the content you want to retrieve. You can use filters (CollectionFilters, ContentFilters, MetadataFilters, and TaxonomyFilters) to display a subset of the content you retrieve.
- `ContentView`. Specifies how you want to display the content.

The ContentView templated server control has 2 templates for rendering:

- `Ektron_Default_Template`. Displays a single piece of content. If the ContentModelSource returns more than 1 piece of content, the first piece in the list is rendered.
- `Ektron_ContentList_Template`. Displays a list of content items. You also can create your own ModelTemplate to customize the rendering of the content.

Attributes for Content

Properties for Content

Ektron.Cms.Framework.UI.Controls.Views.ContentView

- `EktronTemplateName`. Gets the default name of the template.
- `Model`. Current Model.
- `ModelSourceID`. Gets or sets the ID of the controller that retrieves the data.
- `TemplateVirtualPath`. Get TemplateVirtualPath.

Ektron.Cms.Framework.UI.Controls.ContentModelSource

- `CollectionFilters`. CollectionFilter Controls for the ModelSource control.
- `ContentFilters`. Content Filter Controls for the ModelSource control.
- `MetadataFilters`. CollectionFilter Controls for the ModelSource control.
- `ReturnMetadata`. Boolean to return metadata for the ModelSource control.
- `TaxonomyFilters`. Taxonomy Filter Controls for the ModelSource control.

Events for Content

None.

Methods for Content

Examples for Content

The Content templated server control has the following variations:

- CollectionFilters
- Content Item
- Content List
- Custom Item Template
- Custom List Template
- MetadataFilters
- Paging
- TaxonomyFilters

CollectionFilters example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server" OrderByField="Title"
        OrderByDirection="Ascending">
        <Paging RecordsPerPage="3" />
        <CollectionFilters>
            <ektron:ContentCollectionFilter Field="Title" Operator="EqualTo" Value="Our
Team" />
        </CollectionFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Content Item example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <ContentFilters>
            <ektron:ContentFilter Field="Id" Operator="EqualTo" Value="30" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_Default_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Content List example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <Paging RecordsPerPage="3" />
        <ContentFilters>
            <ektron:ContentFilter Field="Path" Operator="StartsWith"
                Value="MainSite/Content/Support/Knowledge Base/" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Custom Item Template example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <ContentFilters>
            <ektron:ContentFilter Field="Id" Operator="EqualTo" Value="30" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource" >
        <ModelTemplate>
            <ektron:AccessPoint ID="accessPoint" runat="server" ObjectId="<%#
ContentView1.Model.ContentList.First().Id %>"
                DisplayType="Content" />
            <div class="ektron-ui-samplecontent">
                <h1><%# ContentView1.Model.ContentList.First().Title %></h1>
```

```
                <h4><%# ContentView1.Model.ContentList.First().EditorFirstName %>
                    <%# ContentView1.Model.ContentList.First().EditorLastName %>
                </h4>

                <div class="ektron-ui-samplecontent-content">
                    <%# ContentView1.Model.ContentList.First().Html %>
                </div>
            </div>
            </ModelTemplate>
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Custom List Template example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server"
OrderByField="DateModified" OrderByDirection="Descending">
        <ContentFilters>
            <ektron:ContentFilter Field="Path" Operator="StartsWith"
Value="MainSite/Content/Community/"/>
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource" >
        <ModelTemplate>
            <div class="ektron-ui-samplecontent">
                    <h3>Last <%# ContentView1.Model.ContentList.Count%> Posts </h3>
                    <asp:ListView ID="contentList" runat="server" DataSource='<%#
ContentView1.Model.ContentList %>'>
                        <ItemTemplate>
                            <h2><a href='<%# Eval("Quicklink") %>'><%# Eval("Title")
%></a></h2>
                            <h4>in <%# Eval("FolderName") %></h4>
                            <%# Eval("Teaser")%>
                        </ItemTemplate>
                    </asp:ListView>
            </div>
            </ModelTemplate>
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

MetadataFilters example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server" OrderByField="Title"
        OrderByDirection="Ascending">
        <Paging RecordsPerPage="3" />
        <MetadataFilters>
            <ektron:ContentMetadataFilter TypeName="Keywords" Operator="Contains"
```

```
                Value="software" />
        </MetadataFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

Paging example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server">
        <Paging RecordsPerPage="2" />
        <ContentFilters>
            <ektron:ContentFilter Field="Path" Operator="StartsWith"
Value="MainSite/Content/Support/Knowledge Base/" />
        </ContentFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource" EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
    <ektronUI:Pager ID="contentPager" runat="server"
PageableControlID="contentModelSource" />
```

NOTE: .aspx.cs not required.

TaxonomyFilters example

.aspx

```
<ektron:ContentModelSource ID="contentModelSource" runat="server"
OrderByField="DateCreated"
        OrderByDirection="Descending">
        <Paging RecordsPerPage="3" />
        <ContentFilters>
            <ektron:ContentFilter Field="DateCreated" Operator="GreaterThan"
Value="07/17/2010" />
        </ContentFilters>
        <TaxonomyFilters>
            <ektron:ContentTaxonomyFilter Field="Path" Operator="StartsWith"
                Value="\OnTrek Site Navigation\Company" />
        </TaxonomyFilters>
    </ektron:ContentModelSource>

    <ektron:ContentView ID="ContentView1" runat="server"
ModelSourceID="contentModelSource"
        EktronCustomTemplate="Ektron_ContentList_Template" >
    </ektron:ContentView>
```

NOTE: .aspx.cs not required.

FormControl

8.60 and higher

```
<ektron:FormControl>
```

The FormControl templated server control displays a single HTML Form retrieved from the Ektron CMS. FormControl loads and executes required form validation and submit functionality.

Properties for FormControl

- **`DefaultFormId`**. Sets the HTML Form to render if `DynamicParameter` is unspecified or the parameter contains no value.
- **`DynamicParameter`**. Sets the URL `QueryString parameter` (default is `ekfrm`) that is used to dynamically load HTML Form data into this control.

Events for FormControl

None.

Examples for FormControl

FormControl example

.aspx

```
<ektron:FormControlID="formControl"runat="server"
  DefaultFormId="1234"DynamicParameter="ekfrm"/>
```

NOTE: .aspx.cs not required.

MenuView

8.60 and higher

```
<ektron:MenuView>
```

The MenuView templated server control is used to display menu data retrieved from the Ektron CMS. It can display a single list of menu nodes as well as their child menu items. It can also be used to recursively display submenus and build a tree structure.

The MenuView templated server control is actually 2 controls that work together:

- **MenuModelSource.** Specifies the menu data that you want to retrieve.
- **MenuView**. Specifies how you want to display the menu.

Properties for MenuView

- **`TreeFilter`.** Gets the embedded Paging Control for the Model Source control.

itemselected='<%# Eval("Selected") %>' />
                        </li>
                    </ItemTemplate>
                </ektron:MenuView>
            </div>
            <div style="clear: both;">
                <br /><br />
                NOTES:
                <ul>
                    <li>
                        This demo requires a menu in the CMS; be sure to set the
MenuModelSource-TreeFilter
                        Id to the proper menu (if using OnTrek, there is a sample menu
with Id 39).
                    </li>
                    <li>
                        To make the secondary menu work when this code is copied to
                        a test page, you will need either change the link for "Framework
                        UI" (under menu "Sample Developer Master Slave Menu")
                        from
"/OnTrek//developer/framework/ui/controls/TemplatedServerControls/MenuView/ParentChildMen
u.aspx?sample=FrameworkUI"
                        to the URL and querystring for your test page, or add a new child
menu
                        with the URL set to the URL and querystring for your test page
(and add
                        any child nodes that you want to show up in the secondary menu).
```

```
                    </li>
                </ul>
            </div>
        </form>
    </body>
</html>
```

.aspx.cs

IMPORTANT: Regarding the following code near the end of this sample:

```
 //LoadData needs to be called to reload Views, but its protected.
 uxSecondaryMenuSource.GetType().GetMethod("LoadData",
System.Reflection.BindingFlags.NonPublic |
System.Reflection.BindingFlags.Instance |
System.Reflection.BindingFlags.FlattenHierarchy).Invoke
(uxSecondaryMenuSource, new object[] { });
```

In 9.10 SP2 and later releases, you must replace it with the following. The new code does not work with 9.10 SP1 or earlier.

```
void MainMenu_MenuItemChanged(object sender, ParentChildMenuEventArgs
menuEventArgs)
{
 //Initialize Menu Source
 uxSecondaryMenuSource.TreeFilter.Id = menuEventArgs.CurrentMenuItemId;
 uxSecondaryMenuSource.TreeFilter.Depth = 1;
 uxSecondaryMenuSource.LoadData();
}
```

```

        // URL ContentId exists in the Menuitems then Select it.
        if (this.ContentId > 0 && !string.IsNullOrEmpty(e.Item.Id))
        {
            if (e.Item.Items != null && e.Item.Items.Any())
            {
                foreach (Ektron.Cms.Framework.UI.Controls.EktronUI.MenuTreeNode x in
e.Item.Items)
                {
                    if (x.ItemId == this.ContentId.ToString())
                    {
                        // You can manipulate menu item properties here.
                        x.Selected = true;
                        x.Expanded = true;
                        e.Item.Expanded = true;

                        // Firing the MenuItemChangedHandler Event
                        if (MenuItemChanged != null)
                        {
                            MenuItemChanged(this, new SmartMenuEventArgs {
CurrentMenuItemId = Convert.ToInt64(x.ItemId) });
                        }
                    }
                    else
                    {
                        x.Selected = false;
                        x.Expanded = false;
                    }
                }
            }
        }

        // Expand SubMenu Based up on the Associated folders.
        if (e.Item.Type != null && e.Item.Type.ToLower() == "submenu")
        {
            var submenudata =
(Ektron.Cms.Framework.UI.Controls.EktronUI.MenuTreeNode)e.Item;
            if (Content != null && submenudata.AssociatedFolders.Contains
(Content.FolderId))
            {
                e.Item.Expanded = true;
                e.Item.Selected = true;
            }
        }
    }
```

```
    protected void MainMenu_MenuItemChanged(object sender, SmartMenuEventArgs
menuEventArgs)
    {
        // custom code can utilize this event...

    }
}
```

Search

8.50 and higher

There are several types of search templated server controls:

- ProductSearch. Lets site visitors search your website for products.

  IMPORTANT: Ektron has discontinued new development on its eCommerce module. If you have a license to eCommerce, you will continue to receive support, but if you need to upgrade, contact your account manager for options.

- SiteSearch. Lets site visitors search your website for content.
- UserSearch. Lets site visitors search your website for users.
- XmlSearch. Lets site visitors search Smart Form content on your website.

The Product, Site, User, and Xml search templated server controls let you:

- exercise more granular control over each function.
- customize display of input and results using standard CSS markup.
- eliminate XSLTs. Use ASP.NET templates to control markup.
- use several search `InputView` or search `ResultsView` controls on a template.

Search templated server controls are more specialized than their predecessors, which typically used 1 control to retrieve and display results. To provide search functionality, use 3 templated controls.

Each type of search server control consists of three templated controls and has the following relationship:

1. `[type of search]InputView` (input). Accepts user input of search terms.
2. `[type of search]Controller` (process). Takes input from InputView control and retrieves search results.
3. `[type of search]ResultsView` (output). Shows search results; you can modify the results' display, and so on.

The following example shows this relationship using site search controls.

To replicate all of the previous search server controls' functionality, use a combination of templated controls. For example, use the Pager control to manage the paging of search results. Also, use the Advanced Query Text parameter to limit results to those in a selected folder, in a selected taxonomy category, and so on.

Search server controls have no Ektron-specific properties. In contrast, the pre-8.5 Search server control properties let you configure language, Display XSLT, folder ID, and so on.

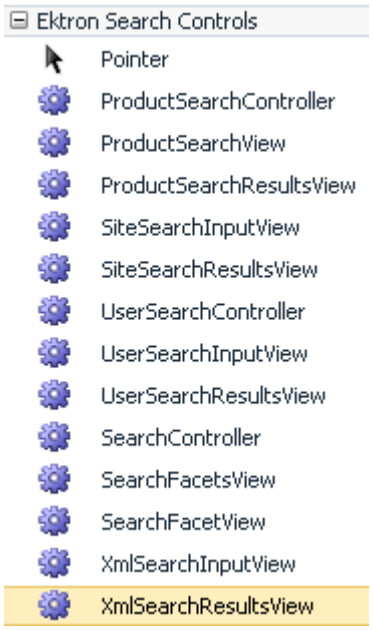
- ASP.NET Data-Bound Web server controls

Adding search server controls to Visual Studio

1. Open your Ektron project in Microsoft Visual Studio 2010.
2. Open the Visual Studio Toolbox.
3. Add a tab and give it a name like `Ektron Search`.
4. Click **Choose Items...**.
5. Click **Browse**.
6. Choose *siteroot*/bin/**Ektron.Cms.Framework.UI.Controls.dll**.
7. Click **OK**. The controls appear on the Toolbox tab.



You should also add EktronUI controls to the Visual Studio toolbox. See *Installing server controls into Visual Studio Toolbox* on page 2135.

Customizing the search behavior with AdvancedQueryText

The AdvancedQueryText parameter lets you customize the behavior of the search controller. As examples, you can restrict search results to

- content properties, such as
  - content in a folder, or a folder and all of its child folders. See also: Recursive Folder Queries.
  - Spanish-language content

- user properties, such as
  - tags set to "Race Car Fans"
  - email address includes "widgets.com"
- eCommerce product properties, such as
  - catalog number is between 1 and 10,000
  - sale price is less than $50 US

The following `AdvancedQueryText` statement restricts search results by language and folder. (It assumes a SiteSearchController named `siteSearchController1` is defined on my page.)

```
<ektron:SiteSearchController ID="siteSearchController1"></ektron:SiteSearchController>
```

Set the `AdvancedQueryText` property in the code-behind for that page. The value assigned to `AdvancedQueryText` is appended to the user's input.

Allowed Operators in the AdvancedQueryText Parameter

- equals (=)
- greater than (>)
- less than (<)
- contains (:)

Retrieving Folder vs. FolderPath

See also: Recursive Folder Queries.

- `folderid`. Identify the folder that contains the content. For example: `folderid:10`

```
protected void Page_Init(object sender, EventArgs e)
  {
    siteSearchController1.AdvancedQueryText = string.Format(
       "({0}:1033 AND {1}:10)",
       Ektron.Cms.Search.SearchContentProperty.Language.Name,
       Ektron.Cms.Search.SearchContentProperty.FolderId.Name);
  }
```

- `folderidpath`. Identify the folder path that contains the content. For example: `folderidpath: "121/71/78/94/10"`

```
protected void Page_Init(object sender, EventArgs e)
  {
    siteSearchController1.AdvancedQueryText = string.Format("({0}={1}) AND {2}:{3}",
    Ektron.Cms.Search.SearchContentProperty.ContentType, 1,
    Ektron.Cms.Search.SearchContentProperty.FolderIdPath, "121/71/78/94/10");
  }
```

NOTE: To exclude a folder but include all of its child folders, use `(folderidpath:"121/71/78/94/10" AND NOT folderid:121)`

Using Solr in Ektron version 9.3

When using the Solr search provider in Ektron version 9.3, the FolderId, FolderPath, and TaxonomyPath `.Contains` syntax acts like a `startswith` expression instead of a `Contains` one. Examples:

FolderIdPath examples

- `FolderIdPath .Contains "72/"` returns content in folder 72 and subfolder 73
- `FolderIdPath .Contains "72/73/"` returns content in folder 73
- `FolderIdPath .Contains "73/", "73", "/73/"` returns no content

Taxonomy examples

- `TaxonomyPath .Contains "12/"` returns content in category 12 and sub-category 13
- `TaxonomyPath .Contains "12/13/"` returns content in sub-category 13
- `TaxonomyPath .Contains "73/", "73", "/73/"` returns no content

Exception:

- `FolderIdPath or TaxonomyPath .Contains "/"` returns content in the root folder/taxonomy only

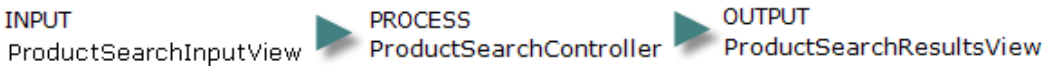
ProductSearch

8.50 and higher

```
<TSC:ProductSearch>
```

IMPORTANT: Ektron has discontinued new development on its eCommerce module. If you have a license to eCommerce, you will continue to receive support, but if you need to upgrade, contact your account manager for options.

The ProductSearch templated server control lets site visitors search your website for products. ProductSearch consists of the following components:



- `ProductSearchInputView`. Accepts user input of search terms.
- `ProductSearchController`. Takes input from `ProductSearchInputView` control and returns search results.
- `ProductSearchResultsView`. Shows search results; you can modify the results' display, paging and so on.

Input and output markup

`InputView` and `ResultsView` controls have a corresponding `.ascx` template that contains default markup. You can modify a template to change a control's default markup. You can find the search control template files at the following locations:

```
[site root]\workarea\FrameworkUI\Templates\Search\ProductSearchInputView.ascx
[site root]\workarea\FrameworkUI\Templates\Search\ProductSearchResultsView.ascx
```

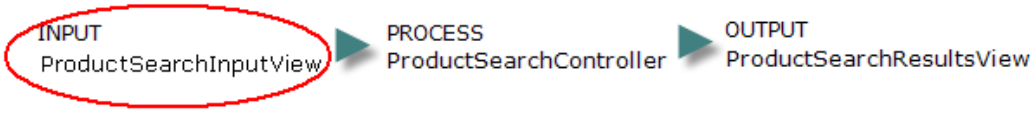
Process controller

The `Controller` control takes input from an `InputView` control, and returns search results to a `ResultsView` control. It provides an interface to the search API,

giving search view controls access to search data. The `Controller` control executes a search using a query string from search `InputView` control's `Text` property, as specified in the code-behind's `OnClick` event. You may modify the `Controller` or write your own.

Unlike the other search controls, the `Controller` control has no UI functionality.

ProductSearchInputView



Use the ProductSearchInputView server control to search eCommerce Products. It provides a Basic and an Advanced search. The query string from the ProductSearchInputView control is passed to the ProductSearchController, which sends results to the ProductSearchResultsView.

- You can place the ProductSearchInputView server control anywhere on a page, and it can be separated from the results display.
- More than 1 ProductSearchInputView server control can reside on a page.
- See also: *Properties for ProductSearchInputView* on page 2089.
- To customize ProductSearchInputView, use the same process outlined in *Customizing the SiteSearchInputView control* on page 2095.

The following image shows the default template for this control.

Click the Advanced link to show these product search filters.

- With all words
- Without words
- Exact Phrase
- With any word

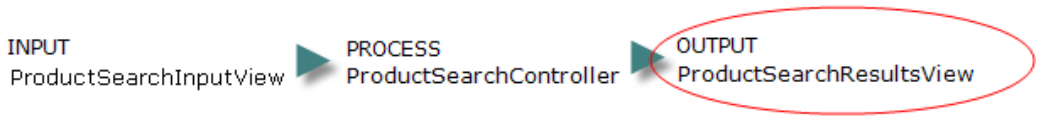
ProductSearchController

The ProductSearchController server control takes input from a ProductSearchInputView control, and returns results to a ProductSearchResultsView control. It provides an interface to the search API, thereby giving SearchView controls access to search data.

- You can modify Ektron's ProductSearchController or write your own.

- The ProductSearchController executes a search using a query string from the ProductSearchInputView control's `Text` property, as specified in the code-behind's `Onclick` event.
- Unlike the other search controls, ProductSearchController has no UI functionality. So, there is no corresponding .ascx file.
- Use only 1 ProductSearchController per page.
- See also: *Properties for ProductSearchController* on page 2089.

ProductSearchResultsView

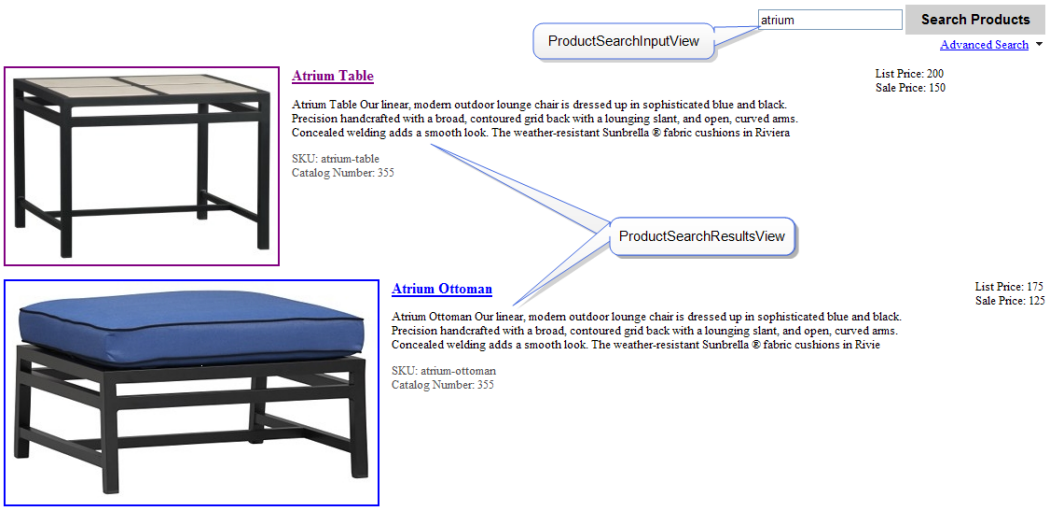


Use the SearchResultsView server control to show search results sent from a ProductSearchController.

The ProductSearchResultsView is tied to the ProductSearchController by setting the property ControllerID.

See also: *Properties for ProductSearchResultsView* on page 2089.

The following image shows the ProductSearchView's search field and button and search results using the ProductSearchResultsView server control's default template. To see an example of displaying user search results, see `[siteroot]\workarea\FrameworkUI\Templates\Search\ProductSearchResultsView.ascx`.



Inserting ProductSearch Templated server controls

To provide search capabilities to your website content, insert all 3 components of the ProductSearch templated server control onto an .aspx template. Because the search functions are managed by separate controls, you can place a search field and button in a one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only 10 results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

PREREQUISITE

Search server controls were added to the Visual Studio Toolbox. See *Adding search server controls to Visual Studio* on page 2083.

If you drag and drop controls from the Visual Studio Toolbox, the necessary `register` statements are copied from the `web.config` file and added to the page.

```
<add tagPrefix="ektron" namespace="Ektron.Cms.Framework.UI.Controls"
  assembly="Ektron.Cms.Framework.UI.Controls, Version=8.5.0.356,
  Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
<add tagPrefix="ektronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  assembly="Ektron.Cms.Framework.UI.Controls.EktronUI,
  Version=8.5.0.356, Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
```

If you copy and paste the sample code, add the following `register` statement for templated controls:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls"
  tagprefix="ektron" %>
```

For Ektron UI controls, use this `register` statement:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>
```

The tag prefix can be anything as long as it matches the control's prefix.

The following template shows the 3 components of the ProductSearch templated server control.

```
<%@ Page Language="C#" AutoEventWireup="true"
  CodeFile="TemplatedControl.aspx.cs"
  Inherits="TemplatedControl" ValidateRequest="false" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls" tagprefix="ektron" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
      "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head runat="server">
       <title></title>
</head>
  <body>
    <form id="form1" runat="server">
     <div>
       <ektron:ProductSearchInputView ID="ProductSearchInputView1"
          ControllerID="ProductSearchController1" runat="server">
       </ektron:ProductSearchInputView>
```

```
      <ektron:ProductSearchController ID="ProductSearchController1"
        runat="server" />
      <ektron:ProductSearchResultsView
        ControllerID="ProductSearchController1"
        ID="ProductSearchResultsView1" runat="server">
      </ektron:ProductSearchResultsView>
       <ektronUI:Pager ID="pager1" runat="server"
        PageableControlID="ProductSearchController1" ResultsPerPage="10">
      </ektronUI:Pager>
    </div>
   </form>
  </body>
</html>
```

Properties for ProductSearchInputView

- `ControllerID`. The *ID* of the ProductSearchController that provides the data.

```
<CMS:ProductSearchInputView ID="ProductSearchView1"
  ControllerID="ProductSearchController1" runat="server">
</CMS:ProductSearchInputView>
<CMS:ProductSearchController ID="ProductSearchController1"
  runat="server" />
```

- `ExactPhrase`. Sets an EXACT ORDER relationship among search terms.
- `QueryText`. The string used for searching.
- `SearchType`. 1 of the following:
  - Advanced
  - Basic
  - None
  - XmlSearch
- `WithAllWords`. Sets an AND relationship among search terms.
- `WithAnyWord`. Sets an OR relationship among search terms.
- `WithoutWords`. Sets a NOT relationship among search terms.

Properties for ProductSearchController

- `AdvancedQueryText` (Optional). See *Customizing the search behavior with AdvancedQueryText* on page 2083.
- `ID` (Required). Provides the association for the SiteSearchInputView and SiteSearchResultsView server controls. Here is an example of the ID property with the SiteSearchController.

```
<ektron:SiteSearchController ID="SiteSearchController1"
  runat="server" />
```

Properties for ProductSearchResultsView

- `ControllerID`. The *ID* of the UserSearchController that provides the data.

```
<CMS:ProductSearchResultsView ID="ProductSearchView1"
  ControllerID="ProductSearchController1" runat="server">
</CMS:ProductSearchResultsView>
<CMS:ProductSearchController ID="ProductSearchController1"
  runat="server" />
```

- `PageInfo`. Displays information about search result numbers, such as **Displaying results 11 through 20 of 35**.
  - `CurrentPageIndex`. Current page.
  - `EndCount`. Number of results found.
  - `NumberOfPages`. Number of results divided by results per page.
  - `PageCount`. Number of the page being viewed currently.
  - `ResultCount`. Number of the results returned for the search terms.

    IMPORTANT: The result count is only an estimate. The count becomes more accurate you get closer to the final page.

  - `ResultsPerPage`. Number of results displayed per page.
  - `StartCount`. 1.
- `QueryText`. The string used for searching.
- `Results`. The fields returned of ProductSearchResultsData. Display these inside a ListView or Repeater.
  - Catalog Number
  - ImageUrl
  - ListPrice
  - ProductID
  - SalePrice
  - SKU
  - Summary
  - Title
  - URL
- `SearchType`. 1 of the following:
  - Advanced
  - Basic
  - None
  - XmlSearch
- `State`. 1 of the following:
  - initialized. Search has not been run yet
  - no results. No search results were returned
  - search results. Search results were returned

Events for ProductSearch

None.

Methods for ProductSearch

- `Search(string queryText, string advancedQueryText)`
  - Description: Basic search
    - `queryText`. The text you have in the INPUT text box.

        - `advancedQueryText`. The extra query text that is appended to the end of the `queryText`, which you do not want to show on the INPUT text box.
    - Return Type: None.
- `Search(string withAllWords, string withoutWords, string withAnyWord, string exactPhrase, string advancedQueryText)`
    - Description: Advanced search
        - includes `withAllWords`, `withoutWords`, `withAnyWord` and `exactPhrase`.
        - `advancedQueryText`. The extra query text that is appended to the end of the queryText, which you do not want to show on the INPUT text box.
    - Return Type: None.

Theming for ProductSearch

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxProductSearchInput" class="ektron-ui-control
  ektron-ui-search ektron-ui-search-products">
  <div class="basicSearch">
    <span class="ektron-ui-control
      ektron-ui-input
      ektron-ui-textField"
      id="uxProductSearchInput_ctl00_0_uxSearchText_0_TextField_0_
        uxTextField_0">
    <input type="text"
      id="uxProductSearchInput_ctl00_0_uxSearchText_0_TextField_0_
        aspInput_0"
      name="uxProductSearchInput$ctl00$ctl00$uxSearchText$TextField$
        aspInput">
    </span>
    <span class="ektron-ui-button">
    <input type="button" autocomplete="off" value="Search Products"
       title=""
       onclick="WebForm_DoPostBackWithOptions
         (new WebForm_PostBackOptions
         ('uxProductSearchInput$ctl00$ctl00$uxBasicSearchButton', '',
         true, '', '', false, true));"
       name="uxProductSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
       id="uxProductSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
       class="ui-button ui-widget ui-state-default ui-corner-all"

Example for ProductSearch

.aspx

```
<ektron:ProductSearchInputView ID="uxProductSearchInput"
  ControllerID="uxSearchController" runat="server">
</ektron:ProductSearchInputView>
<ektron:ProductSearchResultsView ID="uxProductSearchResults"
  ControllerID="uxSearchController" runat="server">
</ektron:ProductSearchResultsView>
<ektron:ProductSearchController ID="uxSearchController" runat="server">
</ektron:ProductSearchController>
```

SiteSearch

8.50 and higher

```
<TSC:SiteSearch>
```

The SiteSearch templated server control lets site visitors search your website. SiteSearch consists of the following components:

- `SiteSearchInputView`. Accepts user input of search terms.
- `SiteSearchController`. Takes input from `SiteSearchInputView` control and returns search results.
- `SiteSearchResultsView`. Shows search results; you can modify the results' display, paging and so on.

To provide search capabilities for your Web site content, insert all three controls onto an `.aspx` template. Because the search functions are managed by separate controls, you can place a search field and button in one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only ten results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

Input and output markup

`InputView` and `ResultsView` controls have a corresponding `.ascx` template that contains default markup. You can modify a template to change a control's default markup. You can find the search control template files at the following locations:

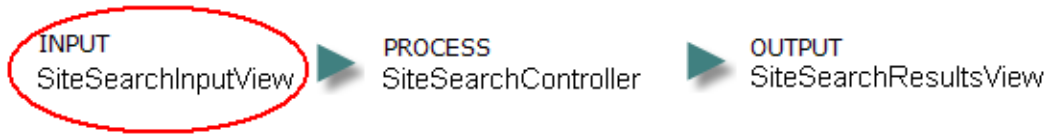
```
[site root]\workarea\FrameworkUI\Templates\Search\SiteSearchInputView.ascx
[site root]\workarea\FrameworkUI\Templates\Search\SiteSearchResultsView.ascx
```

Process controller

The `Controller` control takes input from an `InputView` control, and returns search results to a `ResultsView` control. It provides an interface to the search API, giving search view controls access to search data. The `Controller` control executes a search using a query string from search `InputView` control's `Text` property, as specified in the code-behind's `OnClick` event. You may modify the `Controller` or write your own.

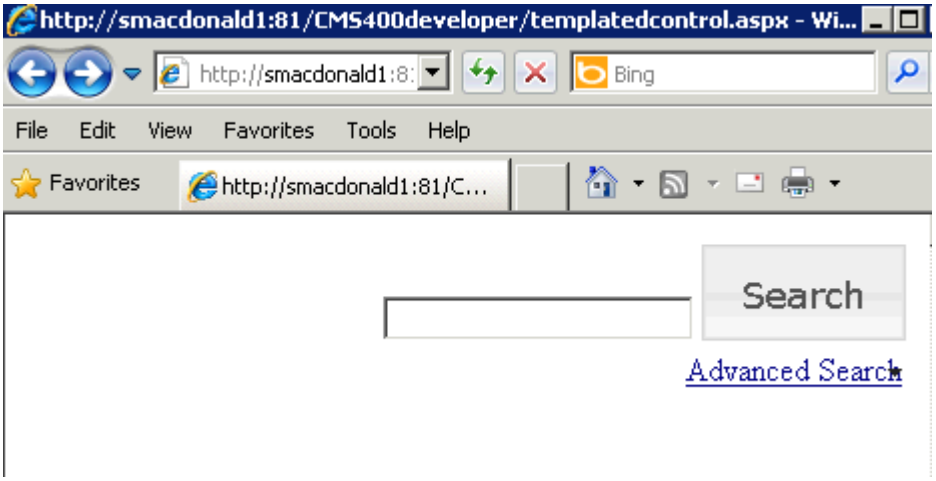
Unlike the other search controls, the `Controller` control has no UI functionality.

SiteSearchInputView



The SiteSearchInputView server control provides a text box and submit button, which visitors use to search content. The control contains no business logic. It merely accepts a search term and passes it to the SiteSearchController, which retrieves and sends results to the SiteSearchResultsView control. See also: *Properties for SiteSearchInputView* on page 2101.

The SiteSearchInputView control's main purpose is a placeholder for markup, which you use to modify its appearance. The control's default markup is very simple: it inserts a text box, a Search button, and an **Advanced Search** link.



To enable search functionality, connect a SiteSearchController to a SiteSearchInputView control. Use the control's `ControllerID` property to do this. As a `value` for the `ControllerID` property, enter the ID of the SiteSearchController that you place within the `<form>` tags. For example:

```
<ektron:SiteSearchInputView ID="SiteSearchInputView1"
  ControllerID="SiteSearchController1" runat="server">
</ektron:SiteSearchInputView>
```

This section also contains the following topics.

Placing a SiteSearchInputView server control on a page

You added search server controls to the Visual Studio Toolbox.

To place a SiteSearchInputView control on a page:

1. Open the page in Visual Studio.
2. Drag and drop the SiteSearchInputView control.

You can place the SiteSearchInputView control anywhere on a page -- it does not need to be next to the results. Also, you can place several SiteSearchInputView controls on a page.

Customizing the SiteSearchInputView control

1. Add a set of `<ItemTemplate>` tags between the SiteSearchInputView control's opening and closing tags. Then, insert an asp text box or an `EktronUI:TextField` to accept the user's input. Here is an example.

```
<ektron:SiteSearchInputView ID="SiteSearchInputView1"
  ControllerID="SiteSearchController1" runat="server">
  <ItemTemplate>
    <ektronUI:TextField ID="queryText" Text='<%# Eval("QueryText") %>'
      runat="server"></ektronUI:TextField>
```

```
  </ItemTemplate>
</ektron:SiteSearchInputView>
```

NOTE: As an alternative, you can copy the line that inserts a text box from *siteroot*\Workarea\FrameworkUI\Templates\Search\SiteSearchInputview.ascx.

Note that the Eval statement (`<%# Eval("QueryText") %>`) databinds the search term to the textbox. As a result, the term remains in the box after the user clicks the search button.

2. Insert an asp search or `EktronUI:Button`, like this.

```
<ektron:SiteSearchInputView ID="SiteSearchInputView1"
ControllerID="SiteSearchController1" runat="server"> <ItemTemplate>
<ektronUI:TextField ID="queryText" Text='<%# Eval("QueryText") %>'
runat="server"></ektronUI:TextField> <ektronUI:Button ID="Button1"
DisplayMode="button" Text="Button 1" runat="server" OnClick="Button1_Click">
</ektronUI:Button> </ItemTemplate>
</ektron:SiteSearchInputView>
```

NOTE: As an alternative, you can copy the line that inserts a search button from *siteroot*\Workarea\FrameworkUI\Templates\Search\SiteSearchInputview.ascx.

3. Assign to the button an `onclick` event that executes a search. To accomplish this, open the page's code-behind file and add the following code.

```
protected void searchButton_Click(object sender, EventArgs e)
  { SiteSearchController1.Search (queryText.Text); }
```

Now you can customize the control's markup as needed.

See also: MSDN Button class, MSDN Textbox class

Separating the search field from the results display

You can place the search field and button on different parts of the page. To do that, insert 2 SiteSearchInputView controls. In one control, place the search field, like this.

```
<ektron:SiteSearchInputView ID="SiteSearchInputView1"
  ControllerID="Scontroller" Visible="true" runat="server">
  <ItemTemplate>
       <ektronUI:TextField ID="queryText" Text='<%# Eval("QueryText") %>'
          runat="server"></ektronUI:TextField>
  </ItemTemplate>
</ektron:SiteSearchInputView>
```

In the second control, in another section of the page, place the button, like this.

```
<ektron:SiteSearchInputView ID="SiteSearchInputView2"
  ControllerID="Scontroller" Visible="true" runat="server">
  <ItemTemplate>
       <ektronUI:Button ID="Button1" DisplayMode="button" Text="Button 1"
         runat="server" OnClick="Button1_Click">
       </ektronUI:Button>
  </ItemTemplate>
</ektron:SiteSearchInputView>
```

Then, assign an onclick event to the button that executes a search. To accomplish this, open the page's code-behind file and add the following code.

```
protected void searchButton_Click(object sender, EventArgs e)
  {
```

```
    SiteSearchController1.Search (queryText.Text);
  }
```

SiteSearchController

The SiteSearchController server control takes input from a SiteSearchInputView control, and returns results to a SiteSearchResultsView control. It provides an interface to the search API, thereby giving SearchView controls access to search data. See also: *Properties for SiteSearchController* on page 2102.

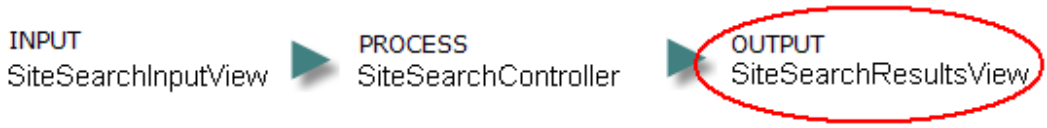
You can modify Ektron's SiteSearchController or write your own.

Use only 1 SiteSearchController per page.

The SiteSearchController executes a search using a query string from the SiteSearchInputView control's `Text` property, as specified in the code-behind's `Onclick` event.

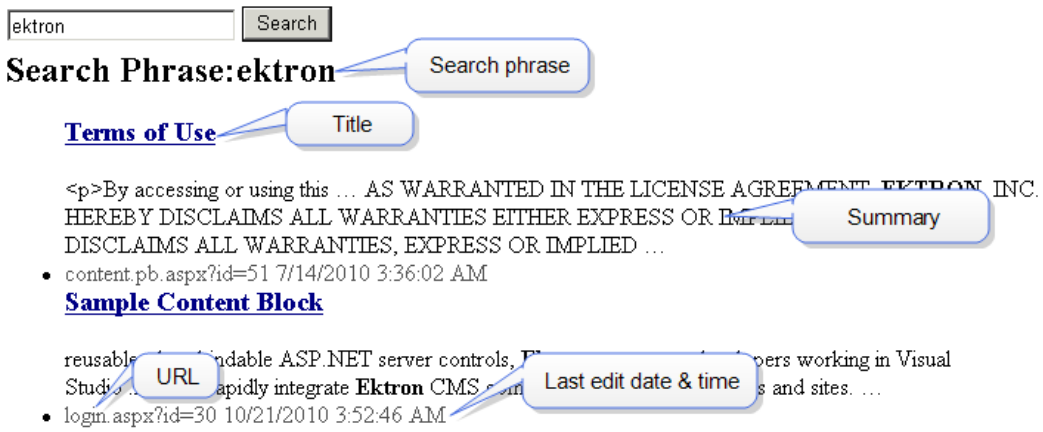
Unlike the other search controls, SiteSearchController has no UI functionality. So, there is no corresponding .ascx file.

SiteSearchResultsView



The SiteSearchResultsView control receives search results from the SiteSearchController and displays them on a page. See also: *Properties for SiteSearchResultsView* on page 2102.

By default, the control's display looks like this.



NOTE: To manage the paging display at the bottom of the page, use an `EktronUI:Pagercontrol`.

To enable search functionality, connect a SiteSearchController to a SiteSearchResultsView control. Use the control's `controllerID` property to do this. For the `controllerID` property value, enter the ID of the SiteSearchController that takes input from SiteSearchInputView control and returns search results to this control. For example:

```
<ektron:SiteSearchResultsView ID="SiteSearchResultsView1"
    ControllerID="SiteSearchController1" runat="server">
</ektron:SiteSearchResultsView>
```

To customize the SiteSearchResultsView control, first add a set of `<ItemTemplate>` tags between the SiteSearchResultsView control's opening and closing tags (as explained in *Templated server controls* on page 2045). Then, modify the search results in the following ways.

NOTE: As an alternative, you can copy the line that inserts a text box from *siteroot*\Workarea\FrameworkUI\Templates\Search\SiteSearchResultsView.ascx.

Displaying the search phrase with results

Use `<%# Eval("QueryText") %>` to databind the search term to the SiteSearchResultsView control. This code sample below displays an example of this **Search Phrase:** followed by the search term.

```
<ektron:SiteSearchResultsView ID="SiteSearchInputView1"
  ControllerID="SiteSearchController1" runat="server">
  <ItemTemplate>
       <p>Search Phrase:<%# Eval("QueryText") %> </p>
  </ItemTemplate>
</ektron:SiteSearchResultsView>
```

Displaying search results using a ListView control

Use a ListView control to display search results from a SiteSearchController.

1. Within a ListView control, use an `<%# Eval("Results") %>` statement to databind search results to the ListView control.

   ```
   <asp:ListView ID="aspResults" runat="server"
     DataSource='<%# Eval("Results") %>'
     ItemPlaceholderID="aspPlaceholder">
   ```

2. To define the main (root) layout of a ListView control, insert a LayoutTemplate. Within that template, insert a placeholder to store the server controls on the page.

   ```
   <asp:ListView ID="aspResults" runat="server"
     DataSource='<%# Eval("Results") %>'
     ItemPlaceholderID="aspPlaceholder">
   <layouttemplate>
     <ul class="results">
       <asp:PlaceHolder ID="aspPlaceholder" runat="server">
       </asp:PlaceHolder>
     </ul>
   </layouttemplate>
   ```

3. Use an ItemTemplate to specify the markup used to generate each record bound to the ListView. Here is an example that displays search results' title, summary, URL and date.

```
<itemtemplate>
  <li>
    <h3><a href="<%# Eval("Url") %>"><%# Eval("Title") %></a></h3>
    <p><%# Eval("Summary") %></p>
    <p><%# Eval("Url") %> <%# Eval("Date") %></p>
  </li>
</itemtemplate>
```

Here is the entire sample.

```
<itemtemplate>
  <asp:ListView ID="aspResults" runat="server"
    DataSource='<%# Eval("Results") %>'
    ItemPlaceholderID="aspPlaceholder">
    <layouttemplate>
       <ul class="results">
         <asp:PlaceHolder ID="aspPlaceholder" runat="server">
         </asp:PlaceHolder></ul>
    </layouttemplate>
    <itemtemplate>
      <li>
         <h3><a href="<%# Eval("Url") %>"><%# Eval("Title") %></a></h3>
         <p><%# Eval("Summary") %></p>
         <p><%# Eval("Url") %> <%# Eval("Date") %></p>
      </li>
    </itemtemplate>
  </asp:ListView>
</itemTemplate>
```

Displaying search results using a GridView control

You can use an `asp:Gridview` control to make search results look like the following.

Search results for: cms

Title	Url	Summary	Date
Controles para Servidor de Ektron CMS400.NET	http://smacdonald1/CMS400Developer/dynamic.aspx?id=30	<ddd/> robust, Ektron <c0>CMS</c0>-powered Web sites and Web applications more rapidly than with other content mana <ddd/> de los datos del <c0>CMS</c0>, expuestos con los controles del servidor va co'digo-behinds. <ddd/> contentos, el <c0>CMS</c0> de Ektron provee de un "ambiente virtual del desarrollo," en contacto en tiempo r <ddd/>	3/24/2006 12:14:05 PM

To modify the UI for SearchResultsView:

1. Within the `<ektron:SearchResultsView>` tags, insert `<ItemTemplate></ItemTemplate>`.
2. Between the `<ItemTemplate>` tags, insert the following code, shown in bold.

```
<ektron:SearchResultsView ControllerID="SiteSearchController1"
  runat="server">
  <ItemTemplate>
```

```
    <h2>Search results for: <%# Eval("QueryText") %></h2>
    <asp:Gridview ID="Gridview1" DataSource='<%# Eval("Results") %>'
      runat="server">
    </asp:Gridview>
  </ItemTemplate>
</ektron:SearchResultsView>
```

3. Modify the appearance of the results using Gridview properties and styles. See also: GridView Class.

Inserting SiteSearch templated server controls

To provide search capabilities to your website content, insert all 3 components of the SiteSearch templated server control onto an .aspx template. Because the search functions are managed by separate controls, you can place a search field and button in a one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only 10 results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

PREREQUISITE

Search server controls were added to the Visual Studio Toolbox. See *Adding search server controls to Visual Studio* on page 2083.

If you drag and drop controls from the Visual Studio Toolbox, the necessary `register` statements are copied from the `web.config` file and added to the page.

```
<add tagPrefix="ektron" namespace="Ektron.Cms.Framework.UI.Controls"
  assembly="Ektron.Cms.Framework.UI.Controls, Version=8.5.0.356,
  Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
<add tagPrefix="ektronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  assembly="Ektron.Cms.Framework.UI.Controls.EktronUI,
  Version=8.5.0.356, Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
```

If you copy and paste the sample code, add the following `register` statement for templated controls:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls"
  tagprefix="ektron" %>
```

For Ektron UI controls, use this `register` statement:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>
```

The tag prefix can be anything as long as it matches the control's prefix.

The following template shows the 3 components of the SiteSearch templated server control.

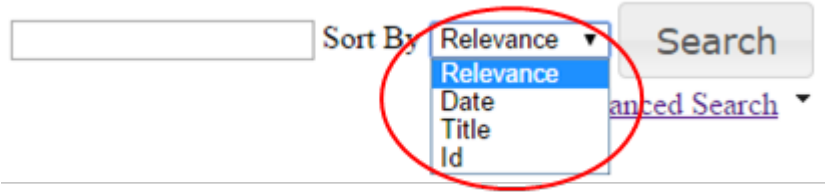
```
<%@ Page Language="C#" AutoEventWireup="true"
  CodeFile="TemplatedControl.aspx.cs"
  Inherits="TemplatedControl" ValidateRequest="false" %>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
      "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
```

```
  <head runat="server">
    <title></title>
  </head>
  <body>
    <form id="form1" runat="server">
      <div>
        <ektron:SiteSearchInputView ID="SiteSearchInputView1"
          ControllerID="SiteSearchController1" runat="server">
        </ektron:SiteSearchInputView>
        <ektron:SiteSearchController ID="SiteSearchController1"
          runat="server" />
        <ektron:SiteSearchResultsView ControllerID="SiteSearchController1"
          ID="SiteSearchResultsView1" runat="server">
        </ektron:SiteSearchResultsView>
        <ektronUI:Pager ID="pager1" runat="server"
          PageableControlID="SiteSearchController1"
          ResultsPerPage="10"></ektronUI:Pager>
      </div>
    </form>
  </body>
</html>
```

You can use the properties with `Eval` statements to display aspects of content search results. For example, `<%# Eval("Summary") %>` displays the summary for content being returned by the search.

Properties for SiteSearchInputView

- `ControllerID`. The *ID* of the SiteSearchController that provides the data.
- `ExactPhrase`. Sets an EXACT ORDER relationship among search terms.
- `Fields`. Label, Name, Xpath: Retrieve information from XML Smart Forms. See also:*XmlSearch* on page 2116.
- `QueryText`. The string that the site visitor entered to begin search.
- `SortProperties`. Provides a dropdown list that lets a site visitor sort search results by a list of pre-selected search properties.



The `Name` of the `SearchProperty` (by which you intend to sort search results) must exactly match the search property name in the search index. Sample code:

```
<cc1:SiteSearchInputView ID="SiteSearchInputView1" runat="server"
ControllerID="SiteSearchController1">
<SortProperties>
       <cc1:RankSearchProperty DisplayName="Relevance" />
       <cc1:DateSearchProperty Direction="Descending" Name="ebddatemodified"
DisplayName="Date" />
       <cc1:StringSearchProperty Direction="Descending" Name="exact_title"
DisplayName="Title" />
```

```
      <cc1:IntegerSearchProperty Direction="Ascending" Name="ebicontentid"
DisplayName="Id" />
</SortProperties>
</cc1:SiteSearchInputView>
```

- `WithAllWords`. Sets an AND relationship among search terms.
- `WithAnyWord`. Sets an OR relationship among search terms.
- `WithoutWords`. Sets a NOT relationship among search terms.

Properties for SiteSearchController

- `AdvancedQueryText`. See *Customizing the search behavior with AdvancedQueryText* on page 2083.
- `AutoCompleteMaxCount`. (Solr) the maximum number of results returned.
- `AutoSuggestMaxCount`. (Search Server, FAST) the maximum number of entries in the auto-suggest list.
- `EnableAutoComplete`. (Solr) suggests terms based on the user's input. For example, of you enter `ba`, autocomplete returns **backup**, **banner**, **base**, **basic**, and so on.
- `EnableAutoSuggest`. (Search Server, FAST) suggests similar terms or common refinements that searchers have used in the past which are related to the search term. As a user enters text, possible matches appear.
- `EnableQueryStatistics`. Enable logging of query statistics in Sharepoint based on the clicks on a search result, which are used to build auto-suggestions for a term.
- `ID` (Required). Provides the association for the SiteSearchInputView and SiteSearchResultsView server controls. The following example shows the ID property with the SiteSearchController.

```
<ektron:SiteSearchController ID="SiteSearchController1"
  runat="server" />
```

Properties for SiteSearchResultsView

- `ControllerID`. The *ID* of the SiteSearchController that provides the data.
- `ElapsedTime`. The time required to execute a search.
- `PageInfo`. Display information about search result numbers, such as **Displaying results 11 through 20 of 35**.
  - CurrentPageIndex. Current page.
  - EndCount. Number of results found.
  - NumberOfPages. Number of results divided by results per page.
  - PageCount. Number of the page being viewed currently.
  - ResultCount. Number of the results returned for the search terms.

    IMPORTANT: The result count is only an estimate. The count becomes more accurate you get closer to the final page.

  - ResultsPerPage. Number of results displayed per page.
  - StartCount. 1.

- `Results`. These are fields returned of type SearchResultsData. Display these inside a ListView or Repeater.
  - Date. Last edit date.
  - Summary. Content summary, up to a maximum of 400 characters.
  - Title
  - Url
  - Type: Content, forms, managed assets, and so on.
    For a full list, enter `SiteSearchResultType` into the Object Browser.
- `QueryText`. String that the site visitor entered to begin search.
- `SearchType`. 1 of the following:
  - Advanced
  - Basic
  - None. No search yet.
  - XmlSearch
- `State`. 1 of the following:
  - initialized. Search has not been run yet.
  - no results. No search results were returned.
  - search results. Search results were returned.
- `Suggested Results`. These fields returned of type SearchResultsData for Suggested Results. Display inside a ListView or Repeater. See also: Displaying Suggested Results.
  - Summary. Content summary, a maximum of 400 characters.
  - Title
  - Url
- `Suggested Spellings`. Displays a list of words that are similar to the entered search phrase. For a sample of using this, open *siteroot*`\workarea\FrameworkUI\Templates\Search\SiteSearchResultsView.ascx` and find `Eval("SuggestedSpellings")`.

Events for SiteSearch

None.

Methods for SiteSearch

- `Search(string queryText, string advancedQueryText)`
  - Description: Basic search
    - `queryText`. The text you have in the INPUT text box.
    - `advancedQueryText`. The extra query text that is appended to the end of the `queryText`, which you do not want to show on the INPUT text box.
  - Return Type: None
- `Search(string withAllWords, string withoutWords, string withAnyWord, string exactPhrase, string advancedQueryText)`

- Description: Advanced search
  - includes `withAllWords`, `withoutWords`, `withAnyWord` and `exactPhrase`.
  - `advancedQueryText`. The extra query text that is appended to the end of the queryText, which you do not want to show on the INPUT text box.
- Return Type: None

Theming for SiteSearch

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxSiteSearchInput"
  class="ektron-ui-control
  ektron-ui-search
  ektron-ui-search-site">
  <div class=basicSearch>
  <span class="ektron-ui-control ektron-ui-input ektron-ui-textField"
    id="uxSiteSearchInput_ctl00_0_uxSearchText_0_TextField_0_
      uxTextField_0">
  <input type="text"
    id="uxSiteSearchInput_ctl00_0_uxSearchText_0_TextField_0_aspInput_0"
    name="uxSiteSearchInput$ctl00$ctl00$uxSearchText$TextField$aspInput">
  </span>
  <span class="ektron-ui-button">
    <input type="button" autocomplete="off" value="Search" title=""
      onclick="WebForm_DoPostBackWithOptions(new WebForm_PostBackOptions
      ('uxSiteSearchInput$ctl00$ctl00$uxBasicSearchButton', '', true,
        '', '', false, true));"
      name="uxSiteSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
      id="uxSiteSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
      class="ui-button ui-widget ui-state-default ui-corner-all"
      role="button">
  </span>
  <script type="text/javascript"
    id="uxSiteSearchInput_ctl00_0_uxBasicSearchButton_0_uxSiteSearchInput_
      ctl00_0_uxBasicSearchButton_0EktronScriptBlockdmvjp_0">

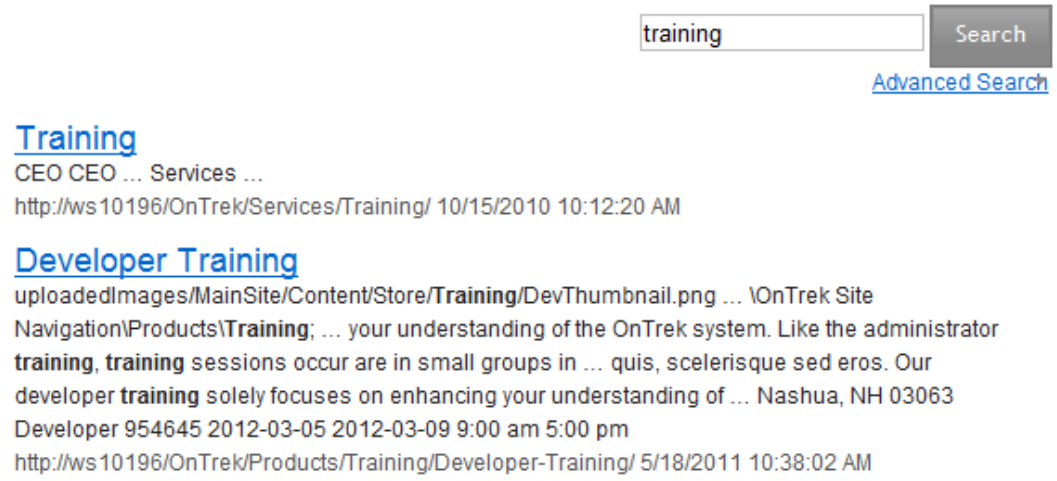
Properties

None.

Search results

The following example shows just 2 of the many results of searching for "training" in the demo field.



Example for SiteSearch

.aspx

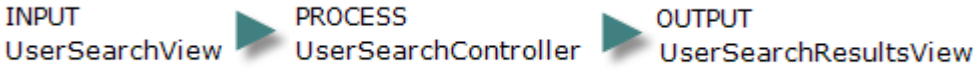
```
<ektron:SiteSearchInputView ID="uxSiteSearchInput"
  ControllerID="uxSearchController" runat="server">
</ektron:SiteSearchInputView>
<ektron:SiteSearchResultsView ID="uxSiteSearchResults"
  ControllerID="uxSearchController" runat="server">
</ektron:SiteSearchResultsView>
<ektron:SiteSearchController ID="uxSearchController" runat="server">
</ektron:SiteSearchController>
```

UserSearch

8.50 and higher

```
<TSC:UserSearch>
```

The UserSearch templated server control lets site visitors search for users and membership users of your website. UserSearch consists of the following components:



- `UserSearchInputView`. Accepts user input of search terms.
- `UserSearchController`. Takes input from `UserSearchInputView` control and returns search results.
- `UserSearchResultsView`. Shows search results; you can modify the results' display, paging and so on.

To provide search capabilities for your Web site content, insert all three controls onto an `.aspx` template. Because the search functions are managed by separate controls, you can place a search field and button in one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only ten results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

Input and output markup

`InputView` and `ResultsView` controls have a corresponding `.ascx` template that contains default markup. You can modify a template to change a control's default markup. You can find the search control template files at the following locations:

```
[site root]\workarea\FrameworkUI\Templates\Search\UserSearchInputView.ascx
[site root]\workarea\FrameworkUI\Templates\Search\UserSearchResultsView.ascx
```

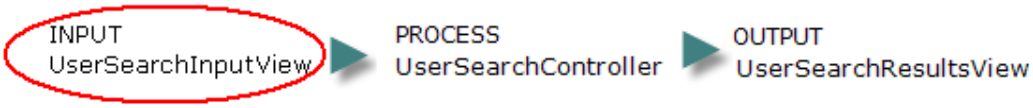
Process controller

The `Controller` control takes input from an `InputView` control, and returns search results to a `ResultsView` control. It provides an interface to the search API, giving search view controls access to search data. The `Controller` control executes a search using a query string from search `InputView` control's `Text` property, as specified in the code-behind's `OnClick` event. You may modify the `Controller` or write your own.

Unlike the other search controls, the `Controller` control has no UI functionality.

Use only one `Controller` control per page.

UserSearchInputView



The UserSearchInputView server control lets site visitors search for Ektron users and members. See also: *Properties for UserSearchInputView* on page 2111, and Membership Users and Groups, and Managing Users and User Groups.

Site visitors can find users using any of these properties:

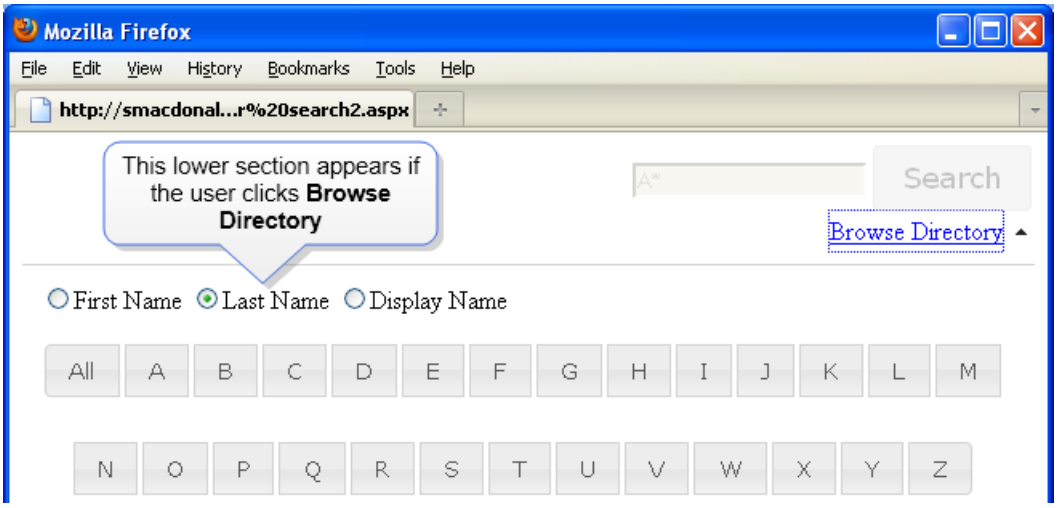
- first name
- last name
- username
- email address

- display name
- tag

Site visitors can use the wildcard character (*) to find all users that fit a certain pattern. For example, to find all users with any property that begins with **adm**, enter **adm***.

To customize the UserSearchInputView control, use the same process as *Customizing the SiteSearchInputView control* on page 2095.

The following image shows the default template's search options.



A site visitor's query string is collected by the UserSearchInputView server control and passed to *ProductSearch* on page 2085 which, in turn, sends results to the *UserSearchResultsView* on the facing page.

You can place the UserSearchInputView server control anywhere on a page. It does not need to be next to its results control. Also, you can place more than one UserSearchInputView control on a page.

UserSearchController

The UserSearchController server control takes input from a UserSearchInputView control, and returns results to a UserSearchResultsView control. It provides an interface to the search API, thereby giving SearchView controls access to search data. See also:*Properties for UserSearchInputView* on page 2111.

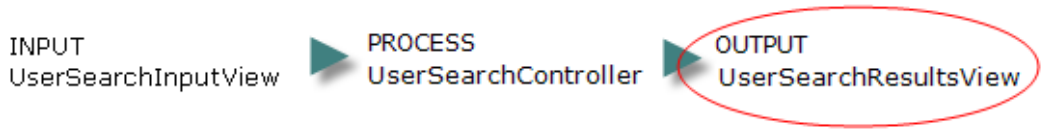
You can modify Ektron's UserSearchController or write your own.

The UserSearchController executes a search using a query string from the UserSearchInputView control's `Text` property, as specified in the code-behind's `Onclick` event.

Unlike the other search controls, UserSearchController has no UI functionality. So, there is no corresponding .ascx file.

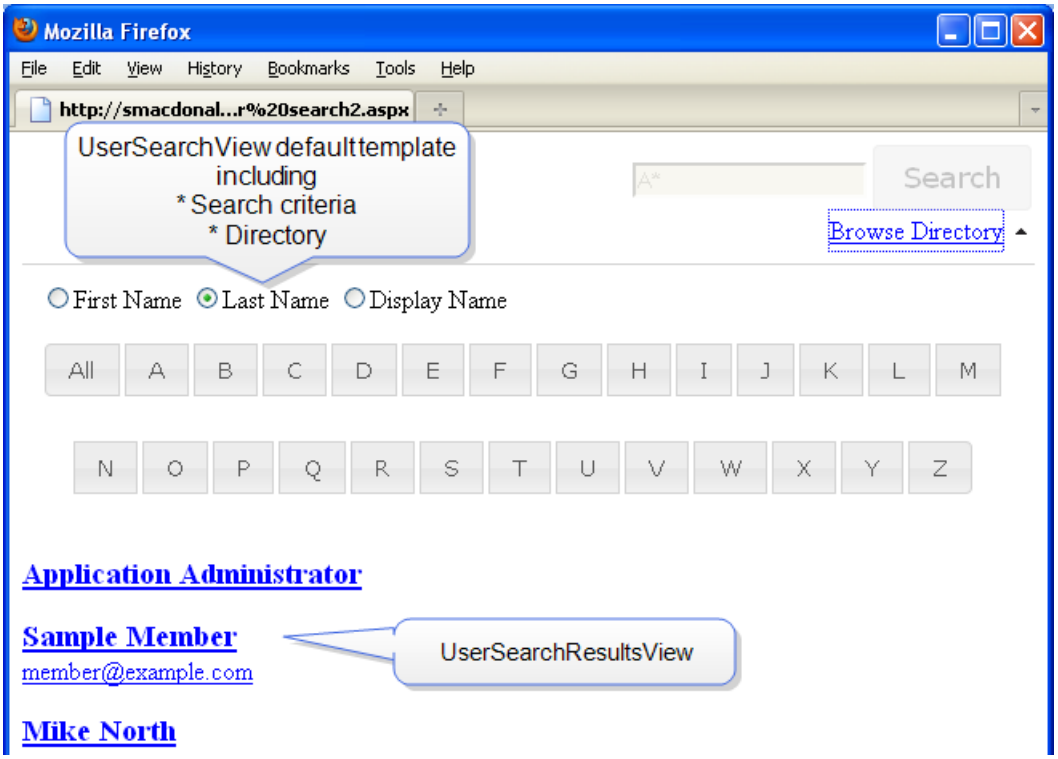
Use only one UserSearchController per page.

UserSearchResultsView



The UserSearchResultsView server control displays the results of a user and member search. The control gets its results from *ProductSearch* on page 2085. See also:*Properties for UserSearchInputView* on page 2111.

The following image shows the UserSearchInputView control's filters, and search results that use the UserSearchResultsView control's default template. To see an example of displaying user search results, see *siteroot*\workarea\FrameworkUI\Templates\Search\UserSearchResultsView.ascx.



To enable the display of user search results, use the UserSearchResultsView control's `controllerID` property to connect it to a SearchController.

For the `ControllerID` property value, enter the `ID` of the UserSearchController that takes input from UserSearchInputView control and returns results to this control. For example:

```
<CMS:UserSearchResultsView ID="UserSearchView1"
  ControllerID="UserSearchController1" runat="server">
</CMS:UserSearchResultsView>
<CMS:UserSearchController ID="UserSearchController1" runat="server" />
```

Inserting UserSearch templated server controls

To provide search capabilities to your website content, insert all 3 components of the UserSearch templated server control onto an .aspx template. Because the search functions are managed by separate controls, you can place a search field and button in a one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only 10 results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

> Search server controls were added to the Visual Studio Toolbox. See *Adding search server controls to Visual Studio* on page 2083.

If you drag and drop controls from the Visual Studio Toolbox, the necessary `register` statements are copied from the `web.config` file and added to the page.

```
<add tagPrefix="ektron" namespace="Ektron.Cms.Framework.UI.Controls"
  assembly="Ektron.Cms.Framework.UI.Controls, Version=8.5.0.356,
  Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
<add tagPrefix="ektronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  assembly="Ektron.Cms.Framework.UI.Controls.EktronUI,
  Version=8.5.0.356, Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
```

If you copy and paste the sample code, add the following `register` statement for templated controls:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls"
  tagprefix="ektron" %>
```

For Ektron UI controls, use this `register` statement:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>
```

The tag prefix can be anything as long as it matches the control's prefix.

The following template shows the 3 components of the UserSearch templated server control.

```
<%@ Page Language="C#" AutoEventWireup="true"
  CodeFile="TemplatedControl.aspx.cs"
  Inherits="TemplatedControl" ValidateRequest="false" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls" tagprefix="ektron" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>

<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
      "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
  <head runat="server">
    <title></title>
  </head>
  <body>
```

```
    <form id="form1" runat="server">
      <div>
        <ektron:UserSearchInputView ID="UserSearchInputView1"
          ControllerID="SearchController1" runat="server">
        </ektron:UserSearchInputView>

        <ektron:UserSearchController ID="SearchController1"
          runat="server" />

        <ektron:UserSearchResultsView ControllerID="SearchController1"
          ID="UserSearchResultsView1" runat="server">
        </ektron:UserSearchResultsView>

        <ektronUI:Pager ID="pager1" runat="server"
          PageableControlID="SiteSearchController1"
          ResultsPerPage="10">
        </ektronUI:Pager>
      </div>
    </form>
  </body>
</html>
```

Properties for UserSearchInputView

- `ControllerID`. ID of the SearchController that provides the data.

  ```
  <ektron:Serena ID="UserSearchInputView1"
    ControllerID="SearchController1" runat="server">
  </ektron:UserSearchInputView>
  ```

- `QueryText`. String that the site visitor entered to begin search.
- `SearchType`. Basic or Advanced search (site visitor clicks **Browse Directory** to access advanced search).

Properties for UserSearchController

- `ID` (Required). Provides the association for the SiteSearchInputView and SiteSearchResultsView server controls. Here is an example of the ID property with the SiteSearchController.

  ```
  <ektron:SiteSearchController ID="SiteSearchController1"
    runat="server" />
  ```

- `AdvancedQueryText` (Optional). See *Customizing the search behavior with AdvancedQueryText* on page 2083.

Properties for UserSearchResultView

- `AvailableFilters`. Label, Name, Value.
- `ControllerID`. The *ID* of the SiteSearchController that provides the data.
- `DirectorySearchLetter`. The letter the site visitor clicks to initiate the search after clicking **Browse Directory**.
- `DirectorySearchType`. First name, last name, or display name.
- `PageInfo`. Display information about search result numbers, such as **Displaying results 11 through 20 of 35**.
  - `CurrentPageIndex`. Current page.
  - `EndCount`. Number of results found.

  - `NumberOfPages`. Number of results divided by results per page.
  - `PageCount`. Number of the page being viewed currently.
  - `ResultCount`. Number of the results returned for the search terms.

    IMPORTANT: The result count is only an estimate. The count becomes more accurate you get closer to the final page.

  - `ResultsPerPage`. Number of results displayed per page.
  - `StartCount`. 1.
- `QueryText`. The string that the site visitor entered to begin search.
- `Results`. Fields returned of UserSearchResults. Display these inside a ListView or Repeater, for example.
  - Avatar
  - DisplayName
  - email
  - FirstName
  - LastName
  - ProfileURL
  - Tags
- `State`. 1 of the following:
  - initialized. Search has not been run yet.
  - no results. No search results were returned.
  - search results. Search results were returned.

Events for UserSearch

None.

Methods for UserSearch

- `AdvancedSearch(List<UserPropertyFilter> filters)`
  - `filters`. Label, Name and Value UserPropertyFilter
- `BasicSearch(string queryText, string advancedQueryText)`
  - `queryText`. The text you have in the INPUT text box.
  - `advancedQueryText`. The extra query text that is appended to the end of the `queryText`, which you do not want to show on the INPUT text box.
- `DirectorySearch(DirectorySearchType type, string advancedQueryText)`
  - type of DirectorySearchType. FirstName, LastName or DisplayName.
  - `advancedQueryText`. The extra query text that is appended to the end of the `queryText`, which you do not want to show on the INPUT text box.
  - Return Type: None.
- `DirectorySearch(DirectorySearchType type, char firstLetter, string advancedQueryText)`

- type of DirectorySearchType. FirstName, LastName or DisplayName.
- `firstLetter`. The first letter of the DirectorySearchType for which you are searching.
- `advancedQueryText`. The extra query text that is appended to the end of the `queryText`, which you do not want to show on the INPUT text box.
- Return Type: None.

- `UpdateFilters(List<UserPropertyFilter> filters)`
  - `filters`. Label, Name and Value UserPropertyFilter

Theming for UserSearch

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxUserSearchInput"
  class="ektron-ui-control ektron-ui-search ektron-ui-search-users">
  <div class="basicSearch">
    <span class="ektron-ui-control ektron-ui-input ektron-ui-textField"
      id="uxUserSearchInput_ctl00_0_uxSearchText_0_TextField_0_
        uxTextField_0">
      <input type="text"
        id="uxUserSearchInput_ctl00_0_uxSearchText_0_TextField_0_
          aspInput_0"
        value="admin"
        name="uxUserSearchInput$ctl00$ctl00$uxSearchText$
          TextField$aspInput">
    </span>
    <span class="ektron-ui-button">
      <input type="button" autocomplete="off" value="Search" title=""
        onclick="WebForm_DoPostBackWithOptions
          (new WebForm_PostBackOptions
          ('uxUserSearchInput$ctl00$ctl00$uxBasicSearchButton',
          '', true, '', '', false, true));"
        name="uxUserSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
        id="uxUserSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
        class="ui-button ui-widget ui-state-default ui-corner-all"
        role="button">
      </span>
      <script type="text/javascript"
        id="uxUserSearchInput_ctl00_0_uxBasicSearchButton_0_
          uxUserSearchInput_ctl00_0_uxBasicSearchButton_
          0EktronScriptBlockewyld_0">
        <!--//-->
        <![CDATA[//>
        <!--
          Ektron.ready(function(event, eventName)
```

```
        {
        $ektron
          ("#uxUserSearchInput_ctl00_0_uxBasicSearchButton_0_Button"
          ).button();
        });
      //-->
      <![]>
    </script>
  <div class="toggleDirectoryWrapper">

Example for UserSearch

.aspx

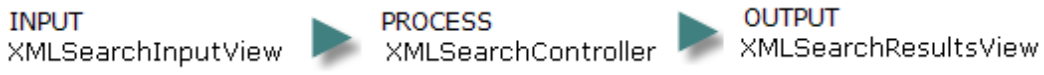
```
<ektron:UserSearchInputView ID="uxUserSearchInput"
 ControllerID="uxSearchController" runat="server">
</ektron:UserSearchInputView>
<ektron:UserSearchResultsView ID="uxUserSearchResults"
  ControllerID="uxSearchController" runat="server">
</ektron:UserSearchResultsView>
<ektron:UserSearchController ID="uxSearchController" runat="server">
</ektron:UserSearchController>
```

XmlSearch

8.50 and higher

```
<TSC:XmlSearch>
```

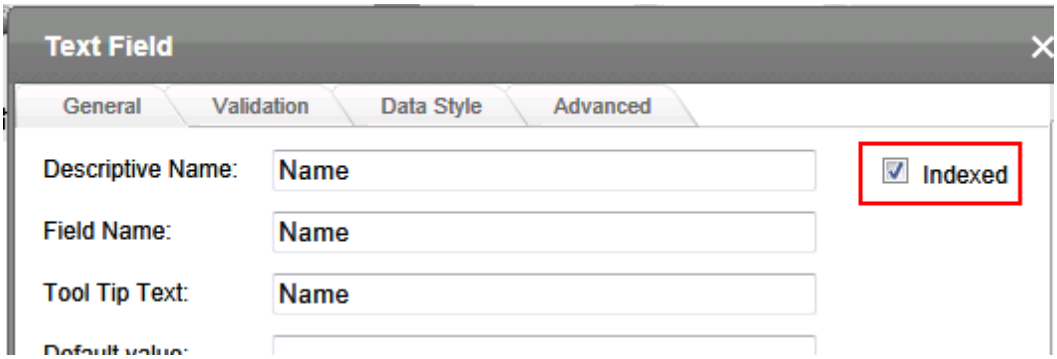
The XMLSearch templated server control displays a Smart Form's fields on a search page. A site visitor can use the fields to search for Smart Form content. XMLSearch consists of the following components:



- `XmlSearchInputView`. Accepts user input of search terms.
- `XmlSearchController`. Takes input from `XmlSearchInputView` control and returns search results.
- `XmlSearchResultsView`. Shows search results; you can modify the results' display, paging and so on.

IMPORTANT: Only fields marked **Indexed** appear on the form (see image below). Also, you cannot search a Smart Form field if its entire xpath exceeds 64 characters. See also: Specifying Which XML Elements are Indexed.

—Image—



To provide search capabilities for your Web site content, insert all three controls onto an .aspx template. Because the search functions are managed by separate controls, you can place a search field and button in one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only ten results), insert an <TSC:Pager> server control on the page to manage the paging of the search results.

Input and output markup

InputView and ResultsView controls have a corresponding .ascx template that contains default markup. You can modify a template to change a control's default markup. You can find the search control template files at the following locations:

```
[site root]\workarea\FrameworkUI\Templates\Search\XmlSearchInputView.ascx
[site root]\workarea\FrameworkUI\Templates\Search\XmlSearchResultsView.ascx
```

Process controller

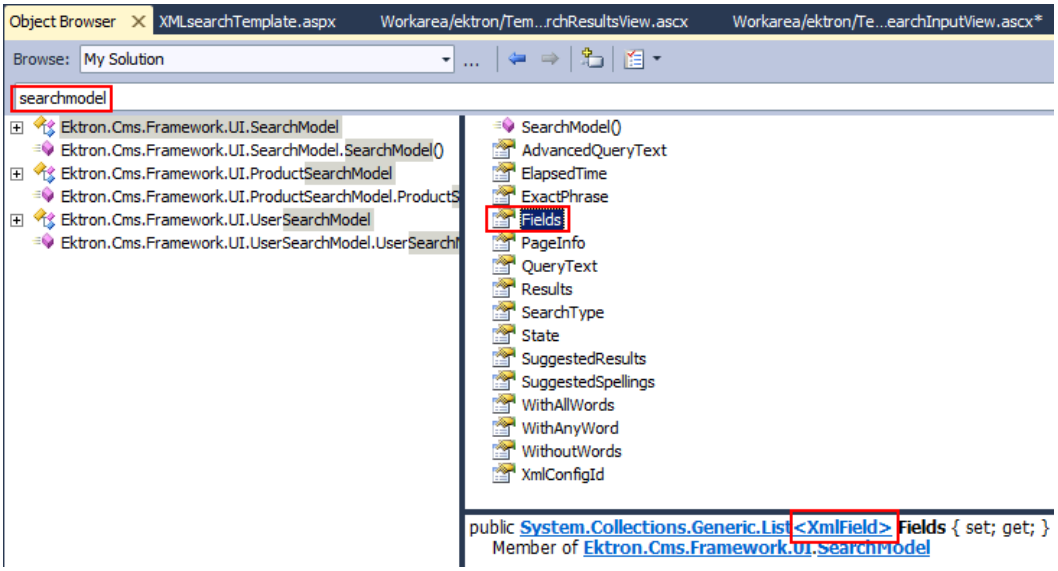
The Controller control takes input from an InputView control, and returns search results to a ResultsView control. It provides an interface to the search API, giving search view controls access to search data. The Controller control executes a search using a query string from search InputView control's Text property, as specified in the code-behind's OnClick event. You may modify the Controller or write your own.

Unlike the other search controls, the Controller control has no UI functionality.

Use only 1 Controller control per page.

Search model for XML Smart Forms

The Search Model gets bound to (that is, determines) the view. When viewing the Search Model in the object browser, you see a property named *Fields*, which is a list of each XML Smart Form field.



To view the Search Model for XML Smart Forms, insert **XMLField** into the Object Browser. The class consists of a...

- **Label**. Friendly name
- **Name**. Internal smart form name
- **Xpath**. Path to field in Smart Form

XML Smart Form search controls use these fields to retrieve and display Smart Form content.

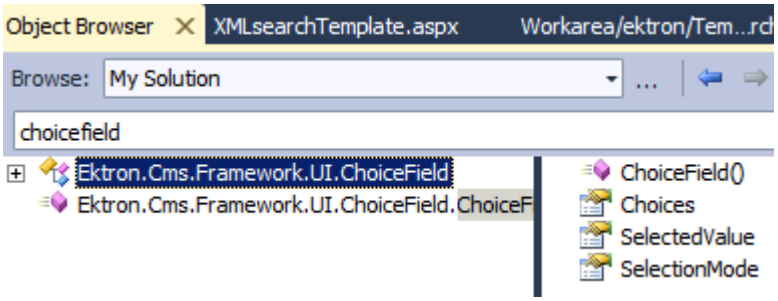
As explained in Using Data Field Types, there are many types of Smart Form fields. Each type has a subclass, which has a corresponding user control, an .ascx template file. User controls are located in `C:\Program Files (x86)\Ektron\CMS400v`*`version`*`\workarea\FrameworkUI\Templates\Search\Fields`. As explained in *Modifying the default markup* on page 2047, to change a control's default markup, modify its template.

IMPORTANT: Files stored in the *`siteroot`*`\Workarea` folder are overwritten (or deleted) when you upgrade. To avoid problems, back up the files to a folder outside the `siteroot\Workarea` folder.

Smart Form field controls receive an XML field and cast it into the specified field type. For example, the Object Browser shows that the ChoiceField template (`ChoiceField.ascx`) contains a

- List of possible choices
- Selected value. The current selection

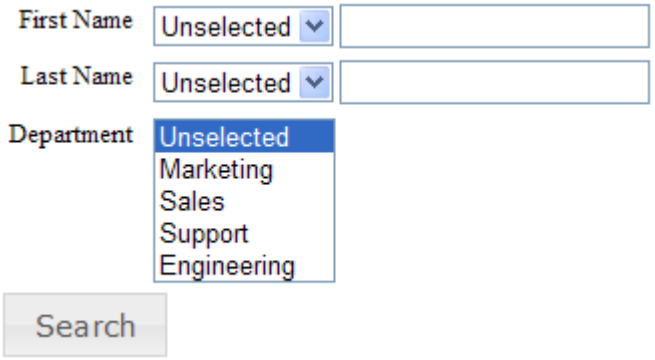
- Selection Mode. Select one or many



The ChoiceField template receives an XML field and casts it into a choice field.

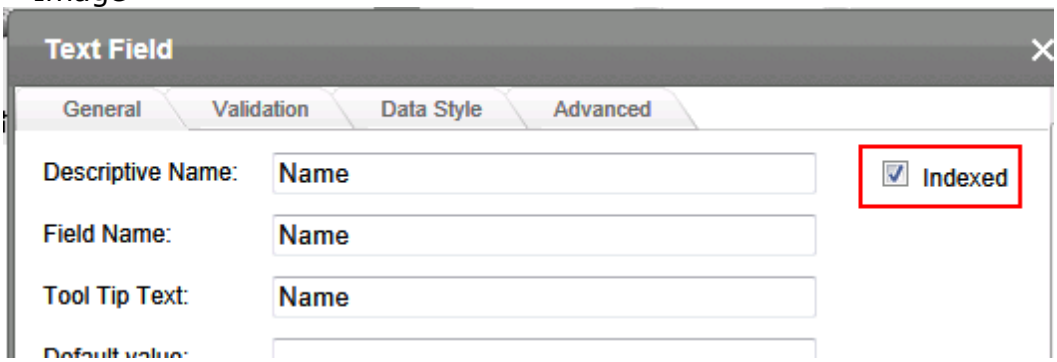
XMLSearchInputView

The XMLSearchInputView server control displays a Smart Form's fields and lets users search on them. See also: *Properties for XmlSearchInputView* on page 2121.



IMPORTANT: Only fields marked **Indexed** appear on the form (see image below). Also, you cannot search a Smart Form field if its entire xpath exceeds 64 characters. See also: Specifying Which XML Elements are Indexed.

—Image—



Because XML fields have a type (for example, string, date, choice, integer, boolean), the template is dynamic and connected to a Smart Form's data structure.

XMLSearchController

The XMLSearchController server control takes input from a XMLSearchInputView control, and returns results to a XMLSearchResultsView control. It provides an interface to the search API, thereby giving SearchView controls access to search data. See also: *Properties for XmlSearchController* on the facing page.

You can modify Ektron's XMLSearchController or write your own.

The XMLSearchController executes a search using a query string from the XMLSearchInputView control's `Text` property, as specified in the code-behind's `Onclick` event.

Unlike the other search controls, XMLSearchController has no UI functionality. So, there is no corresponding .ascx file.

Use only one XMLSearchController per page.

Inserting XmlSearch templated server controls

To provide search capabilities to your website content, insert all 3 components of the XmlSearch templated server control onto an .aspx template. Because the search functions are managed by separate controls, you can place a search field and button in a one section of a page, and the results in another.

Also, unless you want to use the default paging properties (which show only 10 results), insert an `<TSC:Pager>` control on the page to manage the paging of the search results.

> Search server controls were added to the Visual Studio Toolbox. See *Adding search server controls to Visual Studio* on page 2083.

If you drag and drop controls from the Visual Studio Toolbox, the necessary `register` statements are copied from the `web.config` file and added to the page.

```
<add tagPrefix="ektron" namespace="Ektron.Cms.Framework.UI.Controls"
  assembly="Ektron.Cms.Framework.UI.Controls, Version=8.5.0.356,
  Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
<add tagPrefix="ektronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  assembly="Ektron.Cms.Framework.UI.Controls.EktronUI,
  Version=8.5.0.356, Culture=neutral, PublicKeyToken=559a2c4fa21e63be" />
```

If you copy and paste the sample code, add the following `register` statement for templated controls:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls"
  tagprefix="ektron" %>
```

For Ektron UI controls, use this `register` statement:

```
<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>
```

The tag prefix can be anything as long as it matches the control's prefix.

The following template shows the 3 components of the XmlSearch templated server control.

```
<%@ Page Language="C#" AutoEventWireup="true"
  CodeFile="TemplatedControl.aspx.cs"
  Inherits="TemplatedControl" ValidateRequest="false" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls"
  namespace="Ektron.Cms.Framework.UI.Controls" tagprefix="ektron" %>

<%@ Register assembly="Ektron.Cms.Framework.UI.Controls.EktronUI"
  namespace="Ektron.Cms.Framework.UI.Controls.EktronUI"
  tagprefix="ektronUI" %>

        </ektron:XmlSearchResultsView>

        <ektronUI:Pager ID="pager1" runat="server"
          PageableControlID="XmlSearchController1" ResultsPerPage="10">
        </ektronUI:Pager>
      </div>
    </form>
  </body>
</html>
```

Attributes for XmlSearch

Properties for XmlSearchInputView

- `ControllerID`. The *ID* of the SiteSearchController that provides the data.
- `XmlConfigId`. Long Integer: If content is an XML Smart Form, the ID of its configuration. See also: Copying a Smart Form Configuration.

Properties for XmlSearchController

- `AdvancedQueryText` (Optional). See *Customizing the search behavior with AdvancedQueryText* on page 2083.
- `ID` (Required). Provides the association for the SiteSearchInputView and SiteSearchResultsView server controls. Here is an example of the ID property with the SiteSearchController.

```
<ektron:SiteSearchController ID="SiteSearchController1"
  runat="server" />
```

Properties for XmlSearchResultsView

- `ControllerID`. The *ID* of the XmlSearchController that provides the data.
- `ElapsedTime`. The time required to execute a search.
- `PageInfo`. Display information about search result numbers, such as **Displaying results 11 through 20 of 35**.
  - CurrentPageIndex. Current page.
  - EndCount. Number of results found.
  - NumberOfPages. Number of results divided by results per page.
  - PageCount. Number of the page being viewed currently.
  - ResultCount. Number of the results returned for the search terms.

    IMPORTANT: The result count is only an estimate. The count becomes more accurate you get closer to the final page.

  - ResultsPerPage. Number of results displayed per page.
  - StartCount. 1.
- `Results`. These are fields returned of type SearchResultsData. Display these inside a ListView or Repeater.
  - Date. Last edit date.
  - Summary. Content summary, up to a maximum of 400 characters.
  - Title
  - Url
  - Type: Content, forms, managed assets, and so on.
    For a full list, enter `SiteSearchResultType` into the Object Browser.
- `QueryText`. String that the site visitor entered to begin search.
- `SearchType`. 1 of the following:
  - Advanced
  - Basic
  - None. No search yet.
  - XmlSearch
- `State`. 1 of the following:
  - initialized. Search has not been run yet.
  - no results. No search results were returned.
  - search results. Search results were returned.

Events for XmlSearch

None.

Methods for XmlSearch

- `GetXmlFields(long xmlConfigId);`
  - `GetXmlFields` gets the XML search field list and update the View for the search form.
  - `XmlConfigId` is the Smart Form configuration ID.
  - Return Type: None.
- `XmlSearch(SearchModel model);`
  - Xml Search. `SearchModel` contains all the search results, search query, query filter and paging information of the search.
  - Return Type: None.

Theming for XmlSearch

Theming styles the appearance, including colors and background textures, using jQuery UI CSS Framework and Ektron UI CSS Framework. Use the ThemeRoller tool to create and download custom themes that are easy to build and maintain. If you want to customize it further, you can use control-specific classes referenced within the control's markup.

The classes in the following example are colored and bolded as follows:

- Ektron UI
- jQuery UI
- Control-specific class

```
<div id="uxXmlSearchInput"
  class="ektron-ui-control
  ektron-ui-search
  ektron-ui-search-xml">
  <div class="xml-search-fields">
    <table class="fields-list" id="fields">
      <tbody>
        <tr class="text-field">
          <td class="field-label">
            <label id="uxXmlSearchInput_ctl00_0_aspFields_0_uxField_2_
              ctl00_0_aspLabel_0"
              for="uxXmlSearchInput_ctl00_0_aspFields_0_uxField_2_ctl00_
                0_aspOperators_0">
                CustomerCompany
            </label>
          </td>
          <td>
            <select class="operators"
              id="uxXmlSearchInput_ctl00_0_aspFields_0_uxField_2_ctl00_
                0_aspOperators_0"
              name="uxXmlSearchInput$ctl00$ctl00$aspFields$ctrl2$uxField$
                ctl00$ctl00$aspOperators">
            <option value="Unselected">Unselected</option>
            <option value="Contains">Contains</option>
            <option value="Equals" selected="selected">Equals</option>
            </select>
            <span class="ektron-ui-input     value"
              id="uxXmlSearchInput_ctl00_0_aspFields_0_uxField_2_ctl00_0_
                uxInputText_0_TextField_0_uxTextField_0">
```

```
            <input type="text"
              id="uxXmlSearchInput_ctl00_0_aspFields_0_uxField_2_ctl00_0_
                uxInputText_0_TextField_0_aspInput_0"
              value="aveya"
              name="uxXmlSearchInput$ctl00$ctl00$aspFields$ctrl2$uxField$
                ctl00$ctl00$uxInputText$TextField$aspInput">
            </span>
          </td>
        </tr>
      </tbody>
    </table>
  </div>
  <span class="ektron-ui-button">
  <input type="button" autocomplete="off" value="Search" title=""
    onclick="if (!$ektron.groupValid('urn:Ektron.ValidationGroup.
      uxXmlSearchInput_ctl00_0'))
    {return false;};WebForm_DoPostBackWithOptions
      (new WebForm_PostBackOptions
      ('uxXmlSearchInput$ctl00$ctl00$uxXmlSearchButton', '', true,
      'urn:Ektron.ValidationGroup.uxXmlSearchInput_ctl00_0', '',
        false, true));"
     name="uxXmlSearchInput_ctl00_0_uxXmlSearchButton_0_Button"
     id="uxXmlSearchInput_ctl00_0_uxXmlSearchButton_0_Button"
     class="ui-button ui-widget ui-state-default ui-corner-all"
     role="button">
  </span>
  <script type="text/javascript"
    id="uxXmlSearchInput_ctl00_0_uxXmlSearchButton_0_uxXmlSearchInput_
      ctl00_0_uxXmlSearchButton_0EktronScriptBlockliswr_0">
    <!--//-->
    <![CDATA[//>
    <!--
      Ektron.ready(function(event, eventName)
      {
      $ektron("#uxXmlSearchInput_ctl00_0_uxXmlSearchButton_0_
        Button").button();
      });
    //-->
    <!]]>
  </script>
  <script type="text/javascript"
    id="uxXmlSearchInput_ctl00_0_uxScriptBlockSearch_0_uxXmlSearchInput_
      ctl00_0_uxScriptBlockSearch_0EktronScriptBlockkrmcq_0">
    <!--//-->
    <![CDATA[//>
    <!--
      Ektron.ready(function(event, eventName)
      {
      setTimeout("Ektron.Controls.Search.XmlSearch.init(
        { clientId: 'uxXmlSearchInput_ctl00_0' })", 0);
      });
    //-->

  </ul>
</div>
```

Example for XmlSearch

.aspx

```
<ektron:XmlSearchInputView ID="uxXmlSearchInput" runat="server"
  ControllerID="uxSearchController" XmlConfigId="10" >
</ektron:XmlSearchInputView>
<ektron:XmlSearchResultsView ID="uxXmlSearchResults" runat="server"
  ControllerID="uxSearchController" >
</ektron:XmlSearchResultsView>
<ektron:XmlSearchController ID="uxSearchController" runat="server">
</ektron:XmlSearchController>
```

Creating your own XML search template

You have an understanding of the structure of XML field types, as explained in *Search model for XML Smart Forms* on page 2117.

1. Bind fields to a list view.

```
<ektron:XmlSearchInputView ID="xmlSearchView" runat="server"
  ControllerID="SearchController" XMLConfigId="10">
<ItemTemplate>
  <asp:ListView ID="fields" DataSource='<%# Eval("Fields") %>'
    runat="server">
```

NOTE: The DataSource is the field's array returned from the SearchModel.

2. Insert a set of `<ItemTemplate>` tags.

```
<ektron:XmlSearchInputView ID="xmlSearchView" runat="server"
  ControllerID="SearchController" XMLConfigId="10">
<ItemTemplate>
```

```
  <asp:ListView ID=”fields” DataSource=’<%# Eval(“Fields”) %>’
    runat=”server”> </ItemTemplate>
```

3. Get an XML field and display its corresponding template. Because it does not specify which type of XML Smart Form field is being retrieved, use an XMLSearchField control to determine that.

   The XMLSearchField control has a `Field` property, which maps the control to the correct template in the `\workarea\FrameworkUI\Templates\Search\Fields` folder. For example, a boolean Smart Form field is mapped to `booleanfield.ascx`.

```
<ektron:XmlSearchInputView ID=”xmlSearchView” runat=”server”
  ControllerID=”SearchController” XMLConfigId=”10”>
<ItemTemplate>
  <asp:ListView ID=”fields” DataSource=’<%# Eval(“Fields”) %>’
  runat=”server”>
</ItemTemplate>
<ItemTemplate>
  <ektron:XmlSearchField ID="uxField" runat="server" Field='<%#
    Container.DataItem %>'>
  </ektron:XmlSearchField>
</ItemTemplate>
```

   The XMLSearchField control lets you manage the display of XML Smart Form fields displayed in the ListView. So, you can modify the search input form with effects like the `<ItemSeparatorTemplate>`, which lets you place text, images, and so on, between each field.

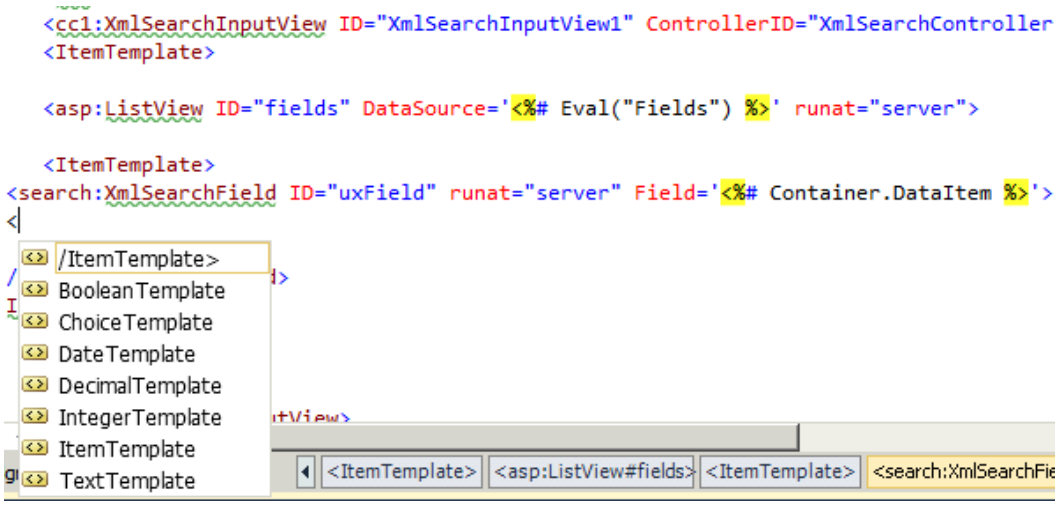
Customizing the rendering of a field

You can customize the behavior of an XML Smart Form field on the input form.

This is a complex procedure because, when a user clicks **Search**, your template must retrieve the modified fields, pass that data to the containing template which, in turn, passes the modified fields to the Search API. Use 2-way data binding to perform this procedure.

You followed the steps in *Creating your own XML search template* on the previous page.

1. Inside your XML Smart Form template, press **Enter** after `Field='<%# Container.DataItem %>'>`.
2. Insert a less than symbol (**<**). A drop-down list of Smart Form field types appears.



3. To replace the value of any field type, insert the corresponding Template field. For example, to replace a text element, click **TextTemplate** to insert a set of `<TextTemplate>` tags. Whatever you enter between the tags replaces the text template on the Smart Form input form.

   For example, to replace a text template field with a text box, use the following syntax.

```
<TextTemplate>
  <asp:TextBox ID="aspValue" Text='<%# Bind("Value") %>'
   runat="server" </asp:TextBox></TextTemplate>
```

Notice that this example uses `Bind`, which is a two-way statement. If the user changes the value in the text box, then posts back, the Bind command pushes the data into the template. The child template then takes the modified data from the template and pushes it back to the data object.

Server Controls

Developers use Microsoft Visual Studio to work with Ektron server controls.

A server control uses API language to interact with the CMS and Framework UI to display the output. You can drag and drop a server control onto an ASPX page to coexist with other components. This includes control for almost everything from content, to user management, breadcrumbs, and social network controls; to provide out-of-the-box markup and functionality. In addition to having a set of properties that you can use to change the controls' output and behavior, you can access the server control API.

Ektron's server controls let you insert many standard methods and properties within the Visual Studio environment. This means that you can see the effect of your changes in real time. You do not have to modify a page then compile a sample project to see the results.

You can insert server controls using drag and drop or programmatically. You can also use databinding to retrieve and display data from Ektron.

Additional information and examples for Ektron server controls are available online after you install the following sample site.

`http://localhost/samplesite/Default.aspx`

Replace *localhost* with the `webroot` where you installed the sample site.

IMPORTANT: For improved security,you should rename or remove the Web services file when you move it to your production server. After installation, this file is named `ServerControlWS.asmx` in the */siteroot/Workarea/* folder in your Web root.

`ServerControlWS.asmx` is the Web service that lets server controls communicate with Ektron. The path is coded in the `web.config` file as follows. Edit this line if you change the location or name of the `ServerControlWS.asmx` file.

```
<!-- Web Service URL for server controls design time -->
<add key="WSPath"
  value="http://localhost/siteroot/Workarea/ServerControlWS.asmx" />
```

The following list shows the Ektron server controls.

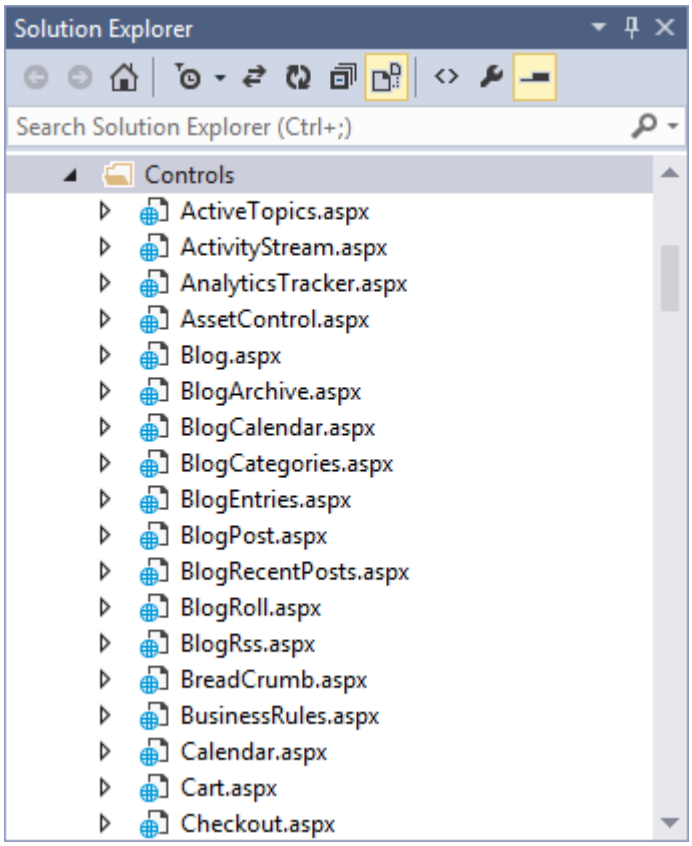
- *ActiveTopics* on page 2165
- *ActivityStream* on page 2219
- *AdaptiveMultiView* on page 1914
- *AnalyticsTracker* on page 2167
- *AssetControl* on page 2170
- *Blog server controls* on page 2173
  - *Blog* on page 2173
  - *BlogArchive* on page 2178
  - *BlogCalendar* on page 2180
  - *BlogCategories* on page 2182
  - *BlogEntries* on page 2184
  - *BlogPost* on page 2188

Opening a sample project in Visual Studio

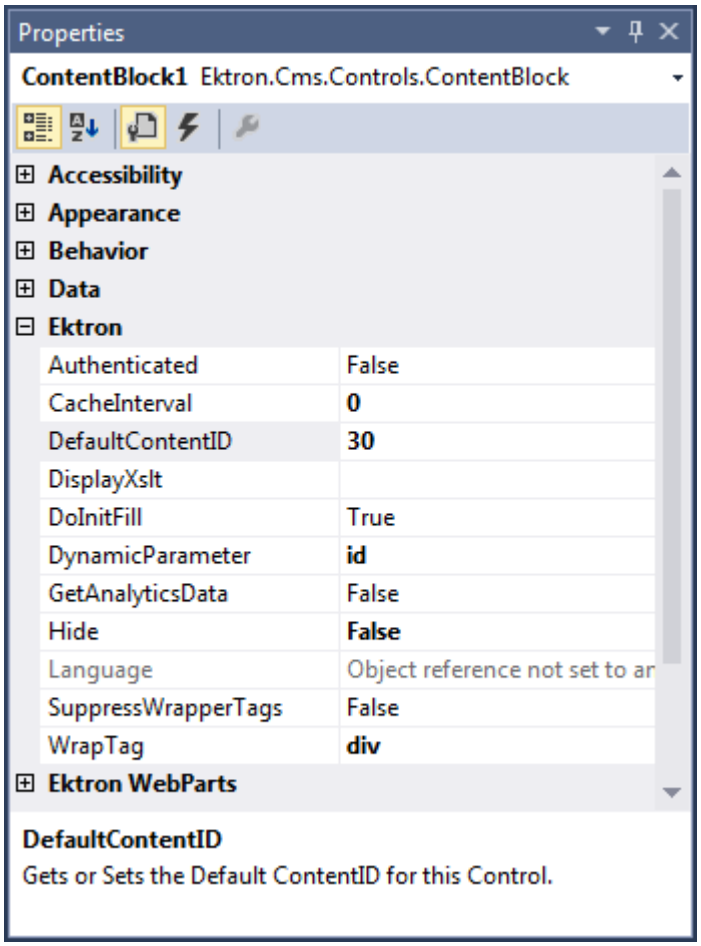
1. Using Visual Studio, choose **File > Open Project...** and browse to and double click Ektron's solution file, `localhost/siteroot/projectname.sln`. For example, for the OnTrek sample site, the file is `OnTrek.sln`. The sample site project opens.

   You can also open your website with **File > Open Web Site...**

2. To work on a template page, open the Solution Explorer and click the page you want.

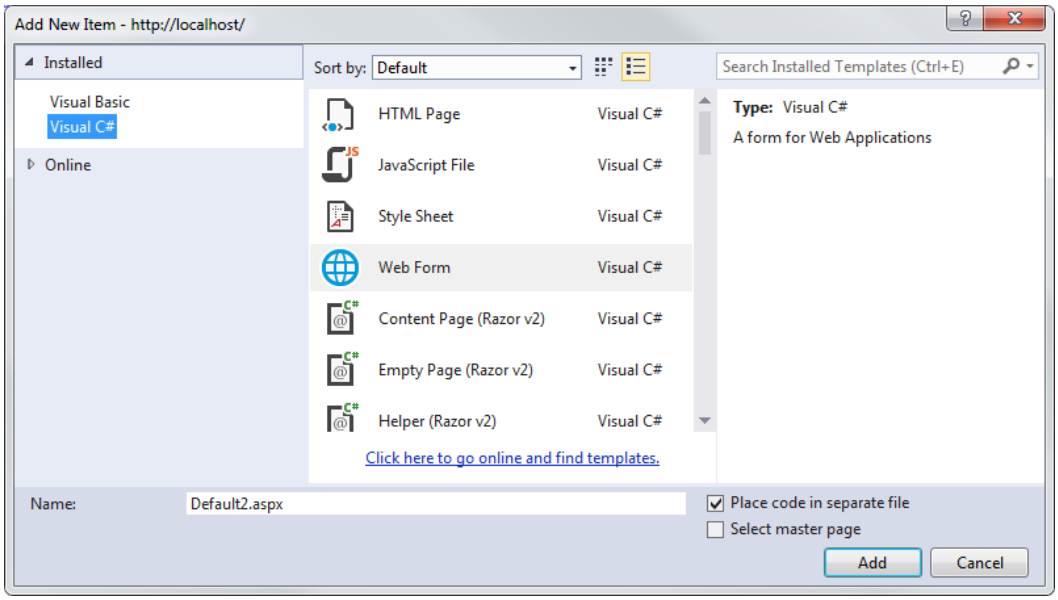


When you select a page, its properties appear in the Properties Window, and the page appears in the center of the screen. A control's properties include several standard .NET properties along with Ektron-specific ones.



Creating a template in Visual Studio

1. Choose **Website > Add New Item...**.
2. On the Add New Item screen, click **Web Form** and assign a name.



3. Add controls to determine the page content.

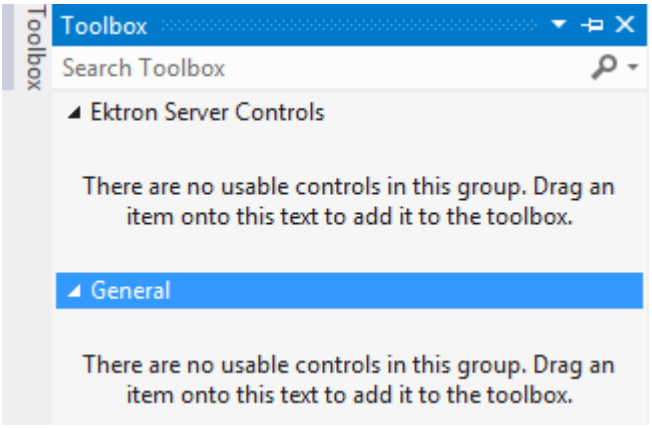
After you open the solution file in Visual Studio and add the required files, build the project. After the project is built, a browser opens and it appears as a Web page. You can also view a Web page while working on it by right clicking on the Web form and clicking **View in Browser**.

Installing server controls into Visual Studio Toolbox

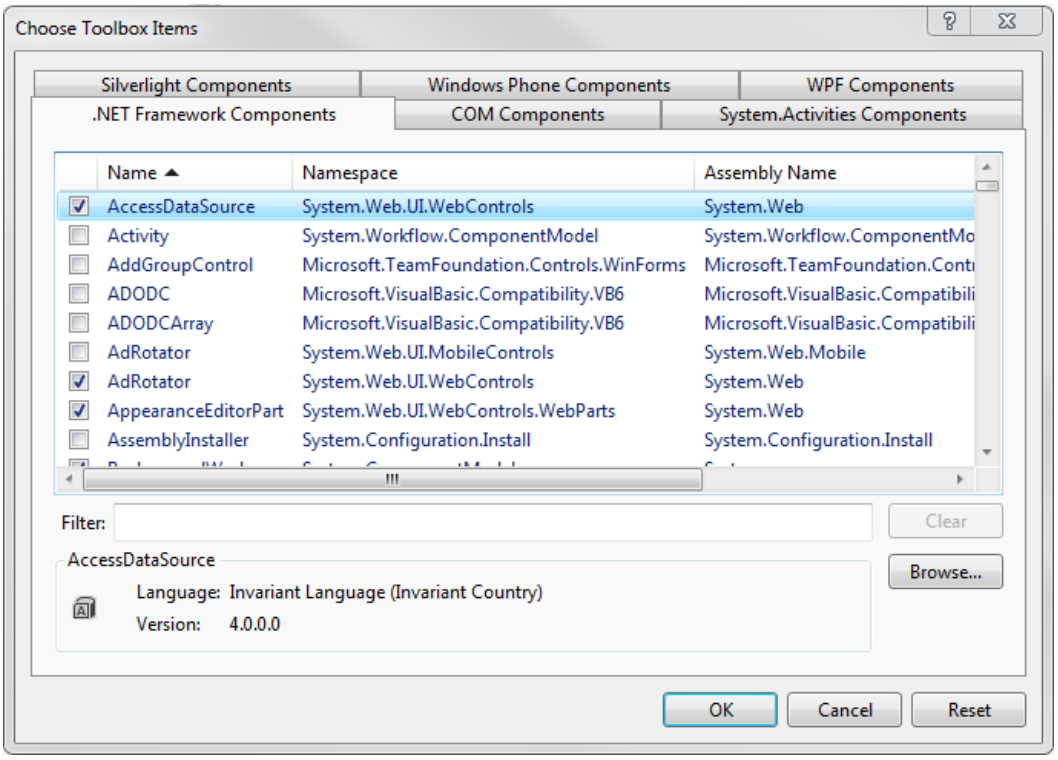
This section describes how to install server controls

NOTE: Search Server controls are installed separately. See *Adding search server controls to Visual Studio* on page 2083.

1. Copy the .dlls to a local drive before installing them. You cannot install them from a network drive.
2. Display the Visual Studio 2010 toolbox (**View > Toolbox**).
3. Right click the mouse within the Toolbox and click **Add Tab**.
4. Type **Ektron server controls** then press **Enter**.

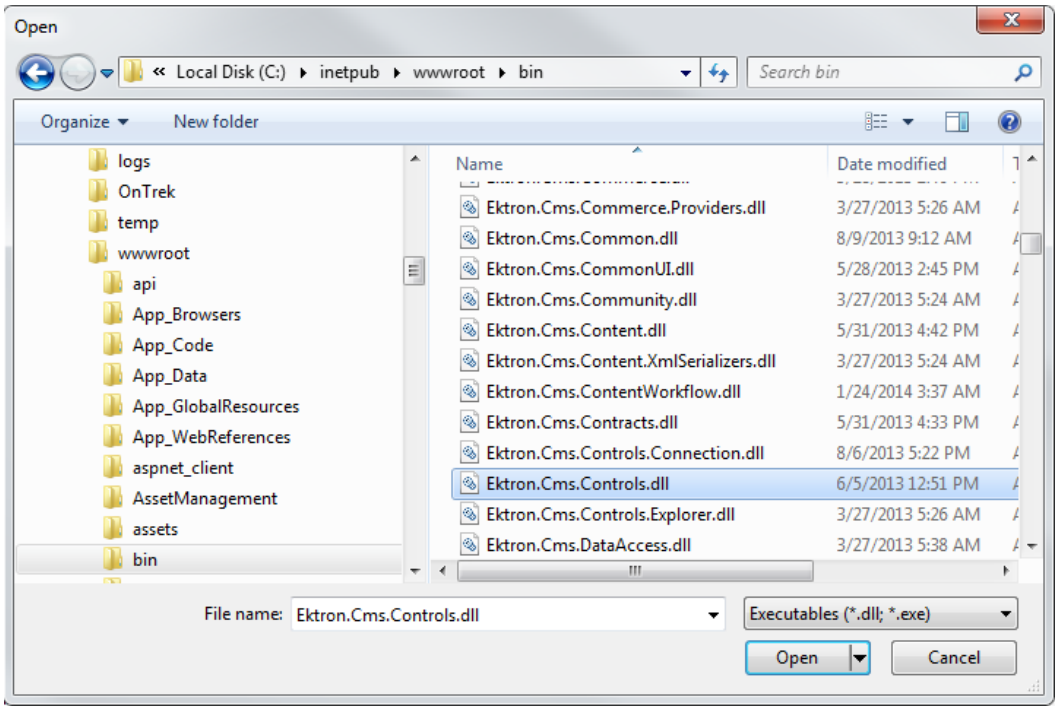


5. Click the Ektron server controls tab to open it.
6. Right click the mouse in the empty area and click **Choose Items**. The Customize Toolbox dialog appears.

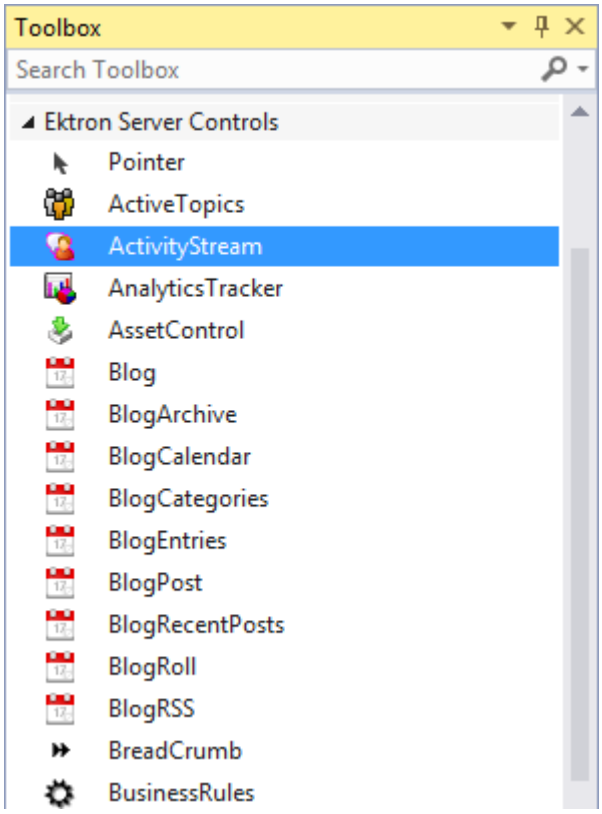


7. Click **Browse...** on the .NET Framework Components tab and find the directory that stores `Ektron`'s dll files (*`siteroot`*`/bin`).
8. Select *`siteroot`*`/bin/Ektron.Cms.Controls.dll` file and click **Open**. This file provides access to Ektron's server controls.

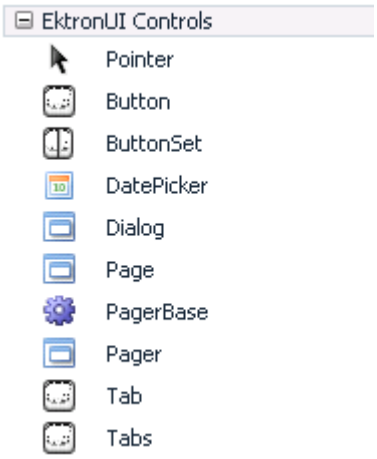
NOTE: Using the bin folder in your site provides better speed when loading Web pages. However, if you use the bin folder located in `C:\Program Files (x86)\CMS400vxx\bin`, you do not have to worry about deleting the .dll file if you change or delete your site. The file is identical in both places.



9. Click **OK** on the Choose Toolbox Items dialog box. The controls are added to the Ektron server controls tab of the Visual Studio Toolbox.



10. To install the UI server controls also, repeat steps 6 through 9 selecting *siteroot*/bin/**Ektron.Cms.Framework.UI.Controls.EktronUI.dll**. The controls appear on the Toolbox tab.



For easier viewing once the server controls are installed, you can right click on them and select **Sort Items Alphabetically**. You can only see the server controls when an ASPX template is selected.

Removing server controls from the Visual Studio Toolbox

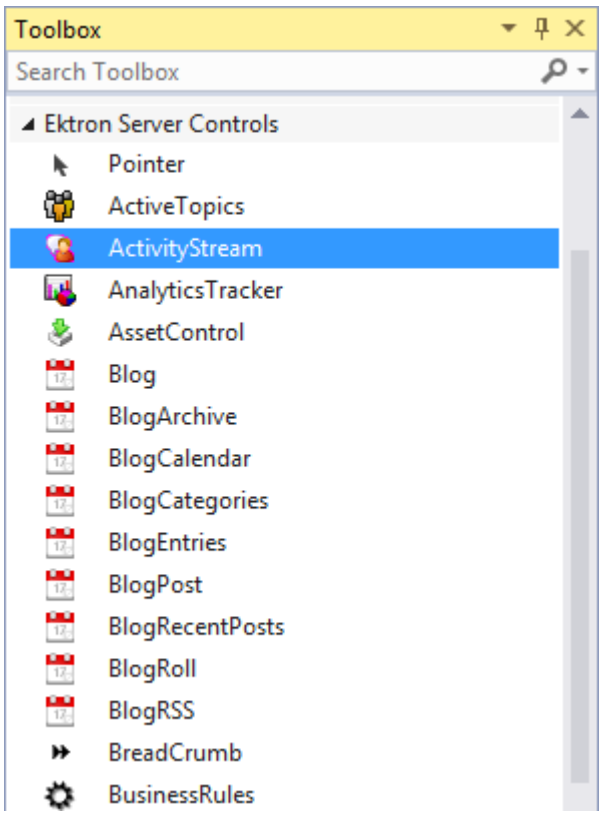
1. Display the Visual Studio toolbox (**View > Toolbox**).
2. Right click the mouse within the Toolbox.
3. Click **Choose Items...**.
4. Click **Namespace** or **Assembly Name** to sort the server controls by manufacturer.
5. Uncheck boxes next to the server controls you want to remove.
6. Click **OK**.

NOTE: If you want to delete all of the server controls from the **Ektron server control** tab, right click on the tab and choose **Delete Tab**.

Inserting a server control using drag and drop

Because Visual Studio is a visual environment, you can watch the page layout change as you add or move a control and adjust its properties. Use the CMS Explorer whenever you need to identify an Ektron object (such as content block or collection).

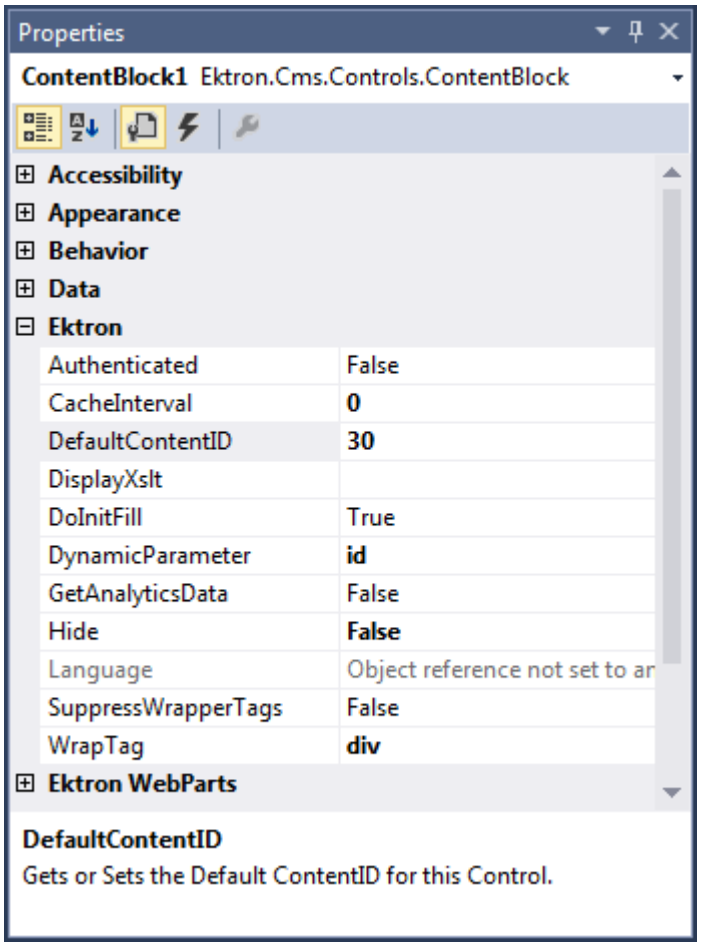
1. Display the Visual Studio toolbox (**View > Toolbox**).
2. Click the **Ektron server control** tab to display the server controls.



3. Drag a server control and drop it into the desired location on the page.

> **NOTE:** You also can place the cursor on the page where you want the server control, then double click the server control that you want.

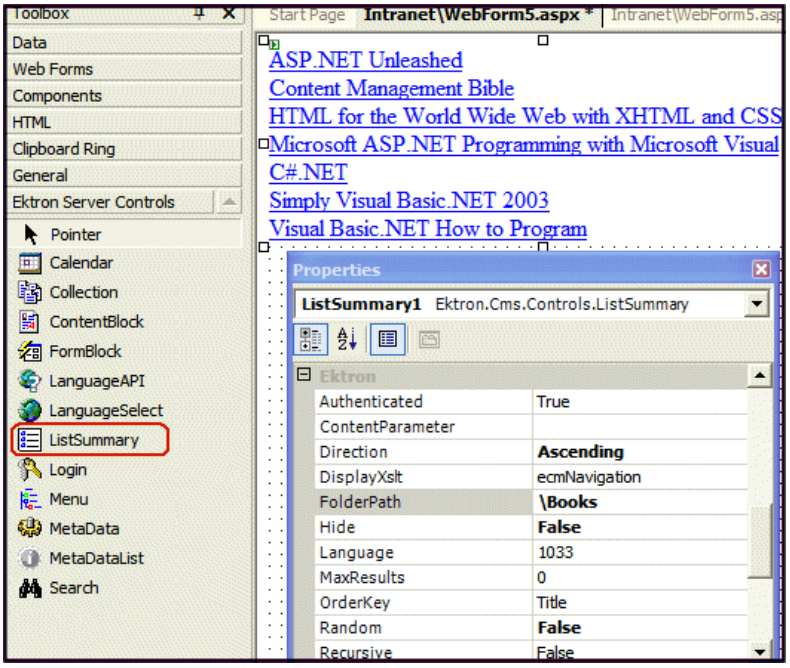
4. Modify the control's properties using the properties window of Visual Studio. The following images shows the ContentBlock properties.



Modifying a server control after drag and drop

You can manipulate a server control after dragging and dropping it on a Web form by using the code-behind. The following example shows using a drag and drop ListSummary server control then modifying it programmatically.

1. Drag and drop a ListSummary on your Web form and set your properties.



2. Add the following code to the code-behind.

```
Dim myString As String
Dim i
For i = LBound(ListSummary1.EkItems)To UBound(ListSummary1.EkItems)
  myString &= "<a href=""" & ListSummary1.EkItems(i).QuickLink & """>"
  & ListSummary1.EkItems(i).DateCreated & "</a><br>"
ListSummary1.Text = myString
Next
```

ListSummary1 is the ID of the object. It is used to get access to its properties.

3. Create a string that contains the output (myString).

```
Dim myString As String
```

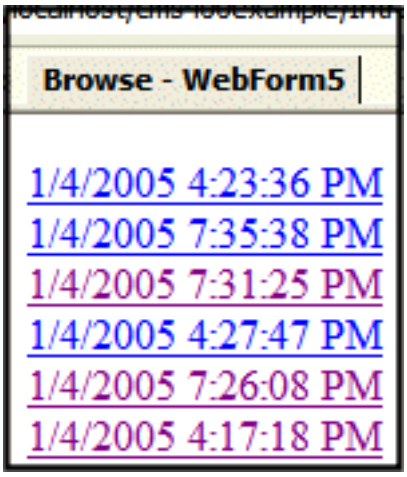
4. Set the object's `Text property to that string.`

```
myString &= "<a href=""" & ListSummary1.EkItems(i).QuickLink & """>"
  & ListSummary1.EkItems(i).DateCreated & "</a><br>"
```

5. Wrap it in a loop so it loops through each of the items.

```
Dim i
For i = LBound(ListSummary1.EkItems) To UBound(ListSummary1.EkItems)
Next
```

This example outputs the date created for each content block in a ListSummary.



Inserting a server control programmatically

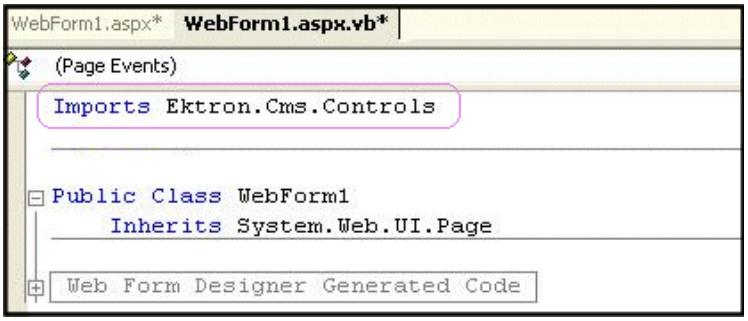
You may want to insert server controls programmatically for the following reasons:

- You want the control to be loaded into memory only under certain conditions. In this case, insert the logic that only displays the control if the condition exists.
- You want to display only certain properties of an object, such as the title of last edited date of a content block.

To insert an Ektron server control programmatically:

1. Declare the namespace at the top of the code-behind Visual Basic file.

   NOTE: You do not need to declare a namespace. However if you do not, you must fully qualify objects that you create. For any customization of Ektron, classes or controls that inherit from Ektron classes, you should create your own namespace within `Ektron.Cms.Custom`. For example, if your company is AcmeExampleTech, Inc. You should create all of your custom classes within the namespace `Ektron.Cms.Custom.AcmeExampleTech`.

2. Create an instance of the new control by declaring a control as an object in the code-behind; in this example, a collection named `MyColl`.

   ```
   Ektron.Cms.Controls.Collection MyColl =
     new Ektron.Cms.Controls.Collection();
   ```

   You can declare any server control as an object by using the server control name. Another example would be: `Dim MyMdl as New MetaDataList`.

3. Set the properties that you want to display on the page. For example:

```
Dim MyColl as New Collection
MyColl.DefaultCollectionID = 4
MyColl.Page = Page
```

With C#, use this syntax.

```
>
Ektron.Cms.Controls.Collection MyColl =
  new Ektron.Cms.Controls.Collection();
MyColl.DefaultCollectionID = 4;
MyColl.ID = "Collection1";
MyColl.Page = Page;
```

These lines tell the page to display CollectionID 1 unless otherwise specified.

IMPORTANT: When using code-behind to add a server control to your Web form, you must set the Page object for the server control to Page. For example, `Mycoll.Page = Page`
This line needs to appear between Dim new server control line and the Fill() line. This line is not added when dragging and dropping a server control on a Web form.

If you do not know an object's ID number, you can switch to Design mode, drag and drop the object, then use the CMS Explorer to find the ID number. If you do this, remember to delete the dropped object when you are done. You can also obtain the ID number via the Workarea. This line sets the `Random` property to **true**.

```
Dim MyColl as New Collection
MyColl.ID = "Collection1"
MyColl.DefaultCollectionID = 4
MyColl.Page = Page
MyColl.Random = True
```

4. Call the Fill method to fill an object's properties on the page because there is no render event when using objects as components not as controls.

```
>
Dim MyColl as New Collection
MyColl.ID = "Collection1"
MyColl.DefaultCollectionID = 4
MyColl.Page = Page
MyColl.Random = True
MyColl.Fill()
```

5. Use the property to determine what appears on the Web page. For example, to display the first item in a collection, use this syntax.

NOTE: Before adding this line you need to drag and drop a label on your Web form.

```
>
Dim MyColl as New Collection
MyColl.ID = "Collection1"
MyColl.DefaultCollectionID = 4
MyColl.Page = Page
MyColl.Random = True
MyColl.Fill()
Label1.Text = myColl.EkItems(0).Title
```

To display *all* items in a collection, use this syntax.

```
Dim myColl As New Ektron.Cms.Controls.Collection
Dim ekitem As New Ektron.Cms.Common.ContentBase
MyColl.DefaultCollectionID = 2
MyColl.ID = "Collection1"
MyColl.Page = Page
MyColl.Fill()
Label1.Text = "<ul>"
For Each ekitem In myColl.EkItems
Label1.Text &= "<li><a href=""" & ekitem.QuickLink & """>"
  & ekitem.Title & "</a>"
Next
Label1.Text &= "</ul>"
```

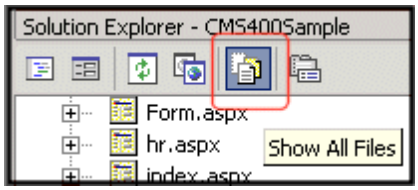
This example displays the quick link for every content block in the collection, formatted as a bulleted list. You can use similar code to display a List Summary or search results. The following explains the new (red) code above.

- `label1.Text = "<ul>"` displays the opening tag for the bulleted list
- `For Each ekitem In myColl.EkItems` creates a loop for all content blocks in the collection
- `label1.Text &= "<li><a href=" & ekitem.QuickLink & ">" & ekitem.Title & "</a></li>"` for each content block in the collection, displays its quicklink and title
- `Next` loops through all content blocks in the collection
- `label1.Text &= "</ul>"` closes the bulleted list

Customizing a server control

Visual Studio separates coding and logic from presentation. Web page formatting is handled by a page's HTML, while the logic is handled by the code-behind, which is stored in the corresponding .vb file. For example, if the ASP.NET page is `mypage.aspx`, the code-behind file is `mypage.aspx.vb`.

NOTE: If you do not see the code-behind files, click **Show All Files** on the Visual Studio Solution Explorer toolbar (circled in the following figure).



Within the Visual Basic file, you can use Visual Basic to insert code to manipulate the events that occur on the page.

This subsection contains the following topics:

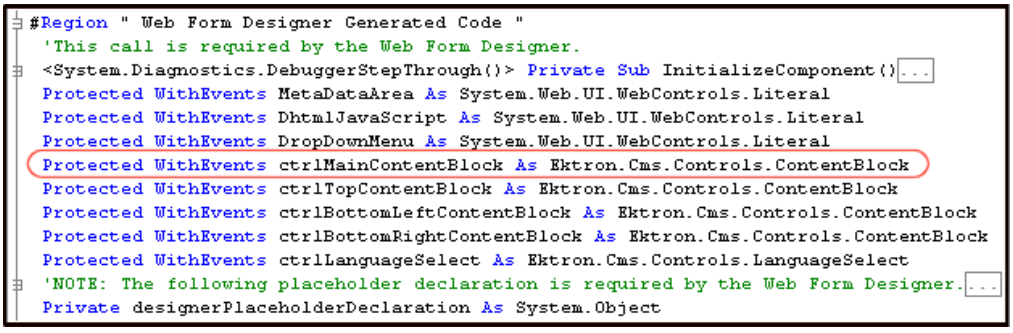
Viewing a server control in HTML

Within a Web page's HTML, a <cms> tag wraps the Visual Studio object. The following is an example of the Search and Contentblock server controls.

```
<cms:Search id="Search1" runat="server" ButtonText="Search"
  Display="Vertical">
</cms:Search>
<cms:ContentBlock
  id="ctrlMainContentBlock"
  runat="server"
  DefaultContentID="1"
  DynamicParameter="id"
  OverrideXslt="Default">
</cms:ContentBlock>
```

Viewing a server control in the code-behind

Within a Visual Studio code-behind file, the Ektron server controls appear (along with the Visual Studio controls) in the Web Form Designer Generated Code section. When you click **+** to display this section, you see something like the following. The content block listed in HTML (from the previous section) is circled to help you see their relationship.



The next section of the code-behind page loads the page into the browser.

```
Private Sub Page_Load(ByVal sender As System.Object, ByVal e As
  System.EventArgs) Handles MyBase.Load
```

You want your events to occur while the page is loading, so add the custom code following this line.

Customizing a server control in the code-behind

To customize an Ektron server control in the code-behind, insert code similar to the following *after* the Page_load command.

```
Dim MyObj As New Ektron.Cms.Controls.ContentBlock
```

This code declares a variable named `MyObj` and assigns to it the value of a content block. The content block is part of the Ektron.CMS.Controls content base, so it has access to the Ektron database.

After defining MyObj as a content block, you can access its properties. For example, to assign a defaultID of 24, insert the following.

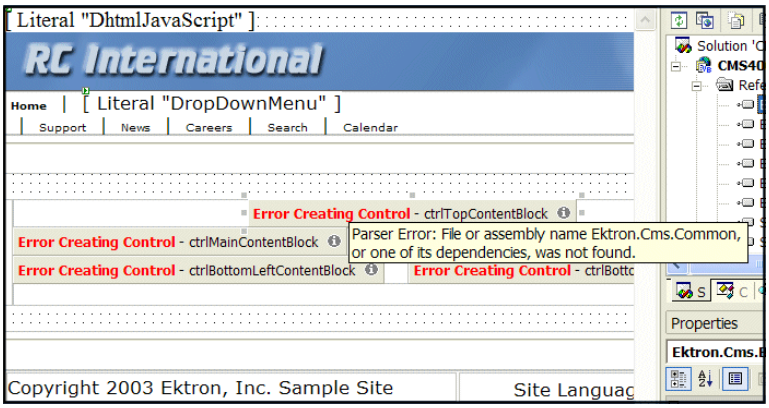
```
Dim MyObj As New Ektron.Cms.Controls.ContentBlock
MyObj.DefaultContentID = 24
```

The content block can be specified dynamically in the URL of the hyperlink that calls it. If not, content block 24 displays.

This is an example of programmatically applying property values to content blocks.

Troubleshooting error creating control message

If you get an Error Creating Control message while trying to use a server control, you can view the message by hovering the mouse over the control.



Using Ajax-enabled server controls and custom code

BEST PRACTICE

> When using Ajax server controls and custom code, wrap the custom code in a check for "is not a callback," so it is not executed when a callback from an Ajax server control occurs.

If you use an Ajax-enabled server control and write custom code, it may generate an exception, indicating the server control does not work. This issue happens during callback for the Ajax server control when custom code accesses a property that is filled during page load, but not filled during callback.

For example, a Poll server control is on a Web form, and you want the title of a content block to appear in a literal on that form. The `EkItem.Title` property for the content block is filled upon page load. When a site user answers a poll question, an exception occurs during the callback because the `EkItem.Title` property is not refilled. However, the site user does not see the exception because it looks like the Poll server control is not working.

The following example shows custom code that makes the content block's title appear in the literal:

```
Literal1.Text = ContentBlock1.EkItem.Title
```

To solve this issue, wrap the custom code in a check for "is not a callback". This prevents the code execution when callback occurs. For example:

```
[C#]
If( !IsCallback )
  {
    Literal1.Text = ContentBlock1.EkItem.Title
  }

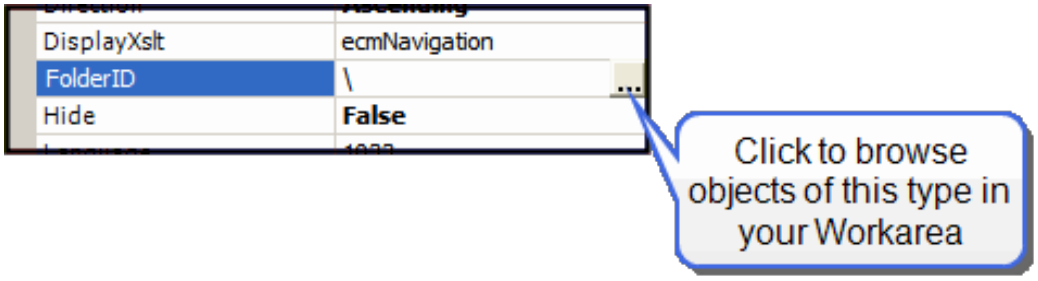
[VB]
If
  ( Not IsCallback )
  Literal1.Text = ContentBlock1.EkItem.Title
End If
```

Browsing your Ektron site using CMS Explorer

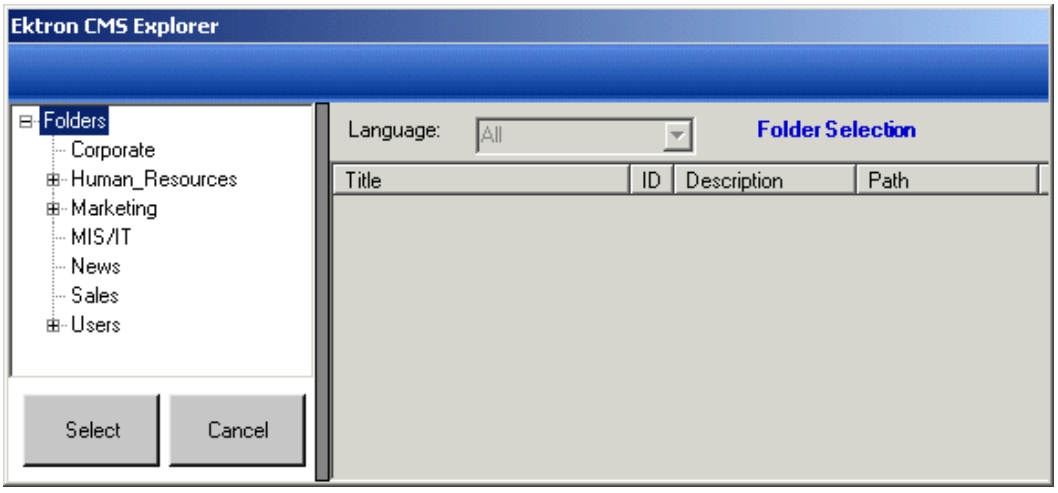
CMS Explorer lets you browse your website to identify Ektron objects such as folders, calendars, blogs, and content blocks. You access the CMS Explorer from the Properties window. For example, if you insert a *ListSummary* on page 2451 server control, its `FolderID` property identifies the folder whose contents are displayed.

1. If you are not sure of the folder path, click the ellipsis (**...**) button next to the property field. A login screen appears.

   NOTE: You cannot be logged into the CMS Explorer and the Workarea at the same time. If you log into the CMS Explorer while logged into the Workarea, an error message appears. If you log into the Workarea while logged into the CMS Explorer, you will need to re-login to the CMS Explorer when you return to using it.



2. Enter your Ektron username and password. The CMS Explorer window appears so you can browse your Ektron website.



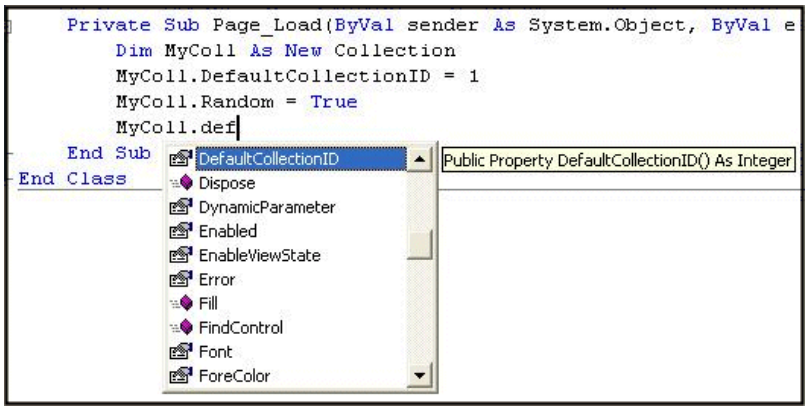
3. Navigate through the folders, select an object, then click **Select**. The selected object is pasted to the server control property.

NOTE: Although you see the object in the selected language in Visual Studio, the language is not stored. For example, if you select a German content block whose ID=2, Ektron only stores `content block ID=2`. When a visitor to your site browses to that page, the content block does not appear in the selected language. Instead, it is determined by a cookie or the user's language selection.

Accessing server control properties in code-behind programmatically

Every server control has properties associated with it that you can access only programmatically. This section explains what they are, how to access them, and how to use them.

You can use Visual Studio's IntelliSense feature to display a control's properties. The IntelliSense box appears as soon as you insert the period (.) after the object, as illustrated below.



The IntelliSense box displays *all* properties that can be applied.

The property's tooltip text indicates its type. In the previous example, note that the `DefaultCollectionID`'s type is integer.

To learn about native Visual Studio properties, see the Visual Studio documentation. For more information about accessing Ektron object properties, see *Customizing a server control in the code-behind* on page 2145.

Personalizing a page with user names and IDs

Every server control has the following read-only properties in the code-behind that let you personalize any page with user names and IDs, and show if they are logged in.

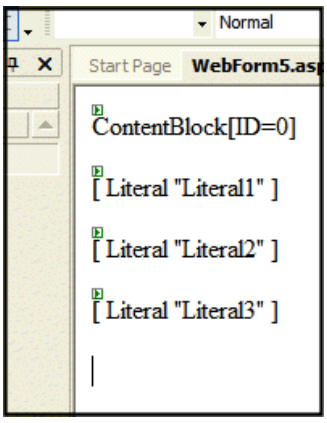
NOTE: The properties do not display values within Visual Studio during design time. Instead, they only display values at run time, which are dependent on the user's login status.

- **IsLoggedIn** (Boolean)
  Tells if a user is logged in to Ektron.
  - **True**. User is logged in
  - **False**. User is not logged in
- **LoggedInUserName** (String)
  Gets the Ektron user name to display.
- **LoggedInUserID** (Integer)
  Gets the Ektron ID of the user to display.

The following example shows these properties in code-behind.

NOTE: You must be logged in to Ektron for this example to show your name and ID.

1. Drag an Ektron server control onto a Web form.
2. Drag 3 Literals onto the Web form.

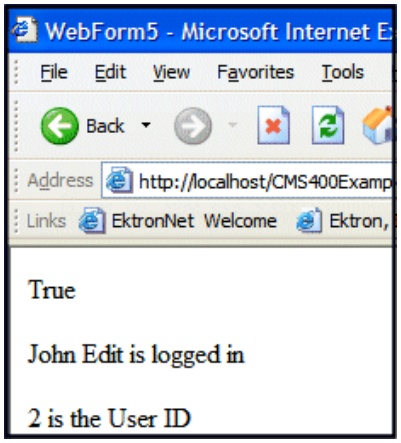


3. Open the code-behind for the Web form.
4. Add the following code to the Page_Load event.

```
Literal1.Text = ContentBlock1.IsLoggedIn
If ContentBlock1.IsLoggedIn Then
```

```
  Literal2.Text = ContentBlock1.loggedInUserName
  & " is logged in " Literal3.Text = ContentBlock1.loggedInUserID
  & " is the User ID "
End If
```

5. Build and run the solution.
6. Browse to the login page and log in.
7. Browse to the new Web form you added. The login information appears.

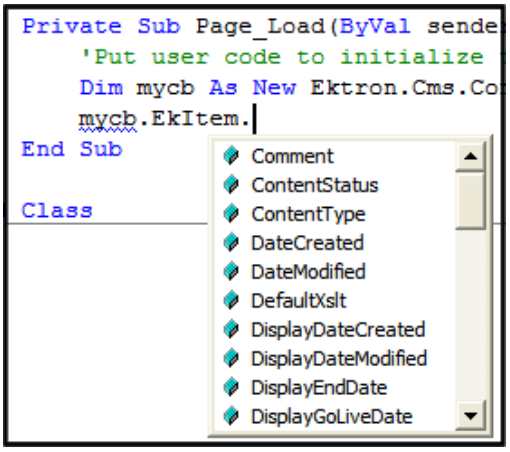


Accessing additional properties

Ektron provides access to additional properties for the following objects.

- ListSummary
- collection
- Search
- ContentBlock
- FormBlock

You can use IntelliSense to select from a list of additional object properties.



To access additional properties, use the standard property's syntax but add `.ekitem` or `.ekitems` after the object.

- *EkItem* is a single `Ektron.Cms.Common.ContentBase`
- *EkItems* is an array of `Ektron.Cms.Common.ContentBase`

```
dim MyCB as New ContentBlock
MyCB.DefaultContentID = 30
MyCB.ID = "ContentBlock1"
MyCB.Page = Page
MyCB.Fill()
label1.text = MyCB.EkItem.dateCreated
```

or

```
dim MyCB as new Ektron.Cms.Controls.ContentBlock
MyCB.DefaultContentID = 30
MyCB.ID = "ContentBlock1"
MyCB.Page = Page
MyCB.Fill()
label1.text = MyCB.EkItem.dateCreated
```

IMPORTANT: To access additional properties for the Collection, ListSummary, and Search objects, use ekitems, not ekitem. For example: `MyColl.ekitems(0).dateCreated`. where (0) is the index of the array. See also: *Accessing items in an array* on page 2153.

The additional properties are as follows.

NOTE: The following properties are read-only. For example, you can get a content block's ID and pass it to another part of the code. However, you cannot set a content block ID to be shown.
For example, `mycb.Ekitem.id = 8` does not set a content block's ID. To set a content block's ID, use `DefaultContentID = 8`.

- **Comment**. The content block's comment.
- **ContentStatus**. The status of the content block.
  - approved
  - checked out
  - checked in
  - expired
  - pending deletion
  - pending expiration
  - pending start date
  - submitted
- **ContentType**. One of the following:
  - all types
  - archived content
  - archived forms
  - content
  - forms
- **DateCreated**. The date when the content block was created, formatted as a .NET date type.

- **DateModified**. The date when the content block was modified, formatted as a .NET date type.
- **DefaultXslt**. The default XSLT used to display the content.
- **DisplayDateCreated**. The date when the content block was created. It is formatted as a string that represents Ektron's display of the date.
- **DisplayDateModified**. The date when the content block was edited. It is formatted as a string that represents Ektron's display of the date.
- **DisplayEndDate**. The content block's end date. It is formatted as a string that represents Ektron's display of the date.
- **DisplayGoLiveDate**. The content block's start date. It is formatted as a string that represents Ektron's display of the date.
- **DisplayStartDate**. The content block's start date. It is formatted as a string that represents Ektron's display of the date.
- **EndDate**. The content block's end date, formatted as a .NET date type.
- **EndDateAction**. One of the following:
  - archive display
  - archive expire
  - refresh report
- **FolderID**. The ID of the folder that contains each content block.
- **GoLiveDate**. The content block's start date formatted as a .NET date type.
- **Html**. The content that makes up the content block. If content block is in XML it will return it as raw XML content.
- **Hyperlink**. Content block title wrapped by `<a href>` tags.
- **Id**. The content block 's ID number.
- **InheritedFrom**. If folder permissions are inherited, the folder from which they are inherited.
- **IsInherited**. Whether a content block's permissions are inherited.
- **IsPrivate**. Whether or not a content block is private.
- **Language**. The content block's language.
- **LastEditorFname**. The first name of the last person to edit the content block.
- **LastEditorLname**. The last name of the last person to edit the content block.
- **PackageDisplayXSLT**. If the content block is XML, the name of its XSLT.
- **QuickLink**. The content block's quicklink.
- **StartDate**. The content block's start date formatted as a .NET date type.
- **Status**. The status of the content block.
  - approved
  - checked out
  - checked in
  - expired
  - pending deletion
  - pending expiration

    - pending start date
    - submitted
- **Teaser**. The content block summary.
- **TemplateLink**. Currently empty and not being used with the ContentBlock server control.
- **Title**. The content block title.
- **UserID**. Last user who edited the content.
- **Xslt1**. The content block's first Xslt, as defined in Ektron.
- **Xslt2**. The content block's second Xslt, as defined in Ektron.
- **Xslt3**. The content block's third Xslt, as defined in Ektron.
- **Xslt4**. The developer can use this property programmatically. Ektron only uses Xslt1, 2 and 3 in the workarea.
- **Xslt5**. The developer can use this property programmatically. Ektron only uses Xslt1, 2 and 3 in the workarea.

Accessing items in an array

To access and manipulate content blocks returned by an object, use the common class `Ektron.Cms.Common.ContentBase`. For example, Search, Collection and ListSummary have `EkItems` (an array of ContentBase), while ContentBlock has a single `EkItem`. This example creates a bulleted list of every item in the collection.

```
dim MyC as new Ektron.Cms.Controls.Collection
MyC.DefaultCollectionID = 1
MyC.ID = "Collection1"
MyC.Page = Page
MyC.Fill()
dim item as Ektron.Cms.Common.ContentBase
MyC.Text = "<ul>"
for each item in MyC.EkItems
MyC.Text &= "<li>" & item.Title & "</li>"
next
MyC.Text &= "</ul>"
Response.Write(MyC.Text())
```

NOTE: For information on using `ekitems` with eCommerce server controls, see Customizing eCommerce server controls with Event Hooks.

Referencing a parent page

Server controls require a reference to their parent page (for example, using the `DynamicParameter` property on a content block to check for a query string). You *must* provide access to the page object if you declared your control in the code-behind. To do this, set the control's `Page` property to the Web page you're working on, as shown in the following example.

```
Ektron.Cms.Controls.Search MySearch = new Ektron.Cms.Controls.Search();
MySearch.Page = Page;
MySearch.Fill();
```

This relationship only is required when inserting a control in the code-behind. When dragging and dropping, even if you make changes in code-behind, the relationship is automatically generated.

BEST PRACTICE

You should include the `Page` property reference when using server controls as components in the code-behind.

Data binding with server controls

With data binding, you can bind Ektron server controls to a GridView Control, DataList Control, or Repeater Control. This gives more flexibility when you use data from the Ektron server controls. Benefits of data binding include ease of data manipulation and the ability to format data.

WARNING! When HTML is bound to a column, you need to add `HtmlEncode = False` to it. Otherwise, the HTML appears as code. For example, `<p>Ektron Inc., an innovator in Web content management software, today announced...</p>`.

The following are data bindable Ektron server controls.

- Collection
- ContentList
- IndexSearch
- ListSummary
- MetaDataList
- RssAggregator

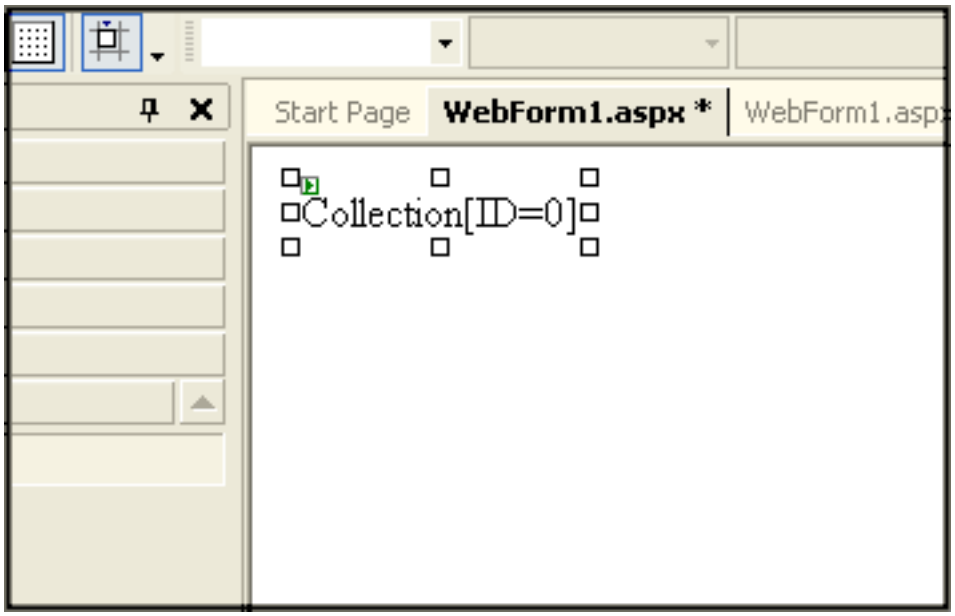
The following example shows code-behind that uses a GridView to display a Collection:

NOTE: For the example code to work properly, you need to drag and drop a GridView server control on a Web form.

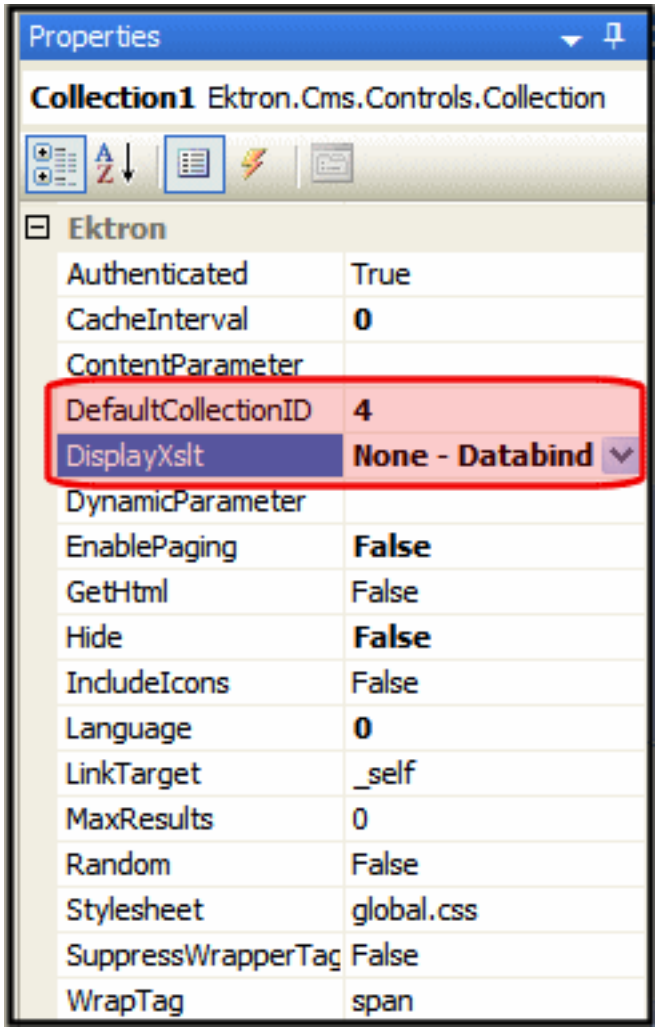
```
Dim myCol As New Ektron.Cms.Controls.Collection
  MyCol.ID = "Collection1"'''Create an ID for the Collection
myCol.DefaultCollectionID = 4
  myCol.Page = Page
myCol.Fill()
GridView1.DataSource = myCol
GridView1.DataBind()
```

Steps to data binding using drag and drop server controls are as follows:

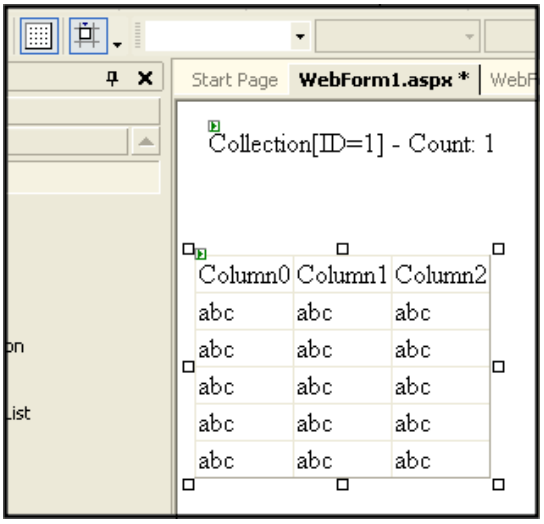
1. Create a new Web form.
2. Drag and drop a data bindable server control on the Web form. For example, a Collection server control.



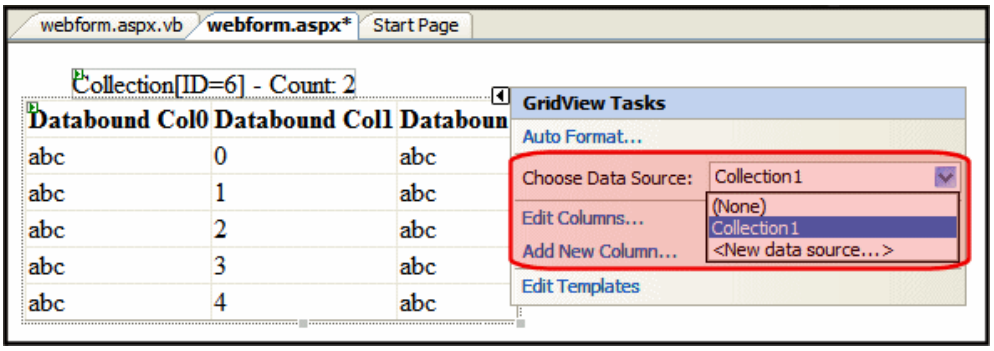
3. In properties, choose a `DefaultCollectionID` for the server control and make sure DisplayXslt is set to **None- DataBind Only**.



4. Drag and drop a GridView on the Web form.



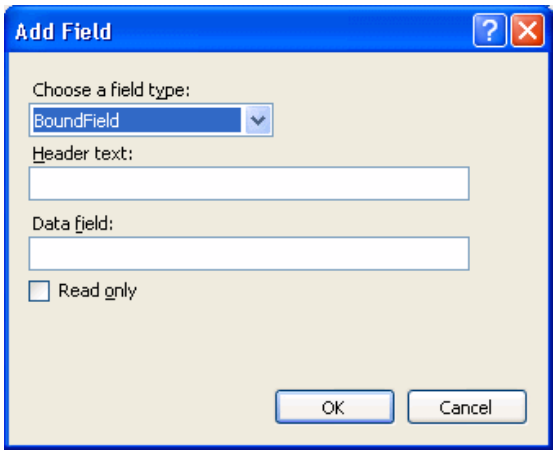
5. In the GridView Tasks, choose the **DataSourceID**.



6. In code-behind, add the following line of code to the Page add field.gif unit event:

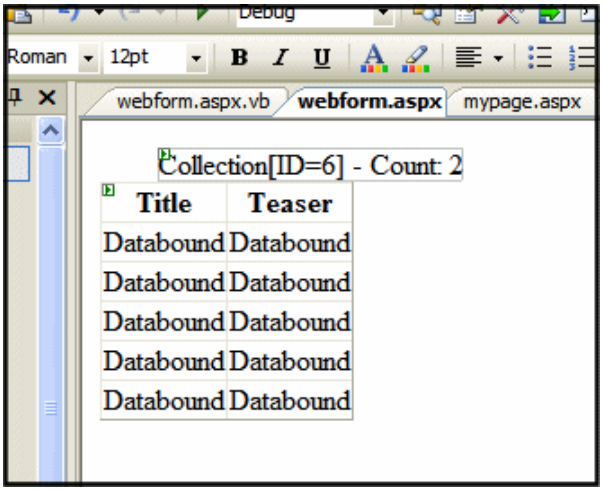
```
Collection1.Fill()
```

7. Select the columns to be databound by clicking **Add New Column** in GridView Tasks.
8. Complete the Add Field window.

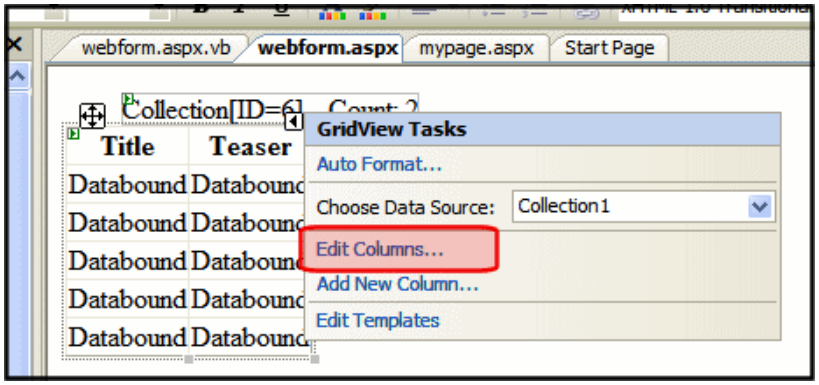


- **Choose a field type**. BoundField
- **Header text**. The title name for each column.
- **Data field**. The data to bind to each column. Choose one of the following:
  - **ID**. The content block ID
  - **Title**. The content block title
  - **Teaser**. The content summary
  - **Html**. The HTML content
  - **StartDate**. The content's start date
  - **DateModified**. The content's last modified date
  - **EndDate**. The content's end date
  - **LastEditorFname**. The last editor's first name
  - **LastEditorLname**. The last editor's last name
  - **QuickLink**. The content's quicklink
  - **HyperLink**. The content's hyperlink
  - **DisplayStartDate**. The string representation of the start date
  - **FolderID**. The folder ID where the content is located
  - **ContentStatus**. The content's status
  - **Language**. The content's default language
  - **DisplayDateModified**. String representation of the content's last modified date
  - **DisplayEndDate**. String representation of the content's end date
  - **EndDateAction**. An action tied to end date. For example, Refresh_Report
  - **Comment**. The content's comments

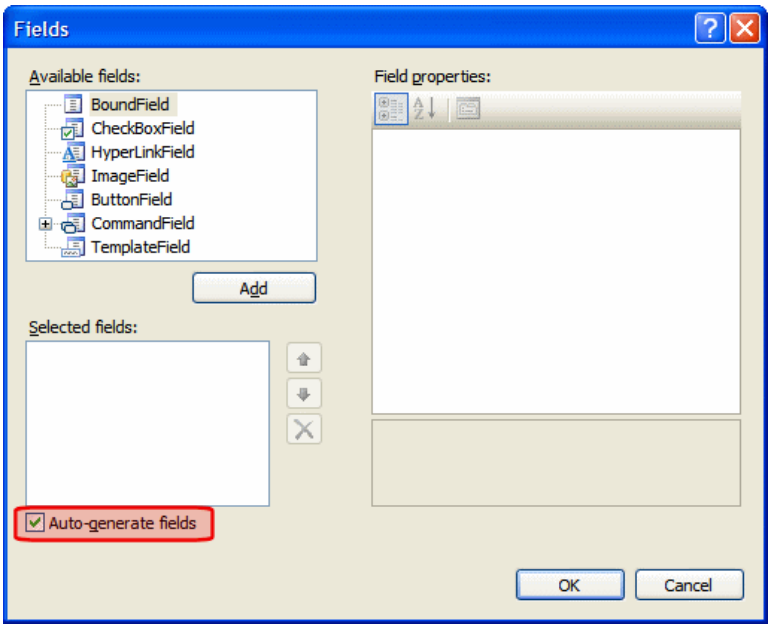
9. Click **OK**.
10. Repeat steps 6, 7 and 8 for each column you want to add.



11. If you want to add all of the columns automatically, in the GridView Task menu click **Edit Columns**. Otherwise, skip to step 13.



12. Click the **Auto-generate fields** checkbox.



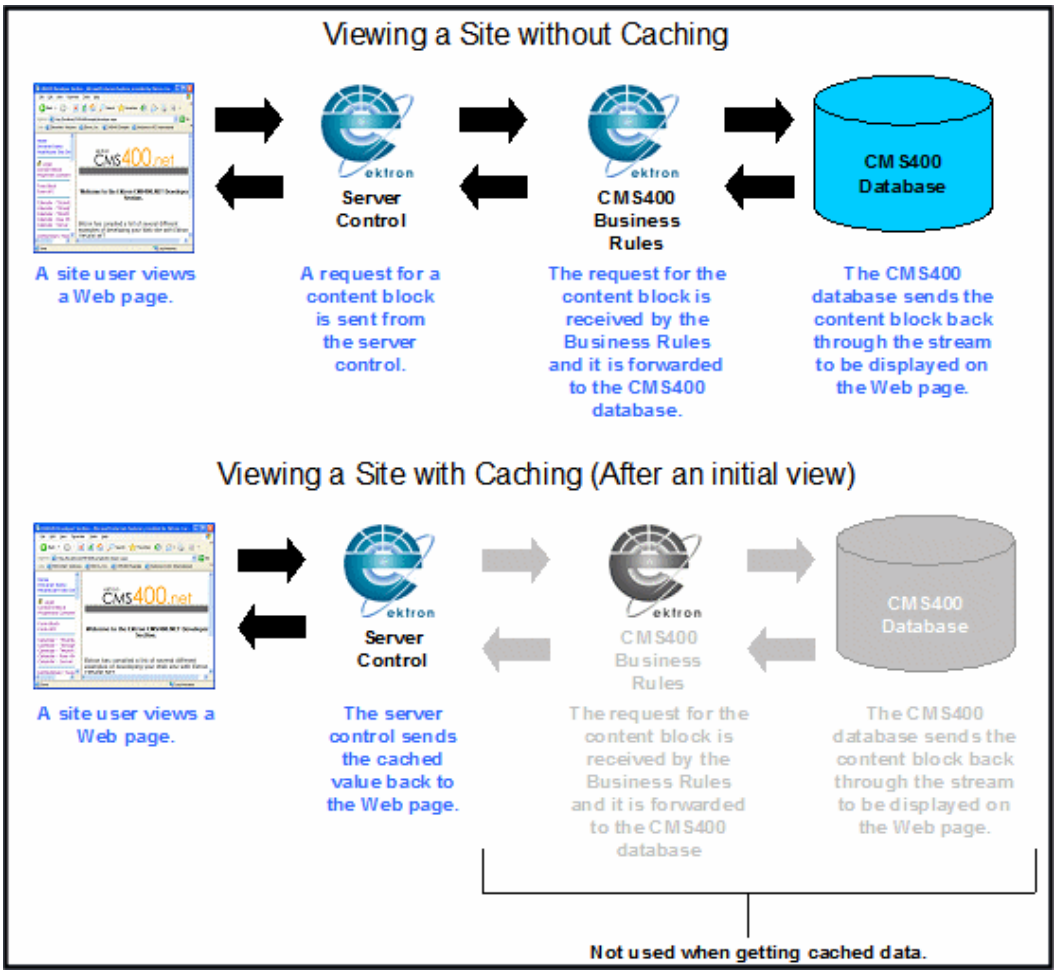
13. Click **OK**.
14. From the Build menu, click **Build Page**.
15. In design view, right click the form and select **View in Browser**.

Title	Teaser
Ektron Rated Positive	Ektron Inc., an innovator in Web content management software, today announced ...
Ektron to Demonstrate Healthcare	"Healthcare Content Indexing Framework" which enables hospitals, medical groups and health insurers to deliver indexed content via the Web.

For more information on GridView, DataList, Repeater and DetailsView, see the help inside Visual Studio.

Caching with server controls

High-performance, scalable Web applications store items in memory after the first time they are requested. The items include data objects, pages, and parts of a page. Caching saves and later reuses page output or application data across HTTP requests. You can store items on the Web server or other software in the request stream, such as the proxy server or browser. Caching saves time and resources because the server does not have to recreate information, particularly things that demand significant processor time or other resources. The following image contrasts data flow in non-cached and cached environments.



Ektron provides 2 kinds of caching.

- *Caching while logged In* below. Lets you cache part of a Web page; available with some server controls
- *Page-level caching* on the next page. Lets you cache an entire page while not logged in; available with all server controls

Caching while logged In

When a user is logged in, changes appear on the site only after time defined in the cache interval. This reduces the number of database hits, which improves your server's performance. For example, if you add a new item to a Collection, the change

only appears on the site when the cache interval expires. In the meanwhile, use Preview mode to see the updated Collection immediately.

The following server controls can cache individual content while you are logged in.

- Collections
- ContentList
- DhtmlMenu
- ListSummary
- MetadataList
- Menu

IMPORTANT: Caching while logged in does not work with Private content.

To set up caching of content for a Web page:

1. Set the *siteroot*/web.config file's ek_CacheControls property's value to "1".
2. Add to a Web form a server control that supports caching of individual content.
3. Set the control's CacheInterval property to the number of seconds for which data should be cached. For example, to cache for 5 minutes, set CacheInterval to 300.

   The default value is 0 seconds. So, you must change the default to enable caching.

Page-level caching

The following controls can cache individual content while you are not logged in.

- ActiveTopics
- All blog controls
- Collections
- CommunityDocuments
- CommunityGroupBrowser
- CommunityGroupList
- CommunityGroupMembers
- CommunitySearch
- ContentBlock
- ContentList
- DhtmlMenu
- Directory
- Favorites
- FlexMenu
- FormBlock
- Forum
- Friends

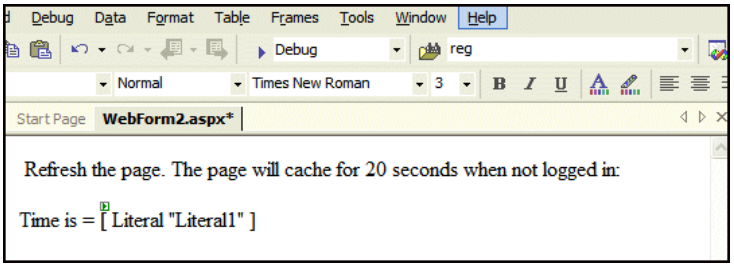
- ListSummary
- MetadataList
- Menu
- Poll
- PostHistory
- SiteMap
- SmartMenu
- TagCloud
- UserProfile

The following example shows a page-level cache for non-logged-in users. You use a server control to define whether a user is logged in, then define if the page is cached, based on the user's status.

1. Create a new Web form in your Ektron project.
2. Add the following text to the Web form:

```
Refresh the page. The page will cache for 20 seconds when not logged in:
Time is =
```

3. Next to **Time is =**, add a literal.



4. Below that, add a ContentBlock server control.
5. Set the DefaultContentID. For this example, `DefaultContentID = 20`.
6. Add the following to the Page_Load event in the code-behind.

```
If Not ContentBlock1.IsLoggedIn Then
  Response.Cache.SetExpires(DateTime.Now.AddSeconds(20))
  Response.Cache.SetCacheability(HttpCacheability.Public)
  Response.Cache.SetValidUntilExpires(True)
  Response.Cache.VaryByParams("id") = True
```

NOTE: On a PageBuilder page, you would use `Response.Cache.VaryByParams ("pageid") = True`.

```
Response.Cache.SetVaryByCustom("cmsCache")
End If
Literal1.Text = Now()
```

7. Build your Web form.
8. Browse to your Web form using a browser.
9. Press your browser's refresh button. If you are not logged in to Ektron, the time remains for twenty seconds. After twenty seconds, when you refresh, the new time appears.

NOTE: You can use the same code in a user control to cache output in a particular region of the page.

Displaying custom XML in Ektron's server controls

Several Ektron server controls have a CustomXml property to add custom XML to a control's generated XML before it is processed by its XSLT. Use the CustomXml property in code-behind with these server controls:

- Cart
- Checkout
- CurrencySelect
- MyAccount
- OrderList
- Product
- ProductList
- ProductSearch
- Recommendation

The following examples shows a C# usage of the CustomXml property in code-behind.

```
protected void Page_Load(object sender, EventArgs e)
       {
       product1.CustomXml =
         "<banner>Save $$$ While Christmas Shopping!</banner>
       <specials><special><link>ProductDemo.aspx?id=1013</link>
       <text>A great gift for Dad!</text></special><special>
       <link>ProductDemo.aspx?id=1015</link><text>
       A great gift for Mom!</text></special></specials>";
       }
```

The following example shows the XML sent to the XSLT file.

```
<root>
  <customXml>
    <banner>Save $$$ While Christmas Shopping!</banner>
       <specials>
          <special>
               <link>ProductDemo.aspx?id=1013</link>
               <text>A great gift for Dad!</text>
          </special>
          <special>
               <link>ProductDemo.aspx?id=1015</link>
               <text>A great gift for Mom!</text>
          </special>
       </specials>
   </customXml>
</root>
```

Learning about Visual Studio

This section provides background information about Microsoft's Visual Studio. For more information, use the help feature installed with Visual Studio and Microsoft's developer Center (Microsoft Visual Studio).

NOTE: The following definitions are from Visual Studio Help.

- **Grid Layout**. Absolute positioning attributes are inserted into elements that are added, and updated in elements that are moved. Elements can be dragged across the Design view surface. The positioning grid and Snap to Grid are available.
- **Flow Layout**. Elements are added without absolute positioning attributes. Web browsers arrange elements in the order that they occur on the page, from top to bottom. You cannot drag elements across the Design view surface or use the positioning grid.

Grid layout is the default, which means that all controls drawn to the Web form in the designer window have absolute positioning. Here is an example.

```
<body MS_POSITIONING="GridLayout">
<form id="Form1" method="post" runat="server">
  <asp:Button id="Button1" style="Z-INDEX: 101;
    LEFT: 160px; POSITION: absolute;
    TOP: 80px" runat="server" Text="Button">
  </asp:Button>
  <asp:Button id="Button2" style="Z-INDEX: 102;
    LEFT: 480px; POSITION: absolute;
    TOP: 88px" runat="server" Text="Button">
  </asp:Button>
  <asp:GridView id="GridView1" style="Z-INDEX: 103;
    LEFT: 208px; POSITION: absolute;
    TOP: 152px" runat="server">
  </asp:GridView>
</form>
</body>
```

In Grid layout, you can position your controls like a WYSIWYG editor with no knowledge of HTML. However, because absolute positioning is not rendered consistently by all browsers, the page layout can be flexible based on the size of other controls on the page, and the Web browser window.

When other controls are dynamically populated, such as a GridView, controls that appear beneath it in the Web form would be obscured if they were positioned absolutely at design time. In addition, when utilizing globalization of pages with different languages, the size of text areas can vary and cause obstructions.

Using Ektron's Developer SDK

The Developer Software Distribution Kit (SDK) for Ektron contains the following components to help you extend and customize your site.

- **Developer API**, which includes:
  - **Server Control API**. An interface for calling the methods and properties of the Ektron server controls. For additional information on the server controls, see Introduction to server controls and the Developer API Documentation.
  - **Web Services API**. Exposes a method's functionality for use with SOAP over HTTP. For additional information on the Web Services, see Web Services and the Developer API Documentation.
  - **.NET Assembly API**. Similar to the Business API provided in previous version, the .NET Assembly API provides an interface for calling the methods and properties that are exposed in Ektron. The Developer API Documentation.
- **Developer API Documentation**

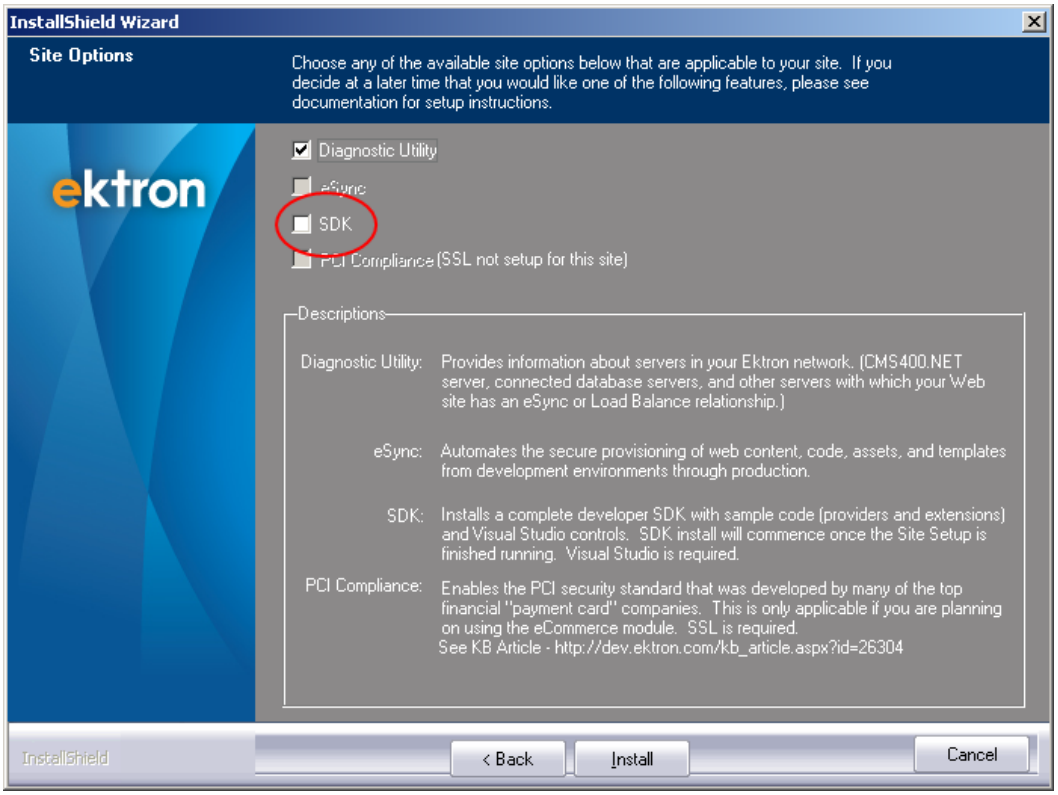
  The API Documentation contains a detailed description of the functions included in each of the APIs. To access the Developer's API documentation in Visual Studio, choose **Help > Contents**. Next, choose Ektron API Documentation from the list of contents. You can also filter the documentation so you see only Ektron's API documentation. Click **Ektron API Documentation** in the filter drop-down box. See also: *Framework API* on page 153.
- **Strategies**

  Strategies are developer-defined software modules that modify the behavior of Ektron.

  NOTE: In versions previous to Ektron version 8.00, developers used the Plug-in Extension Wizard to extend the system. As of version 8.00, Extensions are preferred over the Plug-in system. As of version 9.00, use Strategies. See also:*CMS strategies* on page 2561
- **Ektron server controls Toolbox**

  Ektron controls are installed with the Developer SDK. Server controls let you insert, via drag and drop or programmatically, many standard methods and properties within the Visual Studio environment. This means that you can see the effect of your changes in real time -- you don't have to modify a page then compile a sample project to see the results.

You can install the Developer SDK appears during installation or upgrade of Ektron.



If **Developer SDK** is not checked during installation, you can install it by going to Windows **Start** button **> All Programs > Ektron > CMS400vx*x* > Utilities > CMS400SDK Install**, which runs the `CMS400SDK_setup.exe` installation program.

If you're using Windows 8 or 2012, press the **Windows** key ( )**/Q** then enter **CMS400SDK Install**.

ActiveTopics

8.60 and higher

The ActiveTopics server control displays a forum's most active or most recent topics. The most active are determined by the number of new posts in a topic, or how many replies a post receives.

Inserting the ActiveTopics server control onto a page

PREREQUISITE

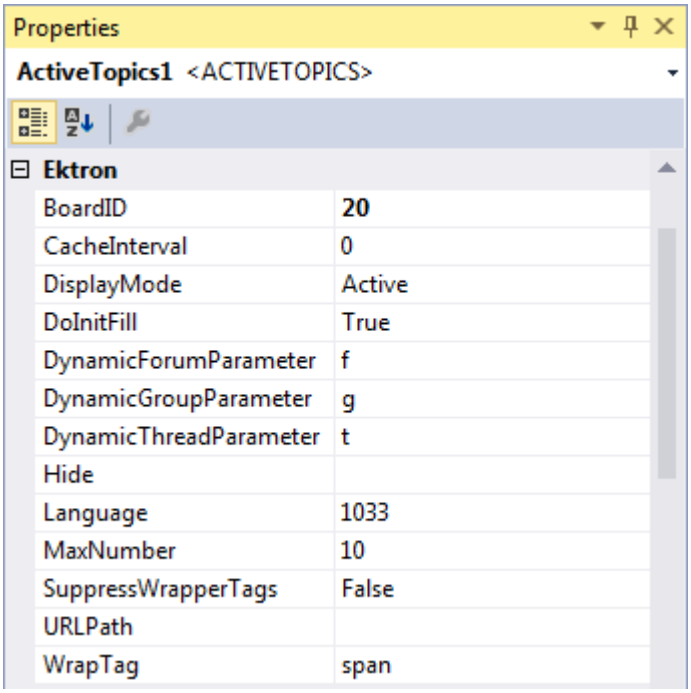
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ActiveTopics** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:ActiveTopics ID="ActiveTopics1" runat="server" />
```

4. Click on `ActiveTopics` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ActiveTopic properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BoardID** (Long)
  The ID of the board from which to get entries. If you don't know the ID, click **Ellipses** (...), then sign in, browse to, and select a discussion board.
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DisplayMode** (eDisplayMode)
  Choose between Active or Recent. The default is Active.
  - **Active**. Lists the most active posts.
  - **Recent**. Lists recently added posts.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Select **False** to display this server control on the page. Select **True** to suppress it.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MaxNumber** (Integer)
  The maximum number of topics listed. The default is **10**.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **URLPath** (String)
  Enter the path to the Forum server control's Web page. For example: `http://<your site>/siteroot/forum.aspx` or `/CMS400Developer/forum.aspx`. If your Forum page and your Active Topics page are in the same folder, just enter the name of the page. For example: `forum.aspx`.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

AnalyticsTracker

8.50 and higher

Track business analytics statistics about visits to your site, such as:

- how often content is viewed
- how many site visitors viewed for first time, and how many returned
- the most popular referral pages

The data recorded by this server control is used by the Most Popular and Trends widgets' **Most Viewed** category. See also: Analyzing Websites

The data recorded is also used by the Classic Analytics Reports, available from the Ektron Workarea **> Reports > CMS Site Analytics** section.

IMPORTANT: Your site license key must support Analytics. You must also set the control's `enableanalytics` property to `true` or set the `enableanalytics` property to `ConfigSpecified`, and the `enableAnalytics` key in your `web.config` file to `true`

Use the ContentIdsList, DefaultContentID, and the DynamicParameter propertiesto determine which content items are viewed when a site visitor browses to a page that contains the control. The properties are additive; that is, they can be used together.

If you want to track your entire site, place an AnalyticsTracker server control on your master pages on your site templates, and use the `DynamicParameter` property.

Inserting the AnalyticsTracker server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

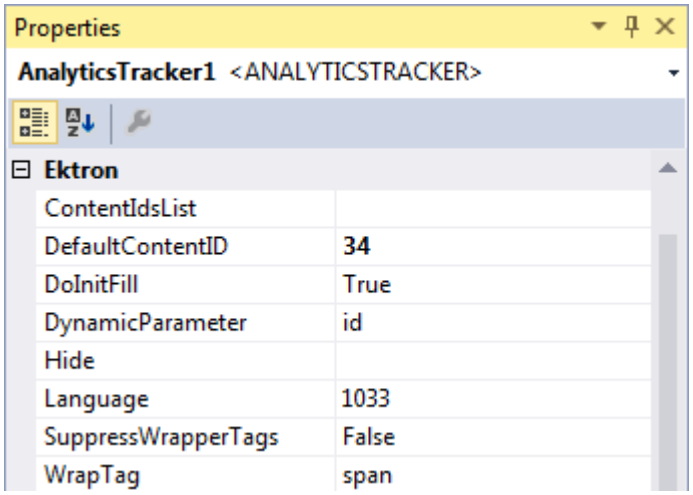
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **AnalyticsTracker** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:AnalyticsTracker ID="AnalyticsTracker1" runat="server" />
   ```

4. Click on `AnalyticsTracker` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



AnalyticsTracker properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **ContentIdsList** (String)

  Enter a comma-separated list of content IDs to be tracked. The DefaultContentId and the dynamicParameter are also tracked. See also: Analyzing Websites

- **DefaultContentID** (Long)

  The ID of a content block being tracked by this server control. It typically would be the content directly above the AnalyticsTracker if no other content block is identified, or is not available. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  To make this control dynamic, select **id**. When you do, this server control is attached to the content block passed as a URL parameter.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

AssetControl

8.50 and higher

The AssetControl server control, when viewed on a Web form, displays a drag and drop icon that lets you upload a new asset or update an existing one. When you click this icon, a drag and drop box appears. This box is similar to the upload box in the Workarea. The difference between the Workarea and the server control is, in the Workarea users can only upload assets. With the AssetControl server control, you can upload a new asset or update an existing one by overwriting it. If the asset is overwritten, the previous version is available through Ektron's history feature. See also: Managing Versions of Content.

The appearance of the AssetControl server control can vary depending on your browser. See also: Methods for Importing Assets.

Inserting the AssetControl server control onto a page

PREREQUISITE

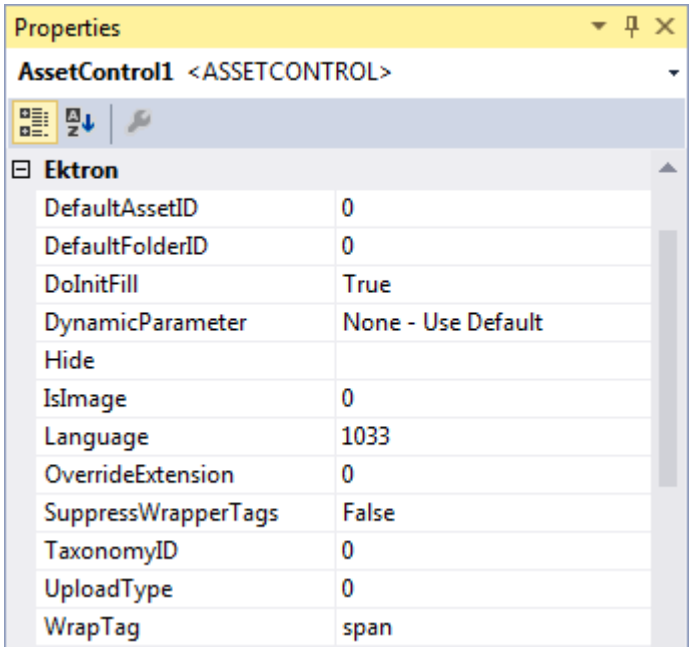
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **AssetControl** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:AssetControl ID="AssetControl1" runat="server" />
```

4. Click on `AssetControl` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



AssetControl properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DefaultAssetID** (Long)

  The ID of the asset you want to update. This property is used when the `UploadType` property is set to **Update**. If you don't know the ID number of the asset, use the CMS Explorer to browse to it. See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DefaultFolderID** (Long)

  The ID of the folder where assets are added. This property is used when the `UploadType` property is set to **Add**. If you don't know the ID number of the folder, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID or folder ID dynamically. The content ID is read when the `UploadType` property is set to

Update. The folder ID is read when `UploadType` property is set to Add. To use the default content ID or default folder ID, leave blank.

- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IsImage** (Integer)
  Setting this control to 1 (one) restricts the control so only images can be uploaded.
  - **1** (one). Restrict the control to uploading images only.
  - **0** (zero). Upload all types of assets.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **OverrideExtension** (String)
  Lets you restrict the type of asset that can be uploaded by its extension. For example, to restrict the control to uploading Word documents, enter **doc** in the property.

  NOTE: When using this property, enter only the extension's letters not the wildcard (*) or the dot (.).

  You can add multiple extensions by creating a comma separated list of extensions. You should limit the list to 5 extensions.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TaxonomyID** (Long)
  The ID of the taxonomy with which to associate the asset.
- **UploadType** (UploadTypeEnum)
  Select whether the control adds new assets or updates existing ones.
  - **Add** (default). Add assets and use the `DefaultFolderID` property. If a file of the same name already exists in the folder, the new file is created using the naming convention `filename(2)`.
  - **Update**. Update assets. In this case, you *must* identify an asset at the `DefaultAssetID` property.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.

- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

Blog server controls

8.50 and higher

Ektron provides server controls for displaying a blog on a website. The Blog server control lets you display pieces that typically make up a blog site on a Web form, such as blog entries, posts, subjects, recent posts, RSS feed, archive, calendar, and a blog roll.

Additional Blog server controls let you display each item individually and offer additional ways to customize the layout and appearance. For example, you might display Blog entries and a Blog roll but not a Blog calendar. The individual Blog server controls also let you further define the display details.

NOTE: On a PageBuilder page, you can insert a blog using the Blog widget.

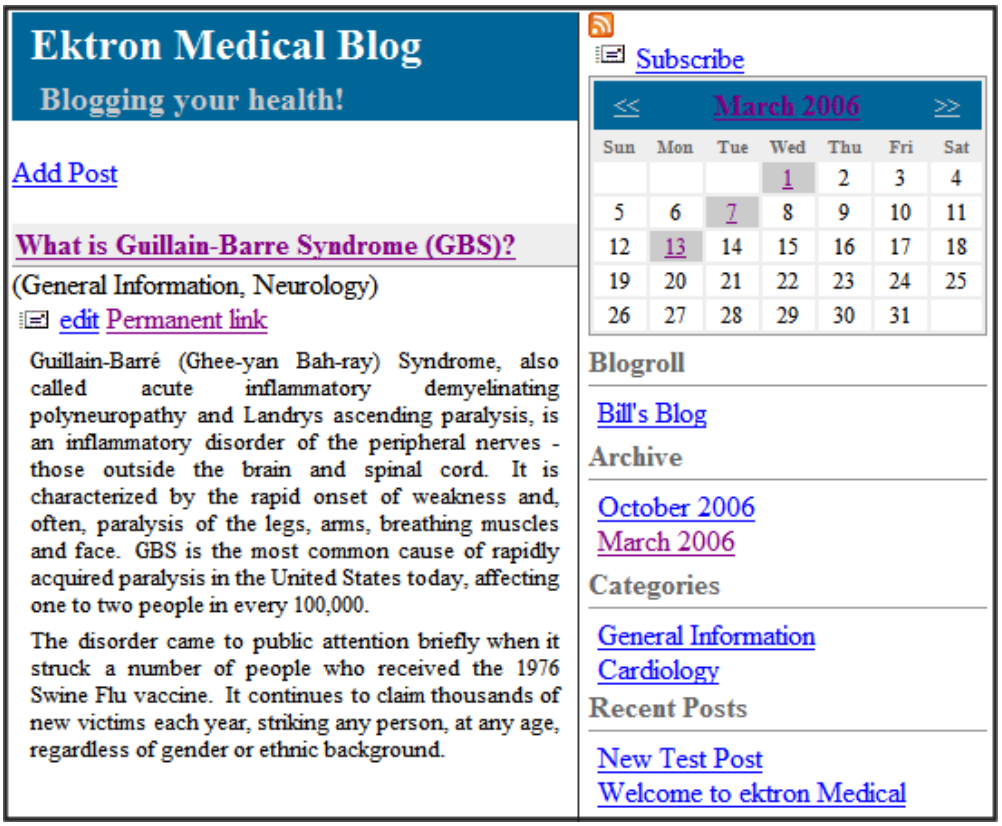
The Blog server controls are as follows:

Blog

8.50 and higher

The Blog server control lets you add a blog to a Web form. This control has the items commonly found on a blog page, such as blog posts, comments link, a blog roll, blog subjects, recent blog posts, the blog's RSS feed, archive, and a blog calendar.

The Blog server control lets you easily maintain the overall look of the blog. Any change to display properties, such as background color or font, affects the entire blog. However, you cannot change the location of each server control item. The title always appears on top, with the tagline below it. The blog posts always appear to the left,and the calendar, blog roll, blog subjects, recent blog posts, RSS feed, archive and blog roll to the right.



NOTE: You can use individual blog server controls to change the page layout.

Inserting the Blog server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

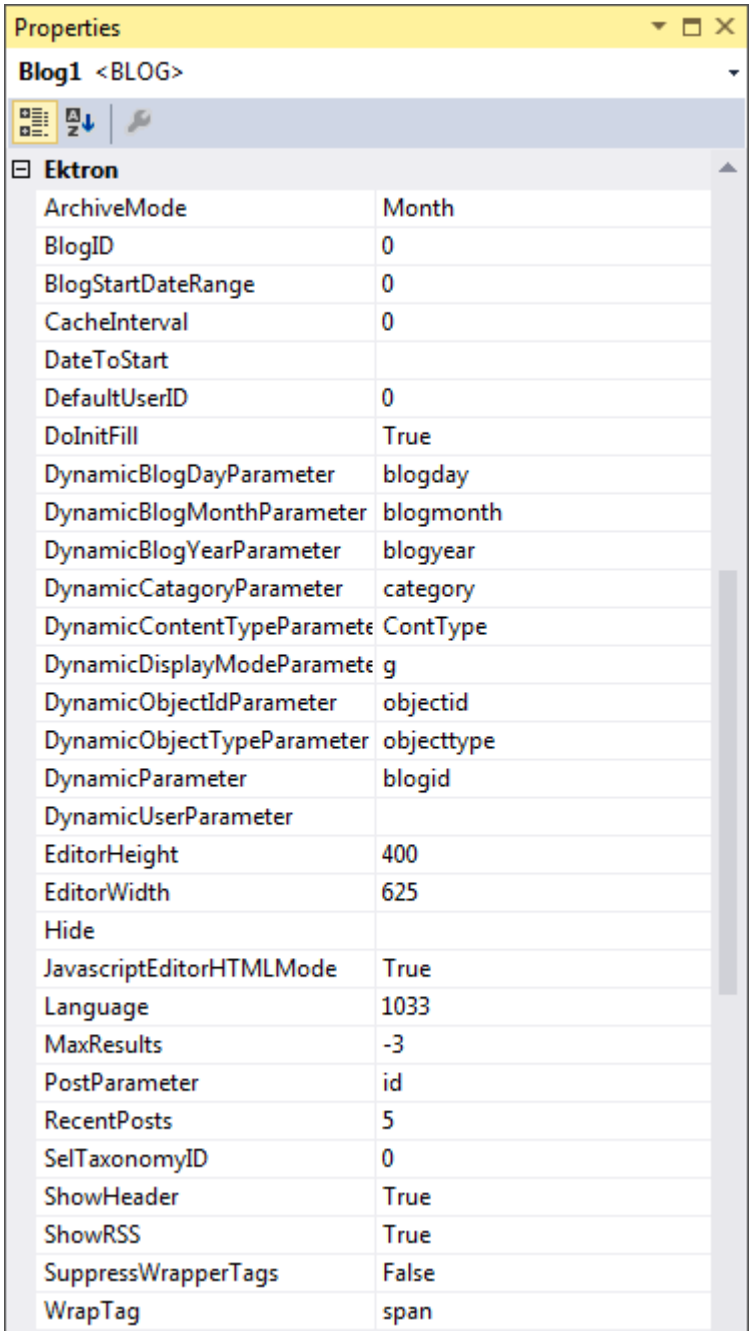
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Blog** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Blog ID="Blog" runat="server" />
```

4. Click on `Blog` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.

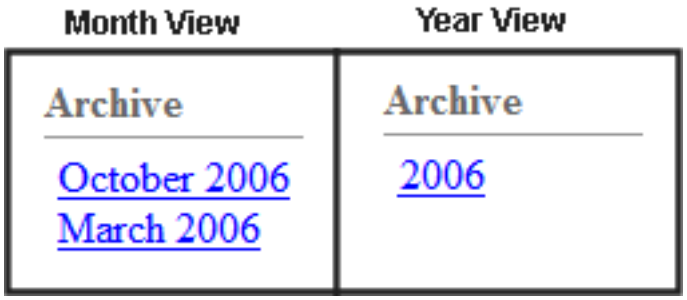


Blog properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **ArchiveMode** (String)

  Select whether the archive appears in *month* format or *year* format. The default is **month**



- **BlogID** (Long)
  The ID of the blog in Ektron. For example: 41. If you don't know the blog ID, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147
- **BlogStartDateRange** (String)
  Set the date range of the Blogs to show. For example, if you want to display blogs for only the past 3 months, set this value to *Quarterly*.
  - **None**. No start date range
  - **Monthly**. Current month
  - **Quarterly**. Past 3 months
  - **BiYearly**. Past 6 months
  - **Yearly**. Past 12 months
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DateToStart** (DateTime)
  The date of the most recent blog entries to appear. For example, to display blog entries for January 1, 2012 and before, enter 1/1/2012. Click the drop-down box to access a calendar.
- **DefaultUserID** (Long)
  The ID of the user who owns the blog to be displayed. This property is used when the server control displays a user's blog. To display a blog not associated with a user, leave this property set to 0 (zero) and enter the blog's ID in the `BlogID` property.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Gets or sets the QueryString parameter to read a Blog ID dynamically. Set to **None. Use Default** if you want to always display the default blog.

- **None. Use Default**. Use the default Blog ID list.
- **ekfrm**. Reads a form block's ID dynamically.
- You may display blogs dynamically by entering any value other than **id**. **id** is the default parameter for **PostParameter**.

- **DynamicUserParameter** (String)
  Gets or sets the QueryString parameter to read a user ID dynamically. Set to **Use Default** if you wish to always display the default user's blog (static).
- **EditorHeight** (Integer)
  Sets the height of the blog editor in pixels.
- **EditorWidth** (Integer)
  Sets the width of the blog editor in pixels.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MaxResults** (Integer)
  Set the maximum number of posts to display. If set to 0 (zero), there is no limit. If set to

  -1. All posts for the day are shown

  -2. All posts for the month are shown

  -3. Use the **# of Post Visible** setting in the Workarea.

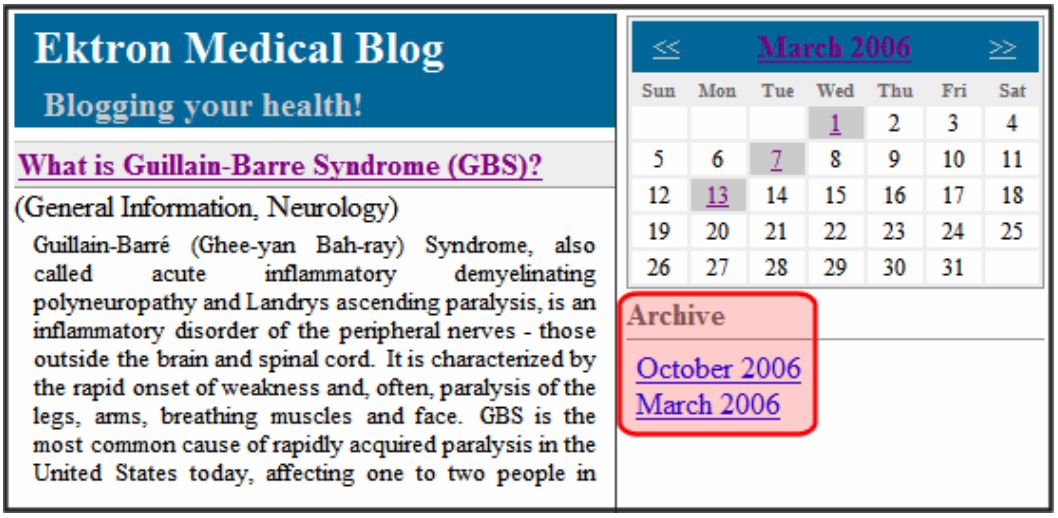
  The default is **-3**.
- **PostParameter** (String)
  Works like the `DynamicParameter` for content blocks. When `id` is selected, this server control passes the blog post ID as a URL parameter. The default setting is **id**.
  - **Blank**. The list of blog posts is static. The links in the blog posts are inactive.
  - **id**. The id of the blog post is passed to the URL as a parameter.
  - **None use default. T**he list of blog posts is static. The links in the blog posts are inactive.
- **RecentPosts** (Integer)
  The number of post links contained in the Recent Posts list. The default is 5.

- **SelTaxonomyID** (Integer)
  Set the ID of the taxonomy with which content is associated if a logged-in site visitor uses the Silver Access Point's **Add HTML Content** option to add content to a Collection server control.
- **ShowHeader** (Boolean)
  - **True** (default). Show title and tagline.
  - **False**. Do not show header and tagline.
- **ShowRSS** (Boolean)
  - **True** (default). Show RSS feed icon ( ).
  - **False**. Do not show RSS feed icon.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

BlogArchive

8.50 and higher

The BlogArchive server control displays past months or years that have blog posts. Use this control with the BlogEntries and Calendar controls to let site users scan for older Blog posts.



When a site visitor clicks a month in the archive, the blog posts for that month appear.

Typically this control appears along side other individual Blog server controls.

Inserting the BlogArchive server control onto a page

PREREQUISITE

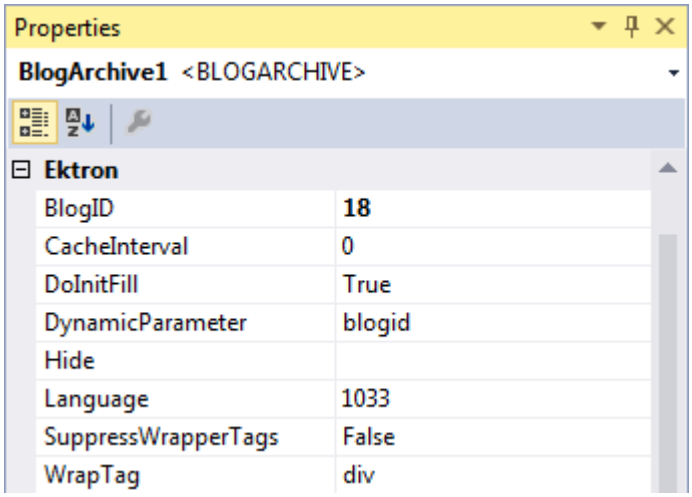
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogArchive** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:BlogArchive ID="BlogArchive1" runat="server" WrapTag="div" BlogID="18" />
   ```

4. Click on `BlogArchive` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogArchive properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

  The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Sets the QueryString parameter to read a Blog ID dynamically. Leave blank to always display the default blog.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

BlogCalendar

8.50 and higher

The BlogCalendar server control displays a calendar on a Web page and associates it with a blog. Days with blog posts are highlighted on the calendar. You can use a BlogCalendar server control with a BlogEntries server control to display blog posts for a given day.

Inserting the BlogCalendar server control onto a page

PREREQUISITE

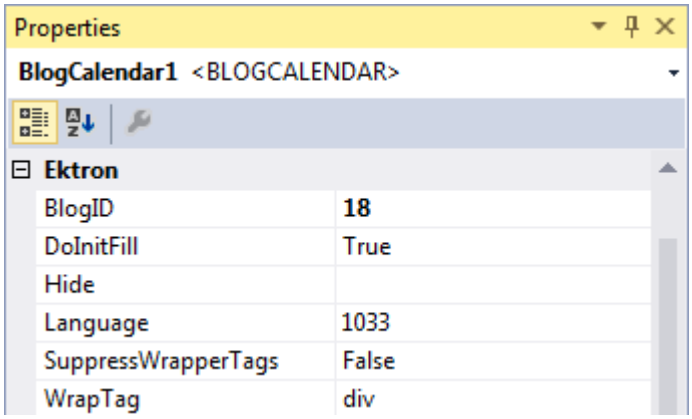
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogCalendar** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogCalendar ID="BlogCalendar1" runat="server" />
```

4. Click on `BlogCalendar` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogCalendar properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

  The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

BlogCategories

8.50 and higher

The BlogCategories server control displays a blog's subjects as a clickable list of links on a Web form. When a link is clicked, it displays all subjects associated with the category. Typically, this control appears with other Blog server controls.

Inserting the BlogCategories server control onto a page

PREREQUISITE

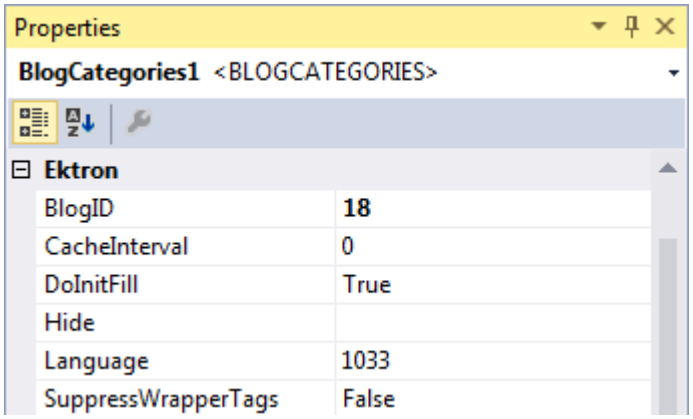
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogCategories** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:BlogCategories ID="BlogCategories1" runat="server" />
   ```
4. Click on `BlogCategories` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



BlogCategories properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

  The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **SuppressWrapperTags** (Boolean)

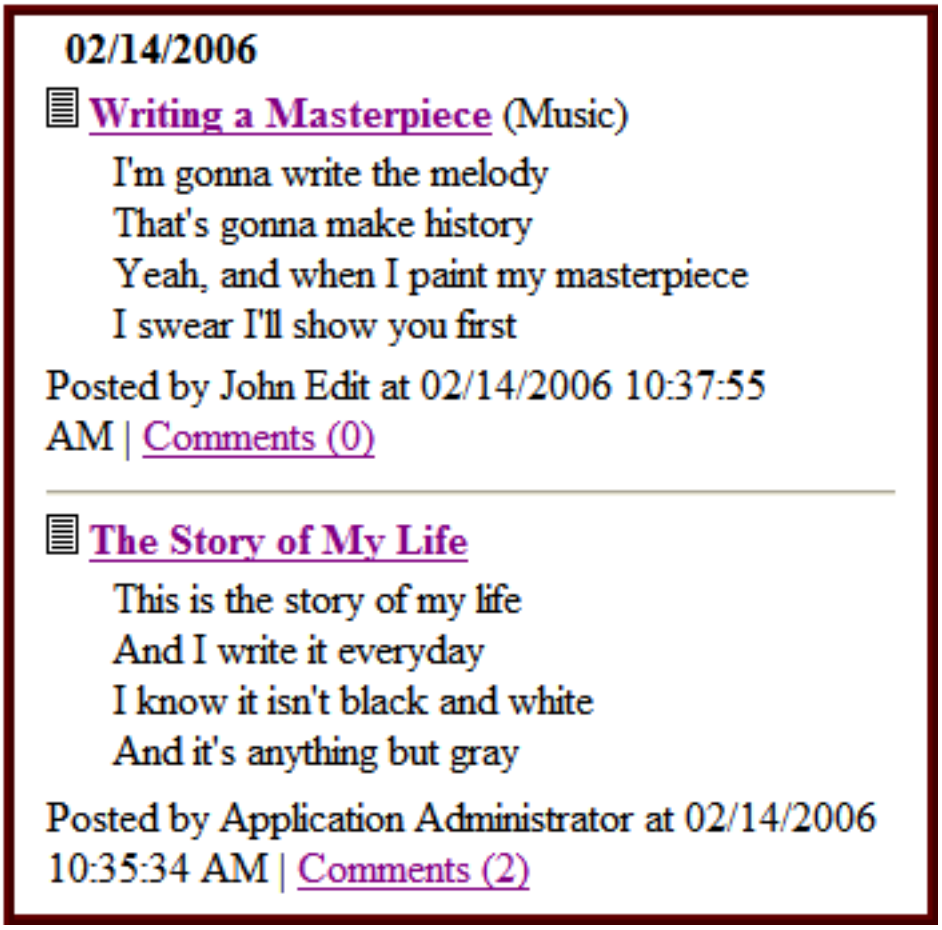
  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

BlogEntries

8.50 and higher

The BlogEntries server control displays several blog posts or a user's Journal (personal blog) on a Web form. You can change this server control's appearance without changing the other blog controls. The following example shows a BlogEntries server control.



To use this server control to dynamically display a *blog's* entries, set the following properties:

- `DynamicParameter`. Set this property to the parameter name used to pass a blog ID to the QueryString. The default is **blogid**.
- `BlogPostParameter`. Set this property to the parameter name used to pass a blog post's ID to the QueryString. The default is **id**.

To use this server control to dynamically display a *user's Journal*, set the following properties:

- `DynamicUserParameter`. Set this property to the parameter name used to pass a user's ID to the QueryString.

- `BlogPostParameter`. Set this property to the parameter name used to pass a blog post's ID to the QueryString. The default is **id**.

Inserting the BlogEntries server control onto a page

PREREQUISITE

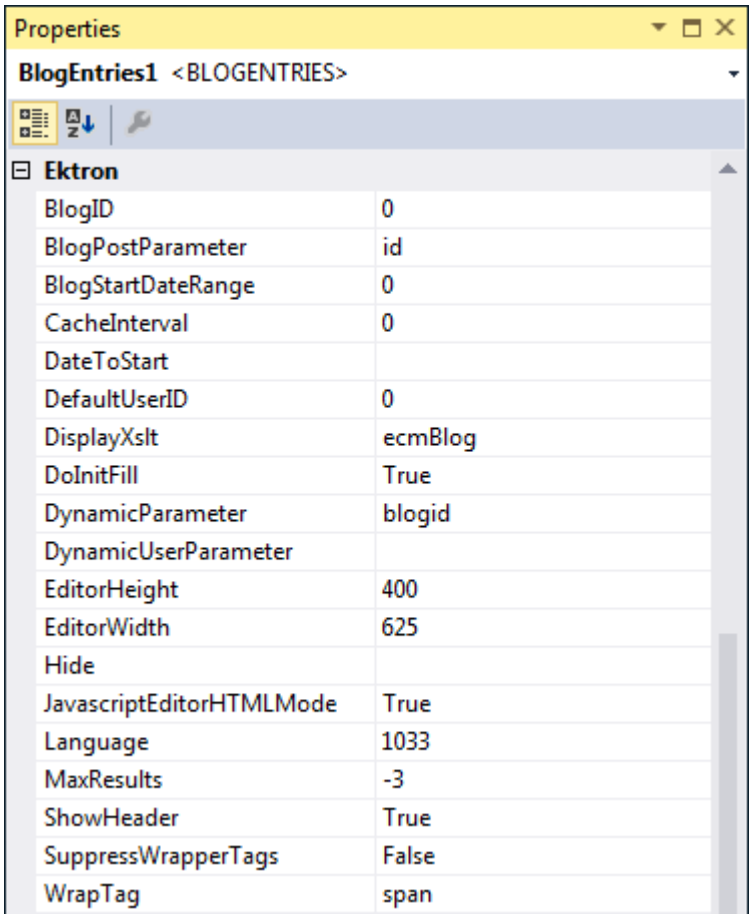
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogEntries** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogEntries ID="BlogEntries1" runat="server" />
```

4. Click on `BlogEntries` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogEntries properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

  The ID of the blog in Ektron from which blog entries are displayed; for example, 41. This is the default ID that is used when a blog ID is not passed dynamically to the QueryString. To pass a blog ID dynamically, set the `DynamicParameter` property. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **BlogPostParameter** (String)

  Set this property to the parameter name used to pass a blog post's ID to the QueryString. The default is **id**. When a parameter is defined, this server control passes the blog post's ID as a URL parameter. If you do not set this parameter to **id**, you will not be forwarded to the blog post's page when you click on any links in the post. The default setting is **id**.

  - **Blank**. The list of blog posts is static. The links in the blog posts are inactive.
  - **id**. The ID of the blog post is passed to the URL as a parameter.
  - **None use default. T**he list of blog posts is static. The links in the blog posts are inactive.

- **BlogStartDateRange** (String)

  Set the date range of the Blogs to show. For example, if you want to display blogs for only the past 3 months, set this value to *Quarterly*.

  - **None. N**o start date range
  - **Monthly. C**urrent month
  - **Quarterly. P**ast 3 months
  - **BiYearly**. Past 6 months
  - **Yearly**. Past 12 months

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DateToStart** (DateTime)

  The date of the last blog entries you want to appear. For example, if you want to display blog entries for January 1, 2012 and before, enter 1/1/2012. Click the drop-down box to access a calendar.

- **DefaultUserID** (Long)

  The ID of the user who owns a Journal from which to display journal entries. To display journal entries not associated with a user, leave this property set to 0 (zero) and enter the blog's ID in the `BlogID` property.

  WARNING! If you define a DefaultUserID, it overrides the BlogID property.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a Blog ID dynamically. Set to "None. Use Default" if you want to always display the default blog. The default is **blogid**.

  NOTE: If an ID for this property is passed on the QueryString and a an ID for the DynamicUserParameter property is passed the control displays blog entries for a user.

- **DynamicUserParameter** (String)

  Gets or sets the QueryString parameter to read a User ID dynamically. Set to **Use Default** if you wish to always display the default user's blog (static.)

  NOTE: If an ID for this property is passed on the QueryString and a an ID for the DynamicUserParameter property is passed the control displays blog entries for a user.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **MaxResults** (Integer)

  Set the maximum number of posts to display. The default is **-3**.

  - **0** (zero). No limit
  - **-1**. All posts for the current day
  - **-2**. All posts for the current month
  - **-3**. The **# of Post Visible** Workarea setting

- **ShowHeader** (Boolean)
  Shows the title and tagline when set to True. The default is **True**.
  - **True**. Show title and tagline.
  - **False**. Do not show header and tagline.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

BlogPost

8.50 and higher

The BlogPost server control displays an individual blog post on a page. There are 2 ways that this control displays a blog post.

- If a user is *logged in* as an Ektron or a membership user, the control displays the blog post, comments, and comments from the Web page.
- If a user is *not logged in*, the control displays only the blog post.

NOTE: The **Enable Comments** property in the Workarea must be enabled for comments and the comments form to appear.

Inserting the BlogPost server control onto a page

PREREQUISITE

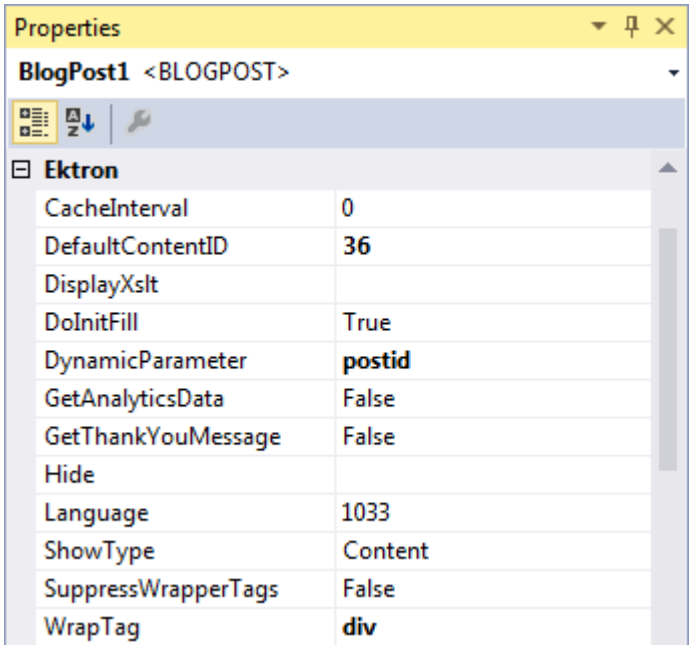
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogPost** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogPost ID="BlogPost1" runat="server" />
```

4. Click on `BlogPost` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogPost properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultContentID** (Long)

  The ID of a default blog post that appears where you inserted this server control if no other content block is identified, or is not available. If you don't know the ID number of the blog post, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  To make this blog post dynamic, select **id**. When you do, this server control uses the blog post passed as a URL parameter.
- **GetAnalyticsData** (Boolean)
  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.
- **GetThankYouMessage** (Boolean)
  Determines whether a message appears after adding a blog comment.
  - **True**. Displays "Thank you" message after adding a blog comment
  - **False**. Do not display the message.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **ShowType** (String)
  Shows a blog post's content and its comments or only its comments. The default is **Content**.
  - **Content**. Show blog post's content and comments.
  - **Description**. Show comments only.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.

- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

BlogRecentPosts

8.50 and higher

The BlogRecentPosts server control displays a list of recent blog post links on a Web form. When you click a link, you are directed to the blog post. The `NumberofPosts` property lets you control how many links appear. Typically, this control appears with other individual Blog server controls.

NOTE: On a PageBuilder page, you can display recent blog posts using the Recent blog posts widget. See also: Creating and Using Widgets

Inserting the BlogRecentPosts server control onto a page

PREREQUISITE

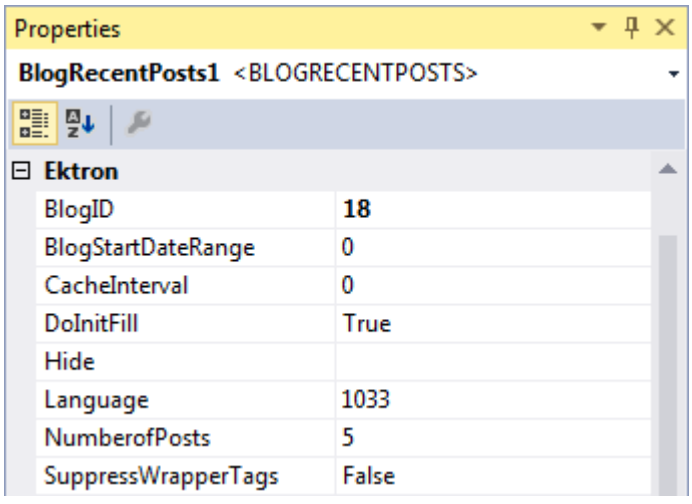
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogRecentPosts** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogRecentPosts ID="BlogRecentPosts1" runat="server" />
```

4. Click on `BlogRecentPosts` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogRecentPosts properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)
  The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147
- **BlogStartDateRange** (String)
  Set the date range of the Blogs to show. For example, want to display blogs for the past 3 months, set to*Quarterly*.
  - **None**. No start date range
  - **Monthly**. Current month
  - **Quarterly. P**ast 3 months
  - **BiYearly**. Past 6 months
  - **Yearly**. Past 12 months
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **NumberofPosts** (Integer)
  Sets the number of post links to display. The default is 5.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

BlogRoll

8.50 and higher

The BlogRoll server control displays a *blog roll* on a Web form. A blog roll is a list of links to other blogs. Typically, this control appears with other individual Blog server controls.

Inserting the BlogRoll server control onto a page

PREREQUISITE

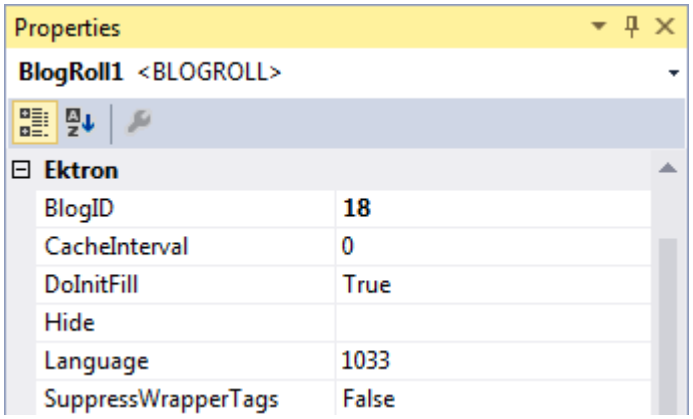
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogRoll** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogRoll ID="BlogRoll1" runat="server" />
```

4. Click on `BlogRoll` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogRoll properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

BlogRSS

8.50 and higher

The BlogRSS server control displays a blog's RSS feed icon ( ) on a Web form. When the icon is clicked, the blog's RSS feed appears. Typically this control appears along side other individual Blog server controls.

Inserting the BlogRSS server control onto a page

PREREQUISITE

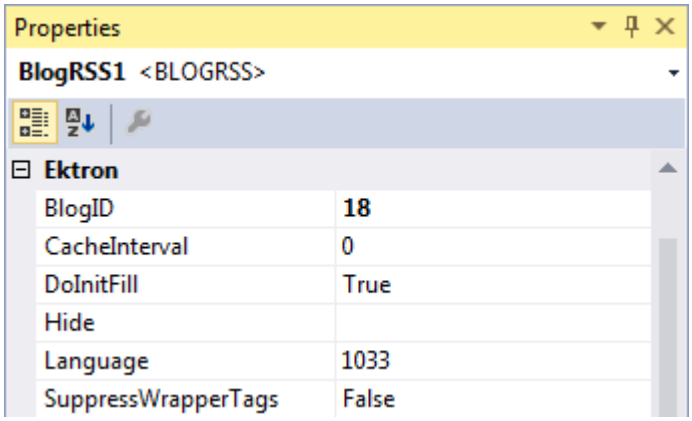
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BlogRSS** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BlogRSS ID="BlogRSS1" runat="server" />
```

4. Click on `BlogRSS` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BlogRSS properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BlogID** (Long)

  The ID of the blog in Ektron. For example: 41. If you don't know the ID of the blog, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

BreadCrumb

8.50 and higher

Your website is made up of Web forms. Each page depends on a form to determine much of its appearance. Forms and pages have a parent > child relationship. That is, a form can be associated with any number of pages. When you define breadcrumb properties, you define them for a *form*. All pages that use a form inherit its breadcrumb properties.

Assume, for example, that a Web form is used for the Human Resources section of your website. You might use the title **Human Resources** to identify the form in the BreadCrumb server control. Whenever a page is visited that uses that form, **Human Resources** appears on the breadcrumb trail -- that is, the form title appears, not the individual page.

Inserting the Breadcrumb server control onto a page

PREREQUISITE

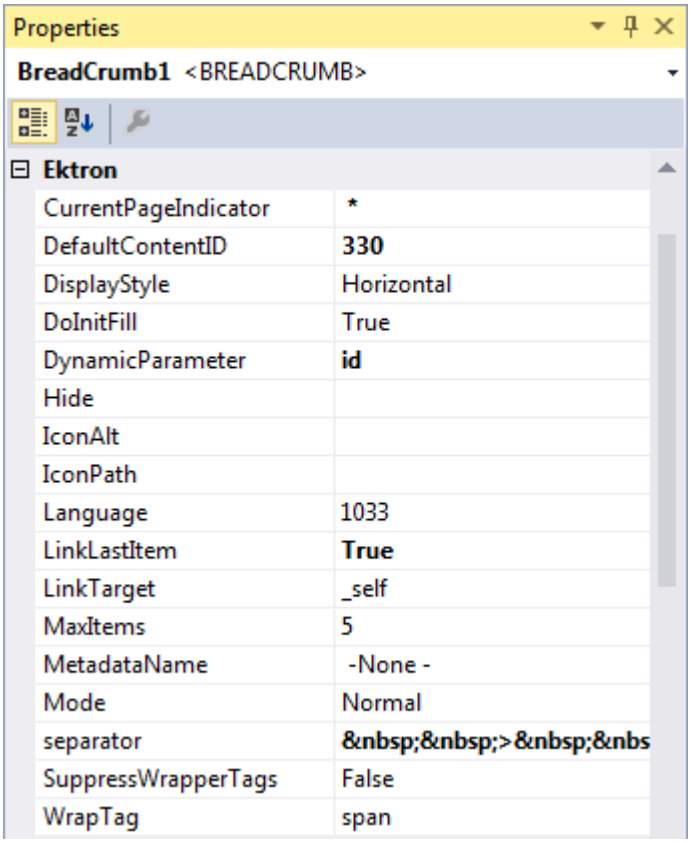
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Breadcrumb** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Breadcrumb ID="Breadcrumb1" runat="server" />
   ```
4. Click on `Breadcrumb` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



BreadCrumb properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CurrentPageIndicator** (String)

  If desired, enter one or more symbols or characters that identify the current page in the breadcrumb trail. See example below.

  These characters appear *after* the image or title that identifies the current page in the breadcrumb trail.

- **DefaultContentID** (Long)

  Gets or Sets the ContentID for the BreadCrumb display title.

- **DisplayStyle** (String)

  Indicate how to display the breadcrumb trail: horizontally or vertically. The default is Horizontal.

- **DisplayTitle** (String)

  IMPORTANT: This property is for code-behind only and does not show up in the Visual Studio Properties window. It cannot be set in design time.

  Enter text to describe this Web form in the breadcrumb trail. For example, if the Web form's properties you are defining is used for all Human Resources pages on your site, enter **Human Resources**.

  If you define an image in the `IconPath` property below, the image appears in the trail, followed by this text.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID dynamically.

- **Hide** (Boolean)

  Used to hide the breadcrumb trail in design time and run time.

  - **True**. Hide breadcrumb trail
  - **False**. Show breadcrumb trail

- **IconAlt** (String)

  If you define an image in the `IconPath` property, enter "Alt" text to appear if a site visitor hovers the cursor over that image. Here is an example.

- **IconPath** (String)

  If you want the breadcrumb trail to display an image to identify this Web form, enter the path to the image. For example: *siteroot*`\Workarea\Images\bc_meta_icon.gif`

  IMPORTANT: The image location must be relative to the Web root.

On the breadcrumb trail, the image precedes any text defined in the `DisplayTitle` property.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkLastItem** (Boolean)

  Use this property to determine whether the last breadcrumb item appears as a hyperlink on this Web form. If this property is set to **True**, and a user clicks the item, the current page reappears.

  - **True**. Last item is a hyperlink
  - **False**. Last item is an image or text only; the user cannot click on it

- **LinkTarget** (String)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MaxItems** (Integer)

  Enter the maximum number of items in the breadcrumb trail on this Web form. The default is **5**. If you set a value of 1 or greater and the user navigates beyond that number of pages, only the most recent pages appear. The older pages disappear from the trail. 0 (zero) = unlimited.

- **MetadataName** (String)

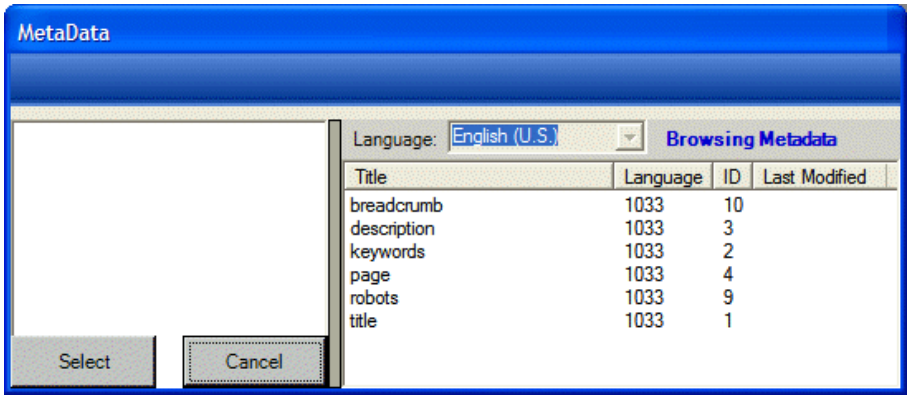
  Specify the name of a Metadata Type that you want to associate with the page.

BreadCrumb metadata type

To associate a metadata type with the BreadCrumb server control:

1. In the properties window for the BreadCrumb server control, click on the **MetadataName** property.
2. Click **Ellipses** ().
3. If you are not logged in, log in using the CMS Explorer window.

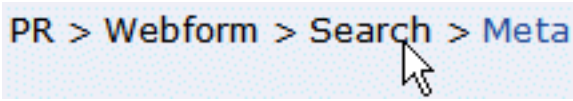
4. The Browsing Metadata screen appears.



5. Select a Metadata Type to apply to the BreadCrumb server control.
6. Set the DynamicParameter to ID. This allows the metadata to reflect the content block on the page.

- **Mode** (String)
  Lets you display the breadcrumb trail as non-hyperlinked, plain text. The default is **Normal**.
  - **Normal**. Breadcrumb trail is hyperlinked

    
  - **DisplayOnly**. Breadcrumb trail is plain text

- **Separator** (String)
  Enter one or more characters to separate breadcrumb trail items on this Web form. The default character is the greater than sign (**>**).

- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
- Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Determining a breadcrumb trail's appearance

For each Web form, you can customize the breadcrumb trail. For example, you might want the breadcrumb trail to appear horizontally on one Web form and vertically on another. The following property list determines the breadcrumb trail's appearance.

- **CurrentPageIndicator**. Symbols or characters to identify the current page.
- **DisplayStyle**. Whether it appears horizontally or vertically.
- **LinkLastItem**. Whether the last item is a hyperlink.
- **LinkTarget**. The type of window that appears when a user clicks an item.
- **MaxItems**. The maximum number of items.
- **Mode**. Whether the breadcrumb trail appears as linked text or plain text.
- **Separator**. Symbols or characters that separate items.

Determining how form pages appear on breadcrumb trail

Use these properties define how any page that uses this form appears within a breadcrumb trail. It does not matter where the trail appears.

Note that you can use text, an image, or both to describe the form within the breadcrumb trail. If you use both, the image appears first, followed by the text. The following property list determines how the Web form appears on a breadcrumb trail.

- **DisplayTitle**. Text to describe it.
- **IconAlt**. "Alt" text associated with image specified in IconPath property.
- **IconPath**. Image to define it.

Creating a horizontal or vertical breadcrumb trail

You can display a breadcrumb trail vertically or horizontally on a Web page with the **DisplayStyle** parameter. In addition, you can define how many breadcrumbs (**MaxItems**) are left for site visitors to navigate back. You can also use an image and Alt text instead of, or in addition to, text to display the breadcrumb trail. The foillowing examples show the variations and are described in *BreadCrumb properties* on page 2197.

NOTE: If a site visitor revisits a page that is in the breadcrumb trail already, the breadcrumb trail reverts back to that point in the trail. For example, if you visit the following pages **Dev > FAQ > WebForm > PR**, and then return to FAQ, the breadcrumb trail looks like this: **Dev > FAQ**.

- Horizontal; text only

  Dev > WebForm > pr > FAQ > Meta*

- Horizontal with images

- Horizontal with images and Alt text

- Vertical; text only

- Vertical with images

- Vertical with images and Alt text

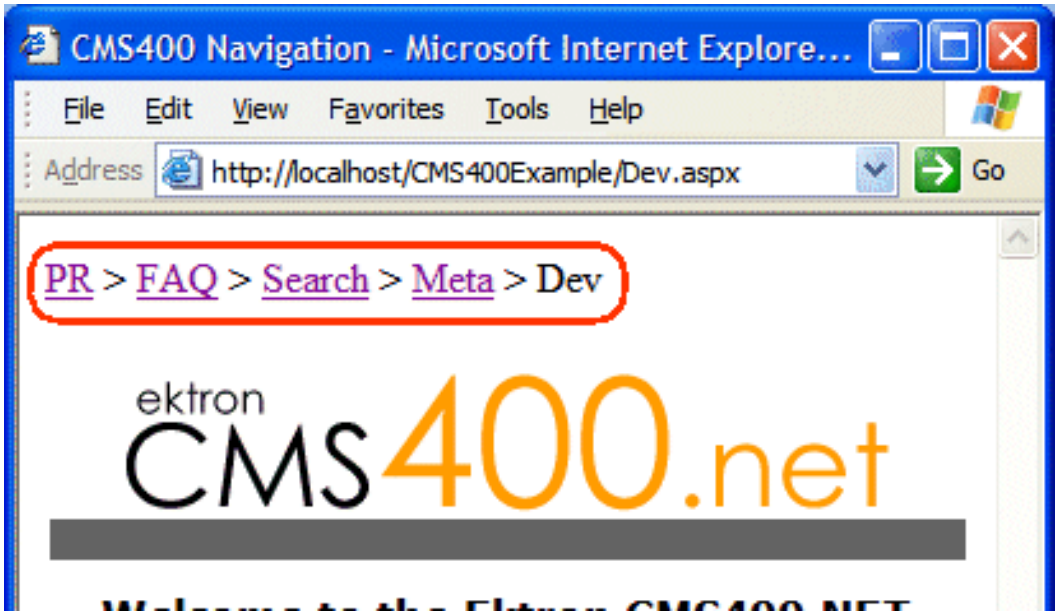
To implement sitemap breadcrumb navigation, add a BreadCrumb server control to every Web form in your site. Doing this ensures that a breadcrumb trail may appear on each Web page.

Using the BreadCrumb server control

NOTE: Do not add a BreadCrumb server control to a Web form that contains a Calendar server control. When both controls appear on a page and a site visitor clicks on different months, the BreadCrumb trail could look like this: Calendar > Calendar > Calendar > Calendar > Calendar. This happens because each time a site visitor clicks on a month, you are in effect opening a new Web form.

Add a BreadCrumb server control to each Web form for which you want to create a breadcrumb trail. To use the BreadCrumb server control:

1. Open a Web form for which you want to create a breadcrumb trail.
2. Drag and drop the BreadCrumb server control onto the Web form.
3. Set the `DisplayTitle` property.
4. Save the Web form.
5. Repeat steps 1 through 4 for all Web forms in the breadcrumb trail.
6. Open a browser.
7. View a Web page with a BreadCrumb server control in it.
8. Navigate to the rest of the Web pages that contain BreadCrumb server controls.
9. As you move around, the pages are added to the breadcrumb trail.



Displaying a content block's title in the breadcrumb trail

By adding a line or 2 of code, the breadcrumb trail can display a content block's title. You can add a line of code to each Web form. Or, if your content is dynamic, add the code once and, each time a new piece of content is called dynamically, a new breadcrumb is created.

You can only use one content block per Web form with the breadcrumb. If a page has multiple content blocks, select one that best describes the page.

1. Drag and drop a **ContentBlock server control** on a Web form.
2. Choose a **DefaultContentID** for the content block.
3. Drag and drop a **BreadCrumb server control** on the same form.
4. Remove the word **Title** from the `DisplayTitle` property.
5. Add the following line of code to the pageload event code-behind:

```
BreadCrumb1.DisplayTitle = ContentBlock1.EkItem.Title
```

6. Build the project.
7. View the Web form in a Web browser.

The following example content block shows titles used as breadcrumbs.

The word Title appears in the breadcrumb trail when the `DisplayTitle` property is left empty. Even with the added code, if the breadcrumb loads before the content block, the breadcrumb has no information in the `DisplayTitle` property and therefore displays the word title by default.

If the word Title appears in the breadcrumb trail, check to make sure the word Title does not appear in the `DisplayTitle` property. Next, if Title still appears, add the following line of code to the page load event of the code-behind:

```
ContentBlock1.Fill()
```

The code in the page load event should now look like this:

```
ContentBlock1.Fill()
BreadCrumb1.DisplayTitle = ContentBlock1.EkItem.Title
```

This ensures that the content block information is loaded first.

BusinessRules

8.50 and higher

The BusinessRules server control lets you add a Business Rule created in the Workarea to a Web form. It also lets you add a place holder for a Business Rule. Then, an Ektron administrator can create a business rule at a later date.

Inserting the BusinessRules server control onto a page

PREREQUISITE

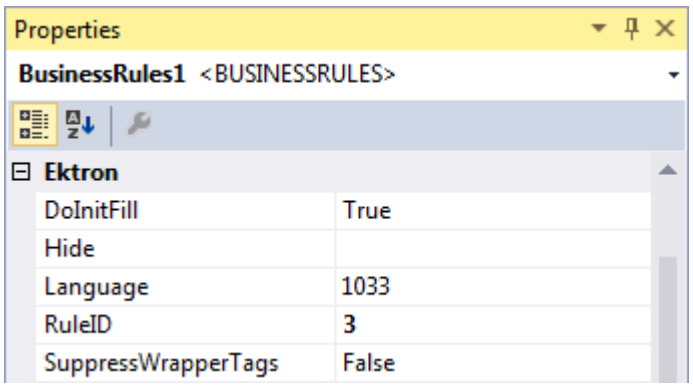
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **BusinessRules** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:BusinessRules ID="BusinessRules1" runat="server" />
```

4. Click on `BusinessRules` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



BusinessRules properties

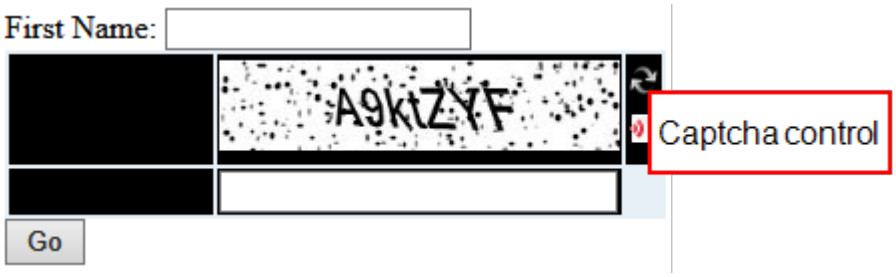
The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **RuleID** (Long)
  The ID of the Ruleset to evaluate. If you don't know the ID number of the Ruleset, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Captcha

9.00 and higher

The Captcha server control lets an Ektron developer place a Captcha control on any web form. The Captcha control is launched when a site visitor clicks the form's submit button. To submit the form, the site visitor must enter characters that match the displayed characters.



The following example shows a `<body>` tag with a Captcha control. In addition to placing the Captcha server control, you must create the form and submit button.

```
<body>
   <form id="form1" runat="server">
      First Name: <asp:TextBox ID="fname" runat="server"></asp:TextBox>
    <div>
    <cms:Captcha ID="captcha1" runat="server" />
    </div>
    <asp:Button Text="Go" ID="button1" runat="server" OnClick="button1_Click" />
    </form>
</body>
```

Inserting the Captcha server control onto a page

PREREQUISITE

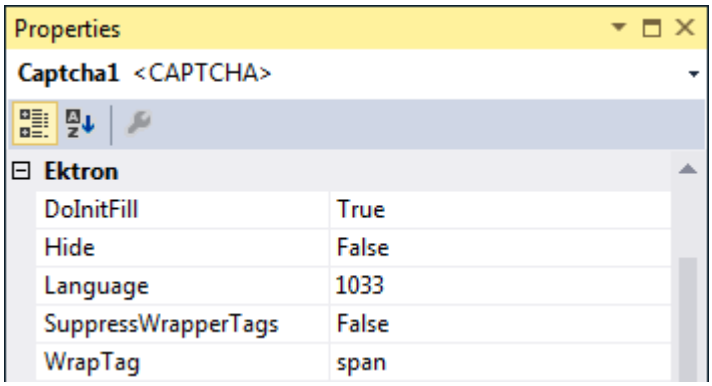
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Captcha** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Captcha ID="Captcha1" runat="server" />
```

4. Click on `Captcha` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Styling the Captcha Control

To style the Captcha control, enter a pair of `<style>` tags into the page's header, as shown below.

```
<head runat="server">
     <title></title>
       <style type="text/css" >
           #captcha1 table td { background-color:black;}
        </style>
</head>
```

Captcha properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Collection

8.50 and higher

IMPORTANT: Starting from release 8.60, the Collection server control was replaced by the FrameworkUI: <ektron:ContentView> templated server control. If you are already using the Collection server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The Collection server control displays a collection that you create in the Workarea. The control lets you customize the display of the collection on a Web page.

When added to a template and visited, collections can look like the following illustration, which shows 3 collections on the same page of a sample site. You can modify the display by editing its properties.

NOTE: On a PageBuilder page, you can insert a collection using the Collection widget. See also: Creating and Using Widgets

Inserting the Collection server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

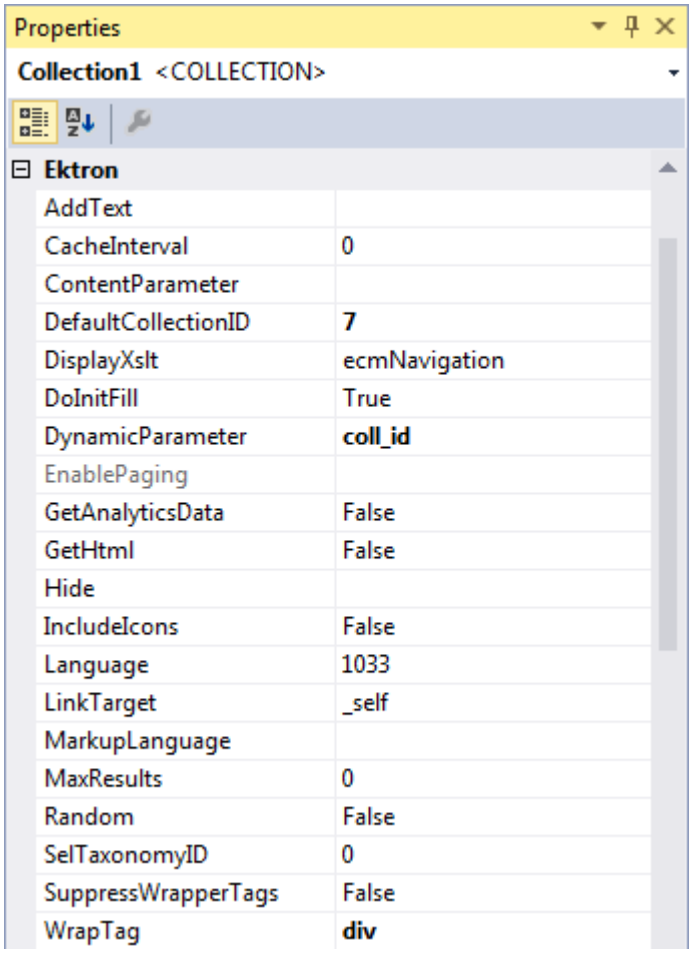
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.

3. Drag the **Collection** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Collection ID="Collection1" runat="server" />
```

4. Click on `Collection` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.

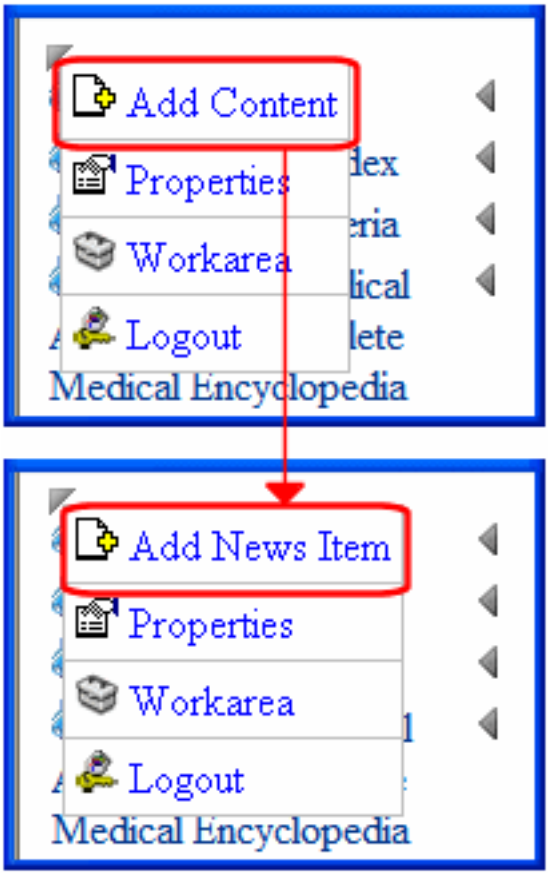


Collection properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddText** (String)

  Override the control's default text for the Add Content menu item. For example, If you have a News website, you could change **Add Content** to **Add News Item**.



- **CacheInterval** (Double)
- The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

  NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **ContentParameter** (String)

  Checks the QueryString for this value and replaces the collection with a content block when specified. Leave blank to always display the Collection.

- **DefaultCollectionID** (Long)

  The ID of a collection that appears where you insert this server control if no other collection is identified, or is not available. If you don't know the ID number of the collection, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DisplayXslt** (String)

  Determines how the information on the page appears.

  - **None**. Databind only
  - **ecmNavigation**. Lists the title of every content block in the collection

- **ecmTeaser**. Lists the title of every content block in the collection plus the content summary

  See also: *ecmTeaser Display example* on page 2215.

- **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

WARNING! If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  To make this collection dynamic, select **coll_id**. When you do, this server control uses the collection passed as a URL parameter.

- **EnablePaging** (Boolean)

  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.See the following example.

  
  For example, if a collection has 9 items and the `MaxResults` property is set to 4, the screen displays only the first 4 items. When the site visitor clicks **[Next]**, he sees items 5, 6, 7 and 8, and so on.

NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **GetAnalyticsData** (Boolean)

Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **GetHtml** (Boolean)

  Set to **True** if you want to retrieve and display content (html body) for all content blocks in the collection. For example, to display content inside a Web server control such as a GridView.

- **Hide** (Boolean)

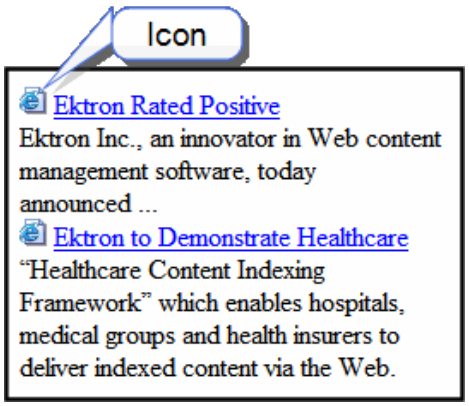
  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeIcons** (Boolean)

  Choose whether to display icons next to the collection list's links.

IMPORTANT: This property only works if ecmSummary or ecmTeaser is used in the `DisplayXslt` property. If the `[$ImageIcon]` variable is used in an EkML file and that file is assigned to the `MarkupLanguage` property, this property acts as True.



- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

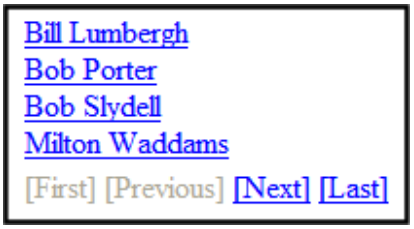
  See also: *Ektron Markup Language* on page 2633

  See also: *collection.ekml* on page 2634

  NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.

- **MaxResults** (Integer)

  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space, enter the maximum number of results per page here. Then, set the **EnablePaging** property to **True**. If you do and more than the number of **MaxResults** are available, navigation aids help the site visitor view additional items. See example below.

- **Random** (Boolean)

  Set to **True** if you want to randomly display one collection item. The item changes each time a site visitor views the page.

  NOTE: If you use a custom XSLT or EkML file, the type of content displayed can be manipulated. For example, if you use an EkML file that has the `[$Html]` variable in it, the actual content appears instead of a link. See also: *Ektron Markup Language* on page 2633 and *[$Html]* on page 2666.

- **SelTaxonomyID** (Integer)

  Set the ID of the taxonomy with which content is associated if a logged-in site visitor uses the Silver Access Point's **Add HTML Content** option to add content to a Collection server control.

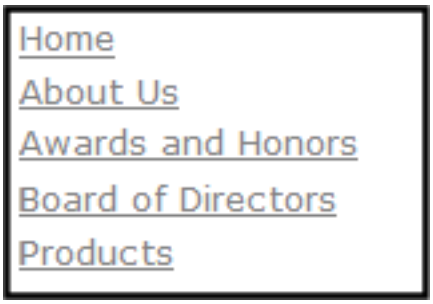
- **SuppressWrapperTags** (Boolean)

  This property is set to `false` because Ajax uses `<div>` tags to rewrite the region around the tag. You *cannot* change the value to `true`.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

ecmNavigation Display Example

The following figure shows a collection being used as a navigation menu.



ecmNavigation XSL code

The following XSL code creates the ecmNavigation Display. You can use this code as the basis to design your own XSLT.

WARNING! If you create a custom file, do not store it in the Workarea folder. If you do, the file will be overwritten when you upgrade.

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
  <table border="0" cellspacing="0" cellpadding="0" width="100%">
   <xsl:for-each select="Collection/Content">
   <tr>
      <td>
         <a>
            <xsl:attribute name="href">
                <xsl:value-of select="QuickLink"/>
            </xsl:attribute>
                <xsl:value-of select="Title"/>
         </a>
     </td>
   </tr>
   </xsl:for-each>
  </table>
</xsl:template>
</xsl:stylesheet>
```

ecmTeaser Display example

The following example shows a collection using the ecmTeaser display style.

ecmTeaser XSL code

The following XSL code creates the ecmTeaser Display. You can use this code as the basis to design your own XSLT.

WARNING! If you create a custom file, it is strongly recommended to not store the file in the Workarea folder. If you do, the file will be overwritten when you upgrade.

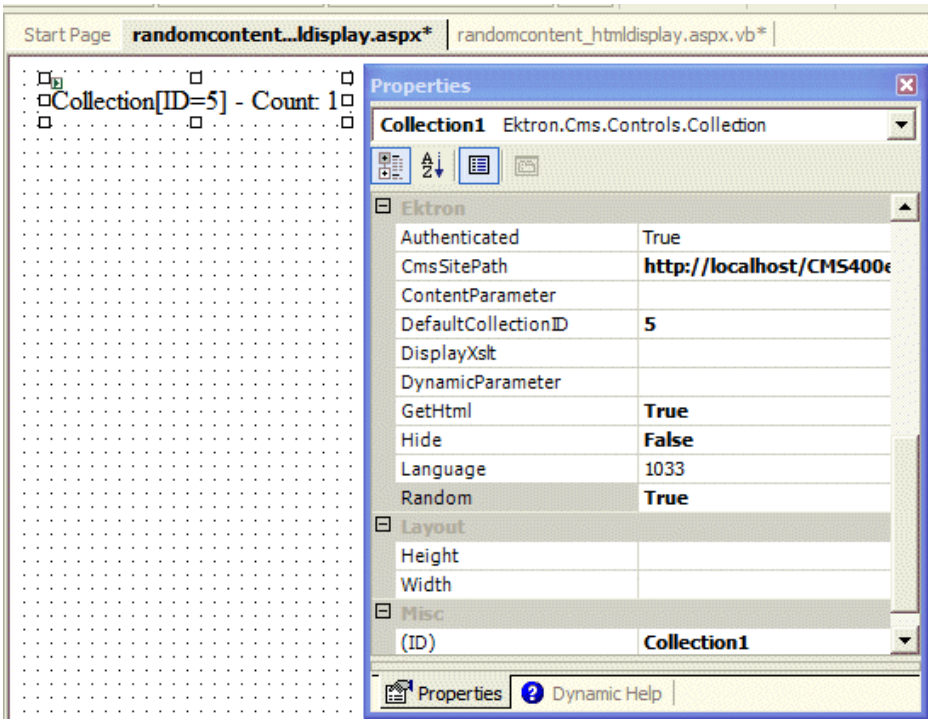
```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
  <table border="0" cellspacing="0" cellpadding="0" width="100%">
    <xsl:for-each select="Collection/Content">
      <tr>
        <td>
          <a>
            <xsl:attribute name="href">
              <xsl:value-of select="QuickLink"/>
              </xsl:attribute>
             <xsl:value-of select="Title"/>
          </a> 
        </td>
      </tr>
      <tr>
         <td>
            <xsl:value-of select="Teaser" />
         </td>
      </tr>
      <tr>
          <td> </td>
      </tr>
    </xsl:for-each>
  </table>
</xsl:template></xsl:stylesheet>
```

Using the Collection server control Programmatically example

The following is an example of using code-behind, and a drag and drop Collection server control to display random content from a collection.

1. Drag and drop a Collection server control on your Web form.
2. Set the properties in the properties window.

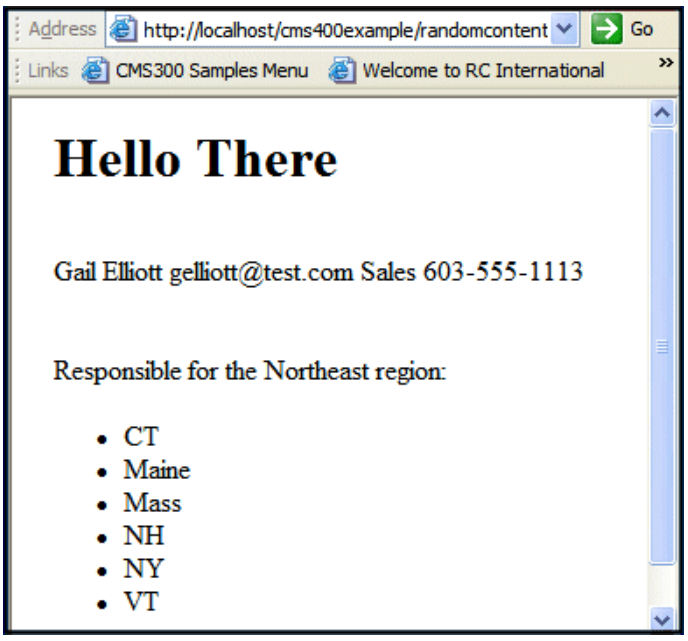
NOTE: In this example, the `Random` and `GetHtml` properties must be set to **True**.



3. Add the following code to the code-behind.

```
Dim str As String
str = "<h1>Hello There</h1><br>"
str &= Collection1.EkItems(0).Html
Collection1.Text = str
```

4. Build and browse your Web form.



Retrieving the XML Structure of a Collection

Retrieving the XML structure of a collection allows for greater control over developing XSLs. The following is an example of how to do that.

1. Open a new Web form.
2. Drag and drop a Collection server control onto it.
3. Set the `DefaultCollectionID` property.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to MultiLine.

   NOTE: Set the text box width to at least 400px.

6. On the code-behind page, add the following line.

   ```
   Textbox1.Text = Collection1.XmlDoc.InnerXml
   ```

7. Build the project.
8. View the Web form in a browser.
9. The XML structure of the collection appears in the textbox.

For an additional example, see the Collection XML page on the Developer samples page. It is located at:

- In a browser:

  ```
  http://sitroot/CMS400Developer/Developer/Collection/CollectionXML.aspx
  ```

- In the source code:

  ```
  siteroot/CMS400Developer/Developer/Collection/CollectionXML.aspx
    and CollectionXML.aspx.vb
  ```

Community server controls

8.50 and higher

The Community server controls are as follows:

- *ActivityStream* on the facing page
- *CommunityDocuments* on page 2223
- *CommunityGroupBrowser* on page 2233
- *CommunityGroupList* on page 2237
- *CommunityGroupMembers* on page 2243
- *CommunityGroupProfile* on page 2247
- *ContentFlagging* on page 2251
- *Favorites* on page 2254
- *Friends* on page 2260
- *Invite* on page 2267
- *MessageBoard* on page 2270

ActivityStream

8.50 and higher

The ActivityStream server control displays notification messages generated by Ektron's Notification system. See also: Notifications

When this control is added to a Web page, Ektron looks for a `DefaultObjectID` defined in properties. If one is found, the activity stream is based on that user or group. If none is found, notifications are based on the pages's dynamic query string parameter, which typically identifies the logged-in user.

You can exclude any user or a group from the activity stream. To achieve this, open the page that hosts the Activity Stream server control, find the control, and add the following to the control's code-behind.

```
//activityStream
cmsActivityStream.ExcludeUserIds.Add(this.ProfileId);
You can also exclude groups.
cmsActivityStream.ExcludeGroupIds.Add(GroupId1);
cmsActivityStream.ExcludeGroupIds.Add(GroupId2);
:
cmsActivityStream.ExcludeGroupIds.Add(GroupIdN);
```

To add this control to a page, drop it on a Web form and set the following properties.

- **DefaultObjectID**. If you want a user's or community group's activity stream to appear in the control, enter that ID.
- **DefaultObjectParameter**. Enter the default object parameter used on the QueryString to define an object's ID. For example, if you are passing the ID value of a community group, you might enter 'gid' for this property. So, if you pass `http://~yoursite~/CGHome.aspx?gid=21` in the query string to a page containing this control, you see the activity stream for the community group whose ID is 21.
- **ObjectType**. Select the whether the control is associated with a user or Community Group
- **TemplateUserProfile** and **ProfileParamName**. If you want a user's avatar in the activity stream to be a clickable link that leads to the user's profile page, set these properties.

Inserting the ActivityStream server control onto a page

PREREQUISITE

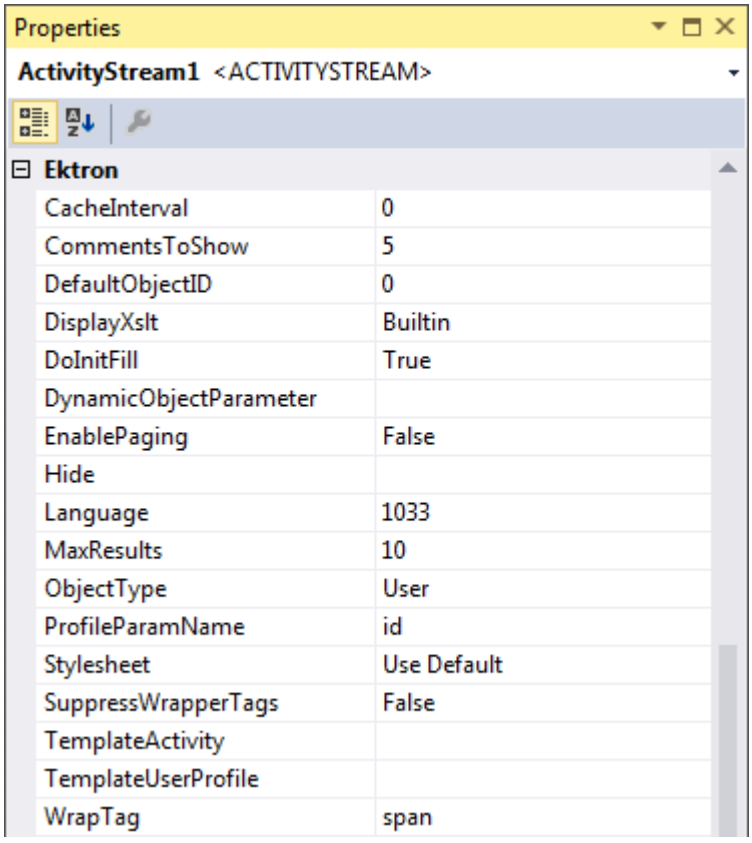
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ActivityStream** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:ActivityStream ID="ActivityStream1" runat="server" />
```

4. Click on `ActivityStream` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ActivityStream properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual

Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultObjectID** (Long)

  The ID of the object whose activity stream will appear where you place this server control. For example, if you want this control to display Scott Markey's activities, and his USER ID is 142, place **142** here, and set the `ObjectType` property to **User**. To display the activity stream for the logged-in user, enter zero (**0**).

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicObjectParameter** (String)

  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank. For example, if you are passing the ID value of a community group, you might enter 'gid' for this property. So, if you passed `http://~yoursite~/CGHome.aspx?gid=21` on the Query Strings to a page containing this control, you would see the activity stream for the group with an ID of 21.

- **EnablePaging** (Boolean)

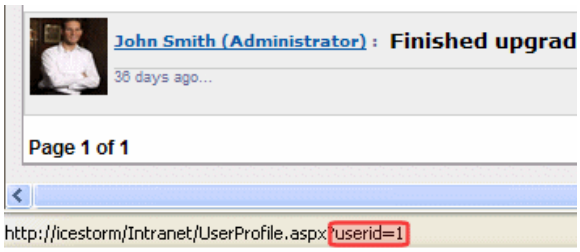
  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.

- **Hide** (Boolean)

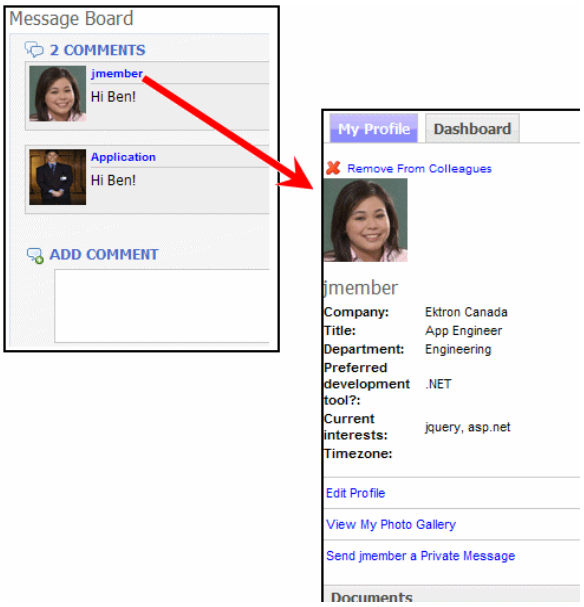
  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MaxResults** (Integer)
  The Maximum number of notifications to fetch. 0 (zero) = unlimited.
- **ObjectType** (ActivityFeedType)
  The type of object to which this control is assigned. Choices are:
  - **User**. Control is assigned to an individual
  - **Group**. Control is assigned to a community group
- **ProfileParamName** (String)
  The parameter name to pass in the QueryString to the TemplateUserProfile page, if you want it to be anything other than id. For example, you may prefer `userid`, because it is more descriptive, as shown in the following example.



- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateActivity** (String)
  The URL path to a page that contains another ActivityStream server control. When this property contains a path and the destination page has an ActivityStream control whose `ObjectType` property is set to `Activity`, a user can click an Activity Stream's time span on the first page to open a second page that contains just that activity. See also: *Viewing a customer orders list* on page 2394.
- **TemplateUserProfile** (String)
  The URL path to a page that contains the UserProfile server control. The path can be relative or absolute. If you enter a path, a user can click a user's name or avatar from the Message Board server control and be forwarded to the profile page. See illustration.



User templates can be defined in the Ektron **Workarea > Settings > Community Management > Templates** screen. However, if you assign a template in this field, this setting takes precedence over the setting on the Workarea Template screen.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

CommunityDocuments

8.50 and higher

The CommunityDocuments server control displays a list of uploaded content filtered by category. In addition, a logged-in member can manage files, create categories, and decide which users can view the documents. This server control is typically placed on a user's or a group profile page.

NOTE: When you drag and drop this control on a Web form in Visual Studio, the following message appears in the label of the control: "Workspace for user does not exist". This happens because no ID is assigned to the control. When you assign an ID, the control's name and the ID are displayed. If you use the `DynamicParameter` property to dynamically pass an ID from the QueryString, the above message appears because an ID is not assigned to the control.

Inserting the CommunityDocuments server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

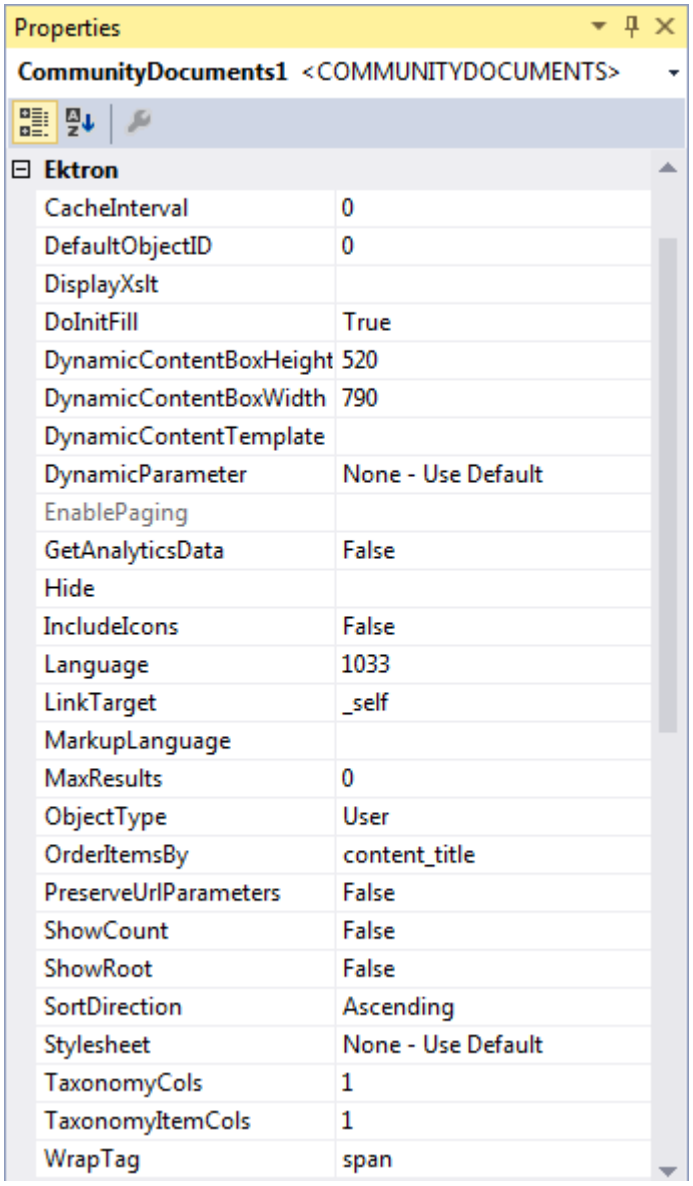
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CommunityDocuments** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:CommunityDocuments ID="CommunityDocuments1" runat="server" />
   ```

4. Click on `CommunityDocuments` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



CommunityDocuments properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultObjectID** (Long)

  The default object ID for this control to use when there is no matching dynamic parameter value passed.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicContentBoxHeight** (Integer)

  The height of the dynamic content box in pixels.

- **DynamicContentBoxWidth** (Integer)

  The Width of the dynamic content box in pixels.

- **DynamicContentTemplate** (String)

  The template to use when displaying dynamic content. Leave blank to use the dynamic box.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank.

- **EnablePaging** (Boolean)

  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.

- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **Hide** (Boolean)

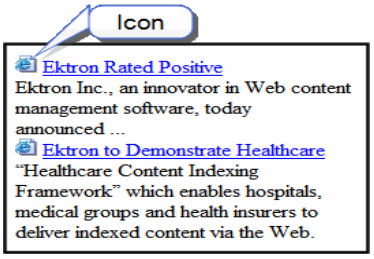
  Hides or displays the output of the control in design time and run time.

- **True**. Hide the control output.
- **False**. Display the control output.

- **IncludeIcons** (Boolean)

  Choose whether to display icons next to the navigation list's links.

  - **True**. Show icons
  - **False**. Hide icons



- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (String)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

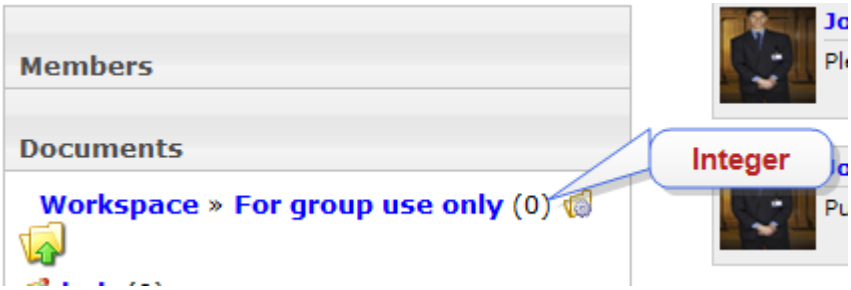
  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633

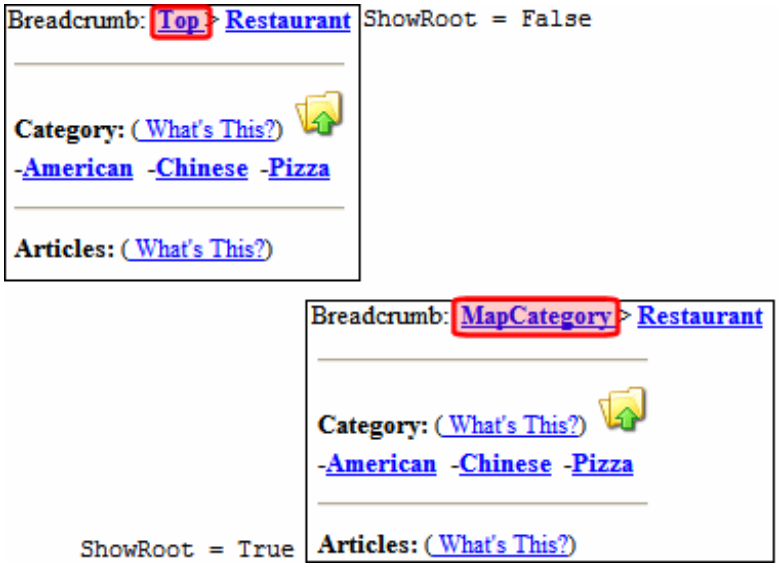
- **MaxResults** (Integer)

  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space, enter the maximum number of results per page here. Then, set the **EnablePaging** property to **True**. If you do and more than the number of **MaxResults** are available, navigation aids help the site visitor view additional items.

- **ObjectType** (CommunityDocumentsObjectType)
  The type of object to which this control is assigned. Choices are:
  - **User**. Control assigned to an individual
  - **Group**. Control assigned to a community group
- **ShowCount** (Boolean)
  Determines if an integer representing the number of items in a category appears next to the category.
  - **True**. Show number next to category
  - **False** (default). Do not show number next to category



- **ShowRoot** (Boolean)
  - **False. Top** represents the first node of the taxonomy path.
  - **True**. The *name* of the taxonomy path's first node appears instead of **Top**.



- **SortDirection** (String)
  Select the direction of the `itemSortOrder` property. Choose **Ascending** or **Descending**.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder

outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **TaxonomyCols** (Integer)
  Enter the number of columns in which this taxonomy/category appear on the page.
- **TaxonomyItemCols** (Integer)
  Enter the number of columns in which the taxonomy item appears on the page.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Using CommunityDocuments with an individual user profile

Part of the Community Platform, this server control lets users create and upload individual user content to the user profile. The content can be HTML content or an asset, such as a .PDF document or a .jpeg file.

Adding folders to your workspace

1. On the website, navigate to a **User's Profile Page** > **Workspace**.
2. Click **Manage Folder** (). The Add Folder box appears.
3. Enter a **Name** for the folder.
4. Determine with whom you want to share the folder's documents. For a description of the **Share** options, see *Sharing workspace content* on page 2231.
5. Click **Add**. The page refreshes and displays the newly added folder.

Editing a folder name in your workspace

1. On the website, navigate to a **User's Profile Page** > **Workspace**.
2. Click **Edit** (), located to the left of the folder's title. The Edit Folder dialog appears.
3. Change the name of the folder.
4. Click **Save**. The page refreshes and shows the folder's new name.

Deleting a folder from your workspace

NOTE: You can not delete the top-level folder, Workspace.

WARNING! Deleting a folder permanently deletes the assets and HTML content in the folder, and its subfolders.

1. On the website, navigate to a **User's Profile Page** > **Workspace**.
2. Click **Edit** (), located to the left of the folder's title. The Edit Folder dialog appears.
3. Click **Delete**. A dialog box asks you to confirm.
4. Click **OK**.

Adding assets to a workspace

Assets are files that are not HTML content, such as an Office document or PDF.

1. On the website, navigate to a **User's Profile Page** > **Workspace**.
2. Select a folder to which the asset will be added. If you want to create a new folder, see *Adding folders to your workspace* on the previous page
3. Click **Add Asset** (). The Add Asset box appears. Its appearance varies depending on your browser, and so on. To learn about these variations, see Methods for Importing Assets.
4. Import one or more assets, depending on the screen. A status box shows the files being uploaded and then the asset(s) appear in the file list.

Creating HTML content in your workspace

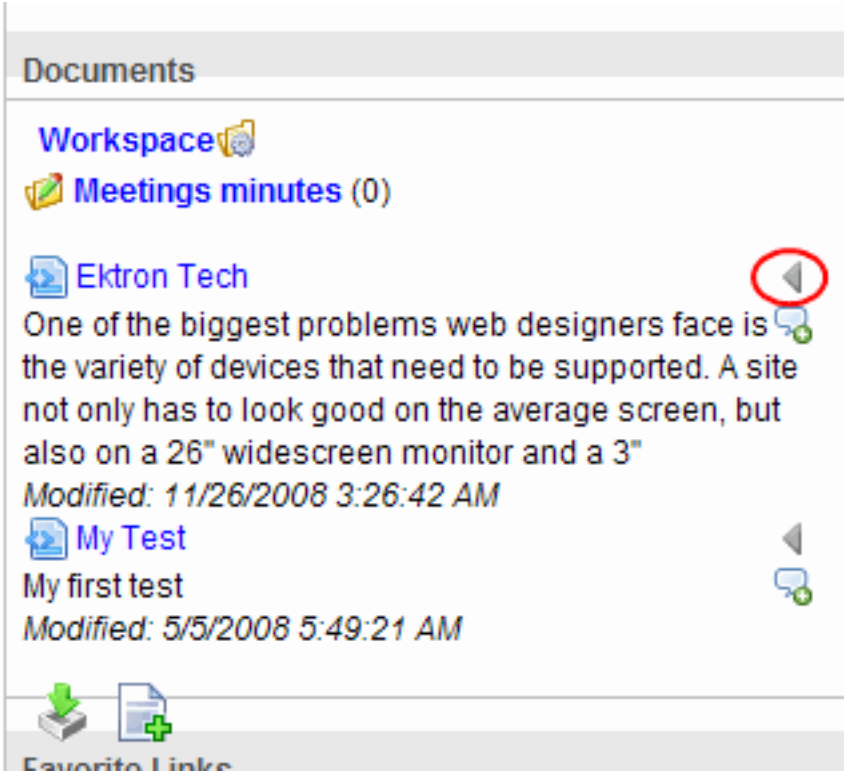
1. On the website, navigate to a **User's Profile Page > Workspace**.
2. Select a folder where the content will be added. If you want to create a new folder, see *Adding folders to your workspace* on the previous page
3. Click **Add HTML Content** (). The Add HTML Content window appears.
4. Add a title and content.
5. Click **Publish** to publish the content.
6. The HTML content appears in the file list.

Moving and copying content in your workspace

You can move or copy assets and HTML content from one folder to another. To accomplish either action:

1. On the website, navigate to a **User's Profile Page** > **Workspace**.
2. Select the folder from which to move or copy the content.

3. Click the drop-down triangle to the right of the content title.



4. From the drop-down list, select **Copy**.
5. Select the folder to which the content will be moved.
6. Click **Manage**.
7. Click **Move Items** ( ) or **Copy** ( ). A dialog box asks you to confirm.
8. Click **OK**. The moved or copied content appears in the folder.

Sharing workspace content

The Workspace area allows users to share content with colleagues. Users can share content with the Public, Colleagues, Selected Colleagues or keep the content private.

Users apply sharing options to *folders*, not individual content items. To share a folder:

1. On the website, navigate to a user's or community group's **Profile Page > Workspace**.
2. Locate the folder you want to share.
3. Click **Manage Folder** ( ). The Add or Share Folder dialog box appears.
4. Click **Share Folder** ( ) in the top right corner. The Share Folder dialog box appears.
5. Select with whom to share your folders.
   - **Public**. Everyone viewing your Workspace
   - **Colleagues**. Only colleagues. See also: *Friends* on page 2260 server control

- **Selected Colleagues**. Only selected colleagues See also: *Designating a selected colleague* on page 2266.
- **Private**. Only you

6. Click **Share**.

Documents in the folder are now available for viewing by the selected viewer type.

Using CommunityDocuments with a group profile

Part of the Community Platform, this server control lets users create and upload group content to the group profile. The content can be HTML content or an asset, such as a .PDF document or a .jpeg file.

Adding folders to the group workspace

Community group members can add folders to the Workspace to help organize items in the **Documents** area.

1. On the website, navigate to a community group's **Profile Page > Workspace**.
2. Click **Manage Folder** (). The Add Folder dialog appears.
3. Enter a **Name** for the folder.
4. Determine with whom you want to share the folder's documents.
   - **Public**. Anyone can view and edit the document
   - **Private**. Only group members can view and edit the document

   NOTE: If you want to later change a folder's share setting, follow the directions in *Sharing workspace content* on the previous page.

5. Click **Add**. The page refreshes and displays the newly added folder.

Editing a folder name in a group workspace

1. On the website, navigate to a community group **Profile Page > Workspace**.
2. Click **Edit** (), located to the left of the folder's title. The Edit Folder dialog appears.
3. Change the name of the folder.
4. Click **Save**. The page refreshes and shows the folder's new name.

Deleting a folder from a group workspace

NOTE: You can not delete the top-level folder, Workspace.

WARNING! Deleting a folder permanently deletes all of the assets and HTML content in the folder, as well as its subfolders.

1. On the website, navigate to a community group's **Profile Page > Workspace**.
2. Click **Edit** (), located to the left of the folder's title. The Edit Folder dialog appears.
3. Click **Delete**. A dialog box asks you to confirm.
4. Click **OK**.

CommunityGroupBrowser

8.50 and higher

The CommunityGroupBrowser server control allows a user to browse a taxonomy structure for community groups. As the user browses, community groups at each level appear in a results box.

In addition, a user can click **Create Group** to create a new group. When the group is created, it is automatically added to the taxonomy you are viewing.

Inserting the CommunityGroupBrowser server control onto a page

PREREQUISITE

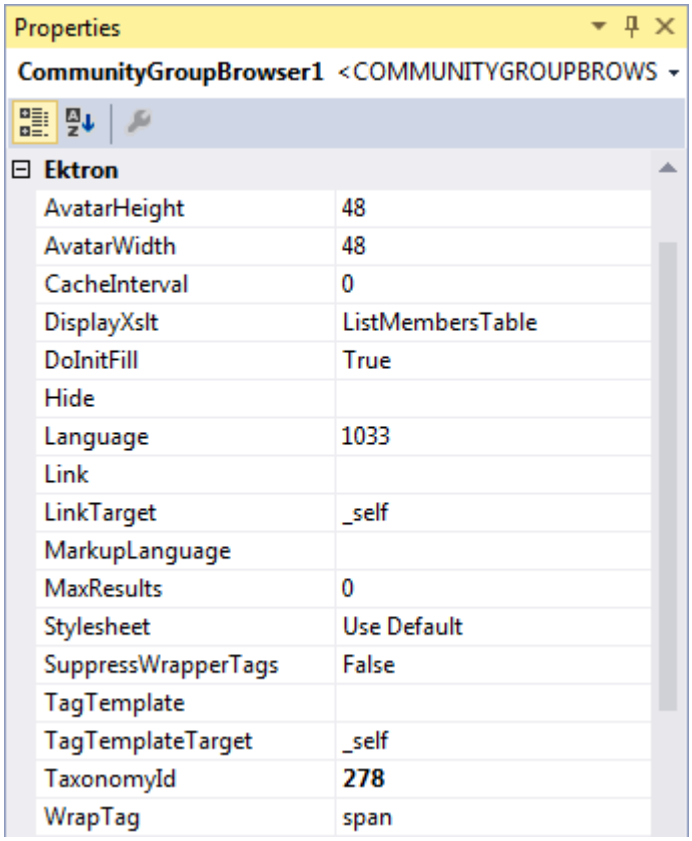
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CommunityGroupBrowser** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:CommunityGroupBrowser ID="CommunityGroupBrowser1" runat="server" />
```

4. Click on `CommunityGroupBrowser` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



CommunityGroupBrowser properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AvatarHeight** (Integer)

  The display height of the avatar in the results box.

- **AvatarWidth** (Integer)

  The display width of the avatar in the results box.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! If you enter a valid EkML file at the `MarkupLanguage` property, the `DisplayXslt` property value is ignored.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Link** (String)

  Add a link to the group's profile page. This allows a user to click a link in the community group list and be taken to the group's profile page. There are 2 variables used within the link that represent the group ID and the group name.

  - **{0}**. Represents the group's ID.
  - **{1}**. Represents the group's name.

  You need to have both variables in the link. The Web form can be relative or absolute. Below is an example.

  ```
  groupprofilepage.aspx?gid={0}&gn={1}
  ```

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633

- **MaxResults** (Integer)
  The Maximum number of items to fetch. 0 (zero) = unlimited.

- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TagTemplate** (String)
  Add a path to another Web form to create links for the tag text. The path can be relative or absolute. By providing the path to CommunitySearch server control, a user viewing the list of groups can click a tag and search for other groups with the same tag. There are 5 parameters that are automatically added to the link's QueryString that let you pass information about tag.
  - **searchgrptag**. The tag's text for community groups.
  - **TagId**. The tag's ID.
  - **TagLanguage**. The tag's language.
  - **TagCount**. The tag's count (the number of times a tag has been used.)
  - **TagType**. The tag's type: user or community group.

  In addition to these parameters, you can add your own by defining them in the path. If you do, these parameters are appended to yours. See also: Tagging Content, Library Items, Users, and Groups with Keywords.

- **TagTemplateTarget** (String)
  Determines the type of window that appears when you click a link in the server control.

- **_Self** (default). Opens in same window.
- **_Top**. Opens in parent window.
- **_Blank**. Opens in new window.
- **_Parent**. Opens in the parent frame.

- **TaxonomyId** (Long)
  Enter the ID number of the taxonomy or category to appear in this server control. If you don't know the number, click the button and navigate to the taxonomy or category. When you select one, it appears in the center of the Visual Studio window.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

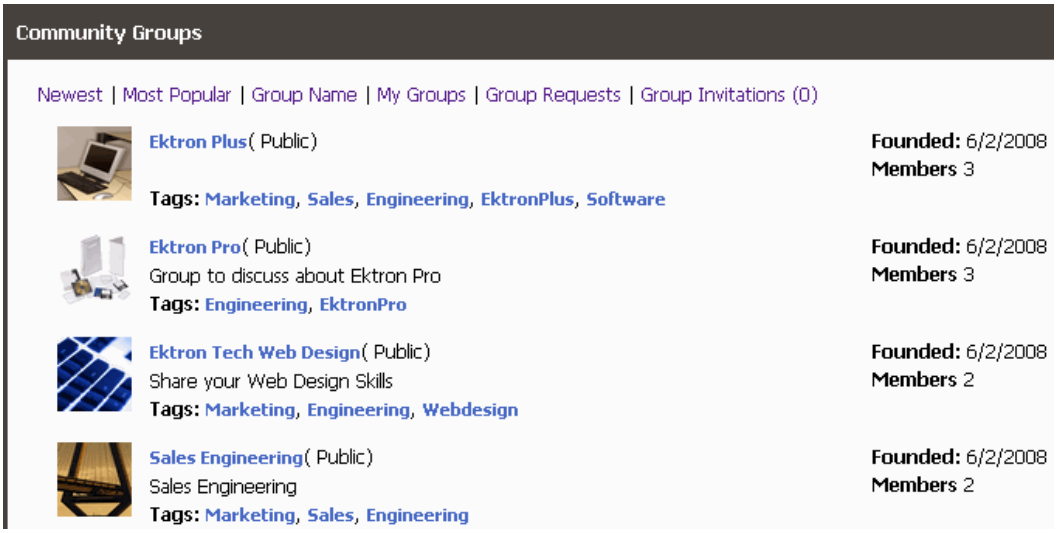
CommunityGroupList

8.50 and higher

The CommunityGroupList server control, part of Ektron's Community Platform, displays a list of community groups. It can be configured to sort groups by name, newest, or most popular.

When associated with a user, this control can show

- community groups with which a user is associated
- community groups the user has been invited to join
- community groups for which the user's request to join is pending



CommunityGroupList server control displays the following information about each community group.

- **Community Group Avatar**. An image representing the group.
- **Community Group Name**. The name of a community group.
- **Type**. Whether the community group is Public or Restricted.
- **Short Description**. The community group's description, as entered in the Short Description field of the group's properties.
- **Tags**. Tags associated with the community group.
- **Founded**. When the community group was created.
- **Members**. The number of users in the community group.

Inserting the CommunityGroupList server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

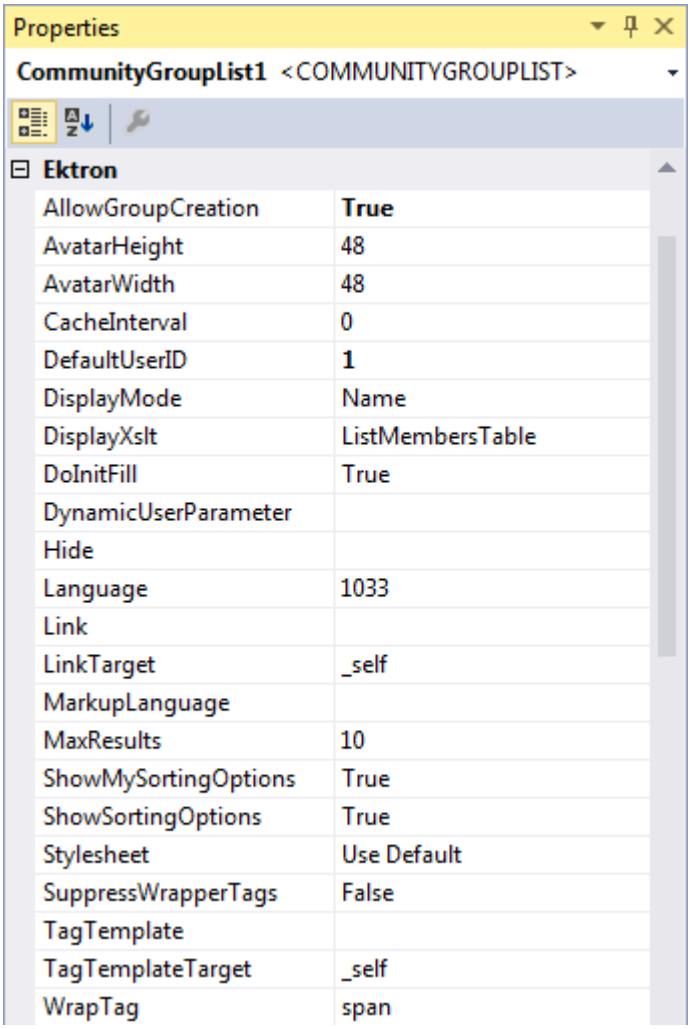
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CommunityGroupList** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:CommunityGroupList ID="CommunityGroupList1" runat="server" />
   ```

4. Click on `CommunityGroupList` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



CommunityGroupList properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AllowGroupCreation** (Boolean)

  If the user has permission to create community groups and this property is set to True, the Create Groups link appears in the control.

  - **True**. Create Group link appears on the control.
  - **False**. Create Group link is hidden on the control.
- **AvatarHeight** (Integer)

  The display height (in pixels) of the avatar in the results box.
- **AvatarWidth** (Integer)

  The display width (in pixels) of the avatar in the results box.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultUserID** (Long)

  The default User ID for this control to use if no matching dynamic parameter value is passed.

- **DisplayMode** (eDisplayMode)

  Select the way this control initially displays community group information. Choices are:

  - **Newest**. Newly added community groups.
  - **MostPopular**. Community groups with the most members.
  - **Name**. Community groups sorted alphabetically by name
  - **MyGroups**. Community groups to which the logged-in user belongs
  - **MyPendingGroups**. Community groups to which the logged-in user has asked to join, but has not yet been accepted

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicUserParameter** (String)

  Gets or sets the QueryString parameter to read a user ID dynamically. To use the default user ID, leave blank.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **Link** (String)
  Add a link to the group's profile page. This allows a user to click a link in the community group list and be taken to the group's profile page. The link includes these 2 variables.
  - **{0}**. Group ID
  - **{1}**. Group name

  The link requires both variables. The Web form can be relative or absolute. Below is an example.

  ```
  groupprofilepage.aspx?gid={0}&gn={1}
  ```
- **LinkTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633
- **MaxResults** (Integer)
  The Maximum number of items to fetch. 0 (zero) = unlimited.
- **ShowMySortingOptions** (Boolean)
  If this control is associated with a user and this property is set to True, the controls displays the following sorting options:
  - **My Groups**. A list of community groups to which the user belongs.
  - **Group Requests**. A list of community groups to which a user has requested to join, but has yet to be accepted.
  - **Group Invitations**. A list of community group that the user has been invited to join, but has yet to accept.

When set to False, **Leave Selected Group** is the only option that appears.

Depending on how the `DisplayMode` property is set, you may see additional sorting options.

- **ShowSortingOptions** (Boolean)
  If this control is used to display a general list of community groups and this property is set to `True`, the following sorting options appear.
  - **Newest**. Recently added community groups
  - **Most Popular**. Community groups with the most members.
  - **Group Name**. Community groups sorted alphabetically
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TagTemplate** (String)
  Add a path to another Web form to create links for the tag text. The path can be relative or absolute. By providing the path to CommunitySearch server control, a user viewing the list of groups can click a tag and search for other groups with the same tag. There are 5 parameters that are automatically added to the link's QueryString that let you pass information about tag.
  - **searchgrptag**. The tag's text for community groups.
  - **TagId**. The tag's ID.
  - **TagLanguage**. The tag's language.
  - **TagCount**. The tag's count. The tag's count is the amount of times a tag has been used.
  - **TagType**. The tag's type. The tag's type will be user or community group.

  In addition to these parameters, you can add your own by defining them in the path. When you do, these parameters will be appended to your parameters.
- **TagTemplateTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.

- **_Blank**. Opens in new window.
- **_Parent**. Opens in the parent frame.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

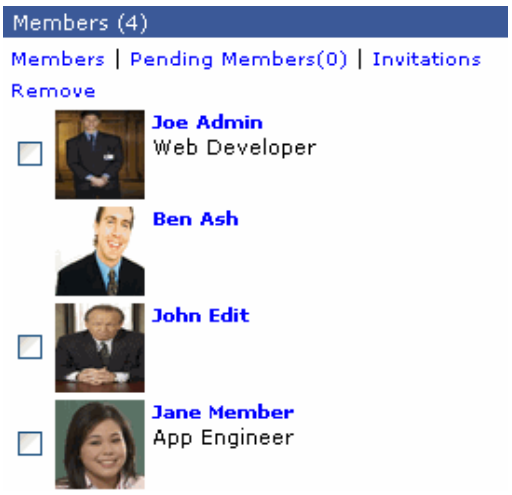
CommunityGroupMembers

8.50 and higher

The CommunityGroupMembers server control allows you display a list of members

- in a community group
- pending approval to join the group
- invited to join the group

In addition, if a logged-in user is the community group's administrator, assigned the Community Group Administrator role, or a site administrator, the user can approve pending members, remove members, and cancel invitations.



The following links appear on the CommunityGroupMembers server control when a community group's administrator or Ektron administrator is logged in and viewing the control.

- **Members**. Current members.
- **Pending Members**. Members who have asked to join the group, but have yet to be accepted. This link is used when access to the community group is restricted.
- **Invitations**. Members who were invited to join the group but have not accepted. This link is used when access to the community group is restricted.
- **Remove**. Removes member from community group.

Inserting the CommunityGroupMembers server control onto a page

PREREQUISITE

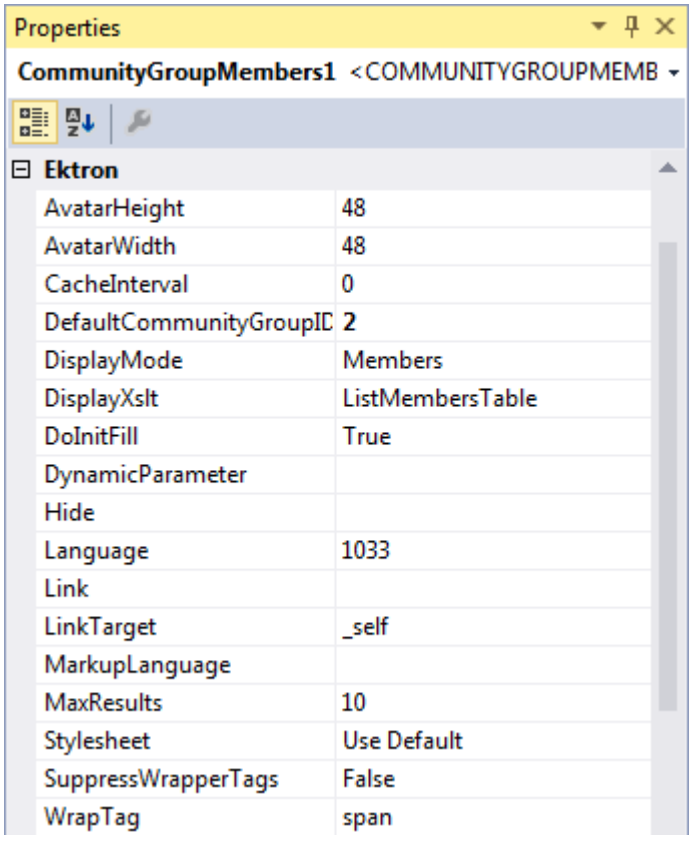
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CommunityGroupMembers** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:CommunityGroupMembers ID="CommunityGroupMembers1" runat="server" />
```

4. Click on `CommunityGroupMembers` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



CommunityGroupMembers properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual

Studio® help.

- **AvatarHeight** (Integer)
  The display height (in pixels) of the avatar in the results box.
- **AvatarWidth** (Integer)
  The display width (in pixels) of the avatar in the results box.
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DefaultCommunityGroupID** (Long)
  The default community group ID for this control to use if no matching dynamic parameter value is passed.
- **DisplayMode** (eDisplayMode)
  Select whether this control displays a community group's current members or their pending members. Choices are:
  - **Members**. Current group members
  - **PendingMembers**. Users who asked or were invited to join the group
- **DisplayXslt** (String)
  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING! If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Gets or sets the QueryString parameter to read a community group ID dynamically. To use the default community group ID, leave blank.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **Link** (String)
  Add a link to the member profile page's Web form. This allows a user to click a link in the community group members list and be taken to a member's profile page. Two 2 variables used within the link represent the user's ID and name.
  - **{0}**. User ID
  - **{1}**. User name

  The link needs both variables. The Web form can be relative or absolute. For example:

  ```
  userprofilepage.aspx?gid={0}&gn={1}
  ```
- **LinkTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633
- **MaxResults** (Integer)
  The maximum number of items to fetch. 0 (zero) = unlimited.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

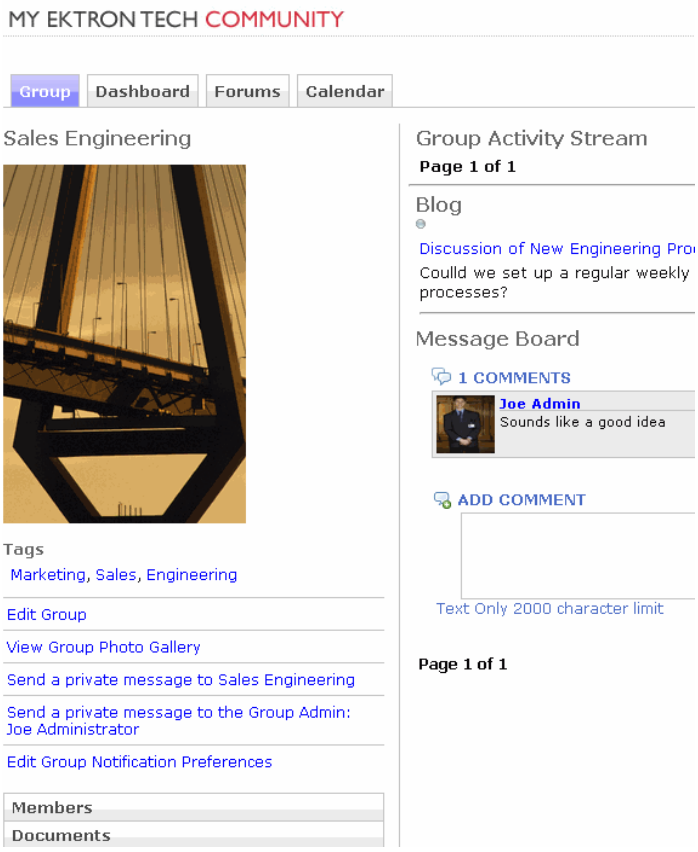
CommunityGroupProfile

8.50 and higher

The CommunityGroupProfile server control displays the profile of a community group. You can see an example of the CommunityGroupProfile server control in the **Ektron Tech** site **> Community > Community Groups >** select any group. The profile includes:

- an image associated with the group
- a description of the group
- tags assigned to the group
- whether the group is Public or Restricted
- the date the group was founded
- location information
- group members
- group administrator

- an **Edit** link that lets you update profile information and group settings



Inserting the CommunityGroupProfile server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

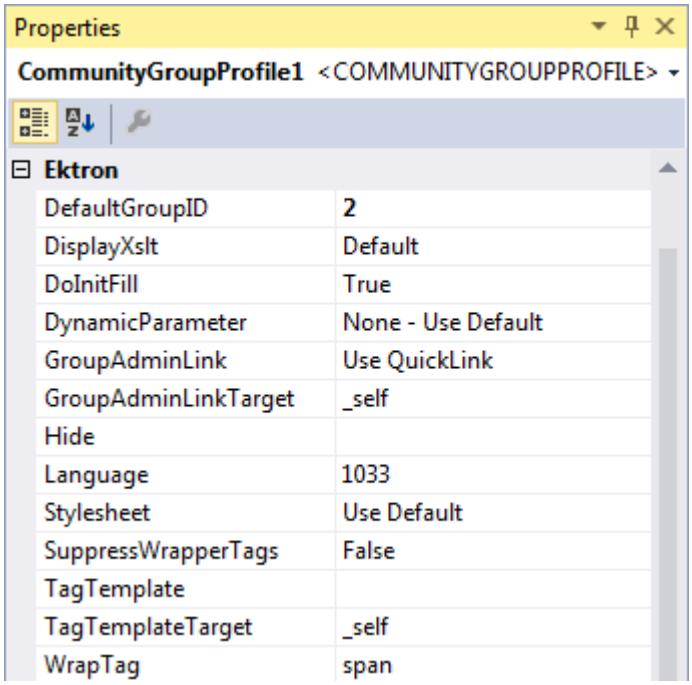
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CommunityGroupProfile** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:CommunityGroupProfile ID="CommunityGroupProfile1" runat="server" />
```

4. Click on `CommunityGroupProfile` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



CommunityGroupProfile properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DefaultGroupID** (Long)

  The default community group ID for this control to use when no matching dynamic parameter value is passed.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING! If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a community group ID dynamically. To use the default community group ID, leave blank.

- **GroupAdminLink** (String)

  Add a link to the administrator's profile page. This lets a user click a link in the community group page's profile area and be directed to the administrator's profile page. Two variables in the link identify the administrator.

  - **{0}**. Administrator's ID
  - **{1}**. Administrator's name

  Both variables must be in the link. The Web form can be relative or absolute. Below is an example.

  ```
  adminprofilepage.aspx?aid={0}&an={1}
  ```

- **GroupAdminLinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TagTemplate** (String)
  Add a path to another Web form to create links for the tag text. The path can be relative or absolute. By providing the path to CommunitySearch server control, a user viewing the profile can click a tag and search for other groups with the same tag. Five parameters, which are automatically added to the link's QueryString, let you pass information about the tag.
  - **searchgrptag**. The tag's text for community groups
  - **TagId**. The tag's ID
  - **TagLanguage**. The tag's language
  - **TagCount**. The tag's count. That is, the number of times a tag has been used.
  - **TagType**. The tag's type: user or community group

  You can also add your own parameters by defining them in the path. If you do, these parameters will be appended to yours. See also: Tagging Content, Library Items, Users, and Groups with Keywords
- **TagTemplateTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

ContentFlagging

8.50 and higher

Flagging lets site visitors provide feedback about a piece of content, thereby enabling site visitors to moderate your site. This is especially important for sites with large amounts of visitor-generated content. Flagging also helps site visitors feel invested in the site.

Inserting the ContentFlagging server control onto a page

PREREQUISITE

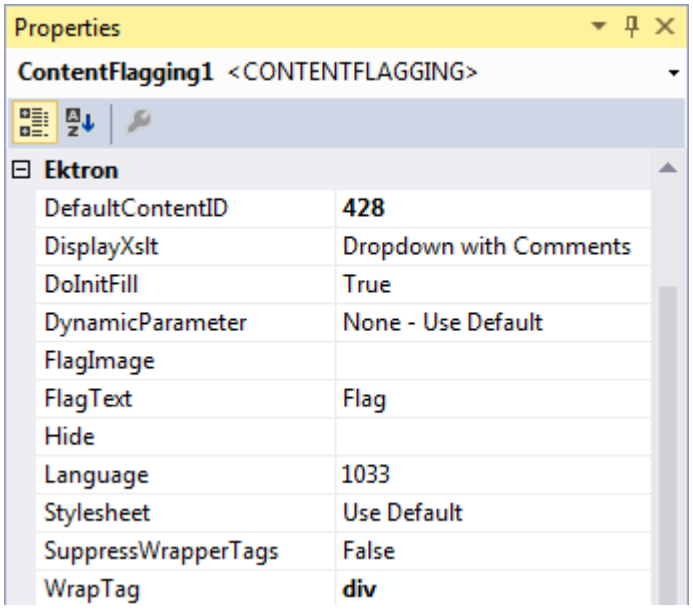
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ContentFlagging** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:ContentFlagging ID="ContentFlagging1" runat="server" />
```

4. Click on `ContentFlagging` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ContentFlagging properties

The ContentFlagging server control has the following properties. See also: Defining Flags for Content

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DefaultContentID** (Long)

  The default content ID for this control to use when there is no matching dynamic parameter value passed.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID dynamically. To use the default content ID, leave blank.

- **FlagImage** (String)

  Enter a path to an image that overrides the text in the `FlagText` property. When the image is clicked, the flag dialog appears.

- **FlagText** (String)

  Text for the link that is shown to allow flagging. For example, you might use "Click here to flag this content." The `FlagImage` property overrides this property. When the text link is clicked, the flag dialog appears.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **WrapTag** (String)

  Lets a developer specify a server control's tag.

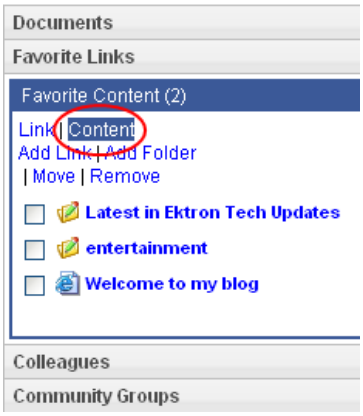
  - **Span** (default). Designate an inline portion of an HTML document as a span element.

- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

Favorites

8.50 and higher

The Favorites server control displays a list of Ektron content and external Web links (URLs) that a user has designated as favorite content. Within the control, Ektron content and URLs appear in separate lists. To view favorite content, click **Content**. To view a list of external URLs, click **Link**.



To learn about designating Ektron *content* as a favorite, see *SocialBar* on page 2312.

Inserting the Favorites server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

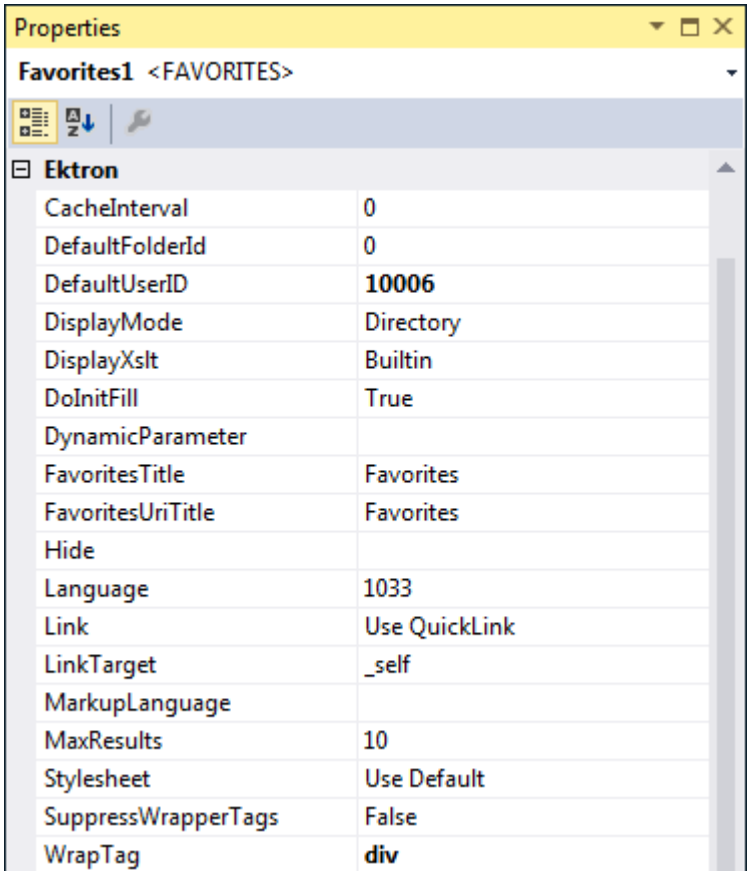
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Favorites** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Favorites ID="Favorites1" runat="server" />
   ```

4. Click on `Favorites` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



Favorites properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DefaultFolderID** (Long)
  The default folder ID for this control to use when there is no matching dynamic parameter value passed.
- **DefaultUserID** (Long)
  The default user ID for this control to use when there is no matching dynamic parameter value passed.
- **DisplayMode** (eDisplayMode)
  Select the way this control displays community group information. Choices are:

- **List**. Shows a list of Favorites sorted in alphabetical order.
- **Directory**. Groups favorites by folder. If this selection is chosen, the following menu items are added to the control:
- **Add Folder**. Allows a user to add a sub folder.
- **Move**. Allows a user to move content to a folder. This item only appears if at least one folder exists. See also: *Grouping favorites by folder* on page 2258

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

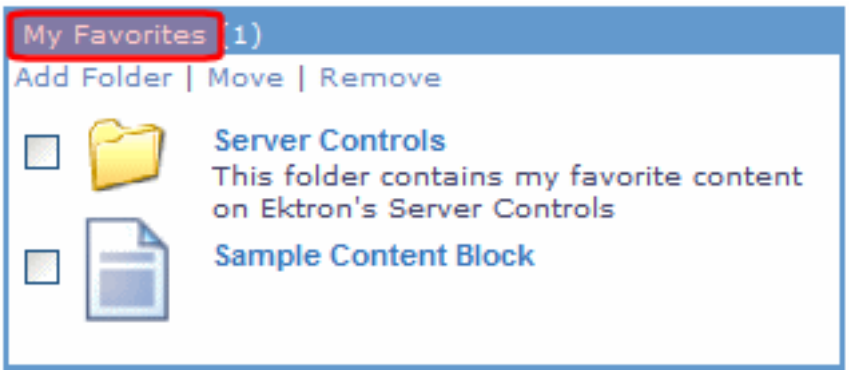
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a user ID dynamically. To use the default user ID, leave blank.

- **FavoritesTitle** (String)

  The title shown at the top of the control.



- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)(missing snippet link)
- **Link** (String)

  Enter a link to the content Web page. This allows a user to click a link in the Favorites control and be taken to the content.

  - **{0}**. Content ID
  - **{1}**. Content language
  - **{2}**. Content title

  The link must have all 3 variables. The Web form can be relative or absolute. Below is an example.

  ```
  contentpage.aspx?cid={0}&lang={1}&title={2}
  ```

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633*Ektron Markup Language* on page 2633

- **MaxResults** (Integer)

  The Maximum number of items to fetch. 0 (zero) = unlimited.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Adding a URL to your favorites

1. Log in and navigate to the profile page that hosts the Favorites control.
2. Click **Add Link**.
3. In the **Name** field, add a name for the URL link.
4. In the **Link** field, add the URL.
5. In the **Description** text area, add a description for the URL. This is optional.
6. Click **OK**.

After a URL is added, it appears on the control's **Links** list.

You also can add a URL to your Favorites by clicking the **Add to Favorites** link on the Social Bar server control. See .

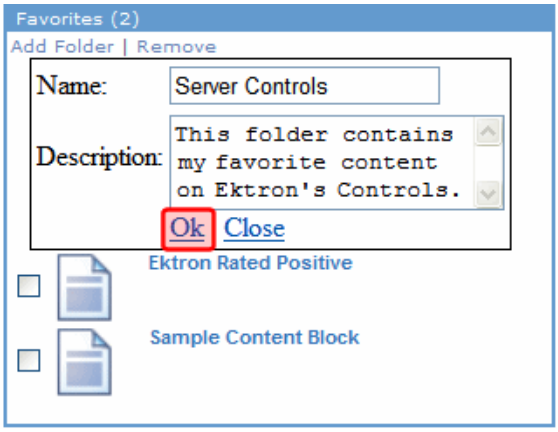
Grouping favorites by folder

The `DisplayMode` property controls whether a user's Favorites are displayed as a basic list, or if they can be organized in folders. For example, a user groups all content created by a certain author in a folder with that author's name. If you add a folder to a user's favorites, content in the folder appear in the **Content** list; URLs in the folder appear in the **Links** list.

To move a Favorite to a folder:

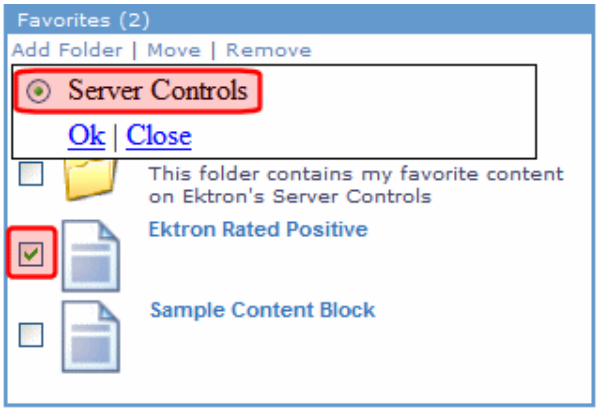
1. Make sure the Favorites server control's `DisplayMode` property is set to **Directory**.
2. Log in to the website.
3. Navigate to your profile page or the page the contains the Favorites server control.
4. In the Favorites server control, click **Add Folder**.
5. Enter a **Name** and **Description** for the folder.

6. Optionally check one or more favorite items then click **OK**.



7. Click **Move** on the Favorites server control.

8. Select a folder to which the items will be moved.



9. Click **OK**. A dialog box appears asking you confirm moving the items. You can find the Favorite content in the folder. Click the folder to see all content in that folder.

Deleting a favorites folder

WARNING! Deleting a folder also deletes all content links and URL links in the folder. If you want to retain the links, move them out of the folder before deleting it. To remove a link from a folder, click the folder, check the link, and click **MoveUp One Level**. Deleting a folder also deletes all of its subfolders.

1. Navigate to your profile page or a page the contains a Favorites server control.
2. In the **Favorites** section of the screen, click **Edit Folder** ( ) next to the folder's title. A dialog box appears.
3. Click **Delete**. A confirmation box appears.
4. Click **OK**. The folder is deleted.

Friends

8.50 and higher

The Friends server control typically appears on your profile page and displays your friends (colleagues). If you browse to another user's profile, you see that user's colleagues.

Inserting the Friends server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

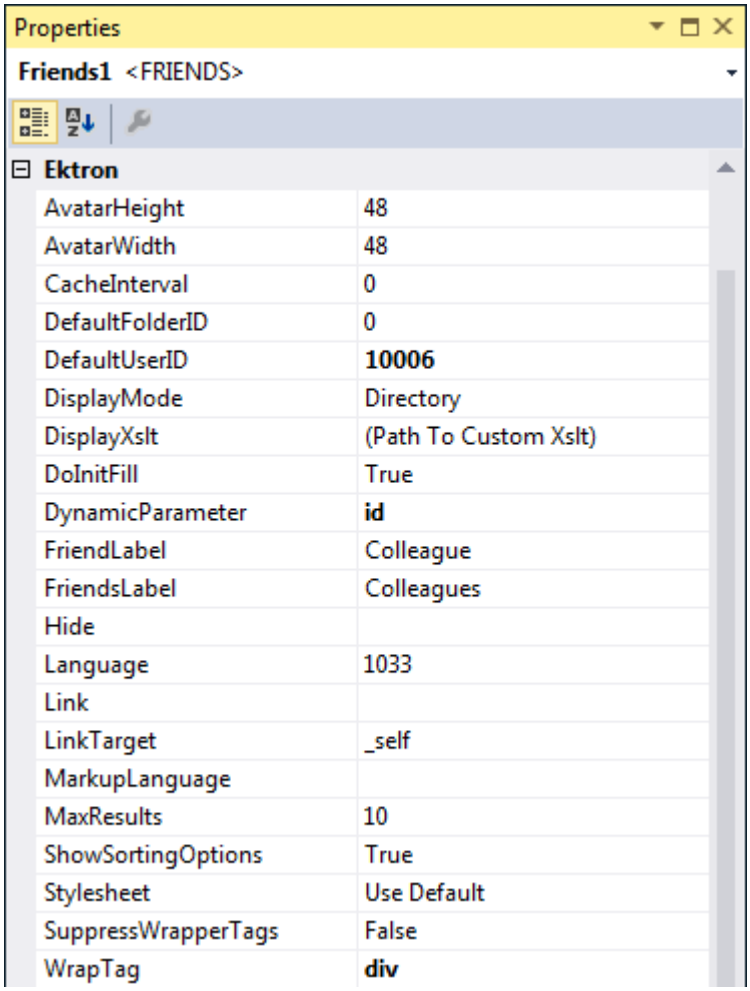
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Friends** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Friends ID="Friends1" runat="server" />
```

4. Click on `Friends` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Friends properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AvatarHeight** (Integer)

  The display height in pixels of the avatar in the results box. 0 (zero) = unlimited.

- **AvatarWidth** (Integer)

  The display width in pixels of the avatar in the results box. 0 (zero) = unlimited.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultFolderID** (Long)

  The folder ID that contains the user ID to display. If a DefaultContentID is given, it overrides this property.

- **DefaultUserID** (Long)
  The default user ID for this control if no matching dynamic parameter value is passed.
- **DisplayMode** (eDisplayMode)
  Select the way this control displays colleagues. Choices are:
  - **Directory**. Allows users to group colleagues by folders. In this mode, these menu items appear.
  - **Add Folder**. Lets user add a folder.
  - **Move**. Lets a user place colleagues in a folder. This option appears only if a folder exists.
  - **List**. Lists colleagues in alphabetical order
  - **Pending**. Lists users who have sent colleague requests to the logged-in user. The user can approve or decline these requests.
  - **SentInvites**. Lists users to whom the logged-in user sent colleague requests. The user can cancel invitations that have not been accepted yet.
- **DisplayXslt** (String)
  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Gets or sets the QueryString parameter to read a user ID dynamically. To use the default user ID, leave blank.
- **FriendLabel** (String)
  Set the singular text to be used as a title for the Friends server control. The default value is **Colleague**.
- **FriendsLabel** (String)
  Set the plural text to be used as a title for the Friends server control. The default value is **Colleagues**.

- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **Link** (String)
  Enter a link to the user profile page template. The path can be relative or absolute. This value is referenced when a user clicks another user in the Friends control. Upon clicking the link, the selected user's profile page appears. The link requires these variables.
  - **{0}**. Represents user ID
  - **{1}**. Represents user display name

  For example: `userprofilepage.aspx?uid={0}&dn={1}`
- **LinkTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633
- **MaxResults** (Integer)
  The maximum number of colleagues to display in the control. 0 (zero) = unlimited.
- **ShowSortingOptions** (Boolean)
  Determines if sorting options appear on the control. If set to **True**, the following options appear:
  - **Colleagues**. All current colleagues
  - **Pending**. Colleagues who sent you a colleague request that you have not

yet accepted
    - **Invited**. Colleagues to whom you have sent colleague requests
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

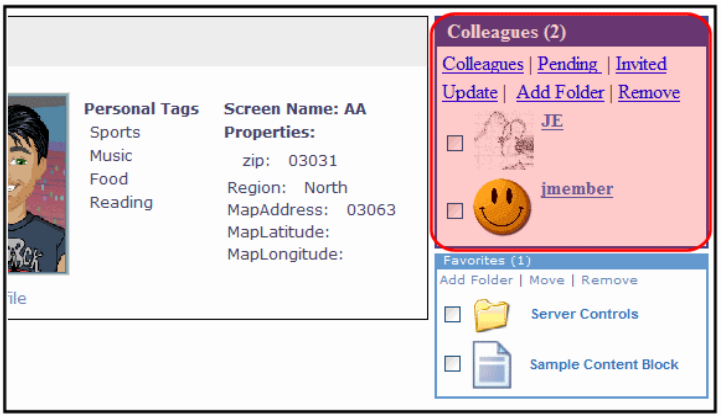
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
    - **True**. Suppress wrap tags.
    - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
    - **Span** (default). Designate an inline portion of an HTML document as a span element.
    - **Div**. Apply attributes to a block of code.
    - **Custom**. Lets you use a custom tag.

Using the Friends server control

The Friends server control displays a list of:

- **current colleagues**. Users who accepted your invitation to be a colleague, or whose invitation to be a colleague you accepted
- **pending colleagues**. Users who sent you a colleague request, which you have not yet accepted
- **invited colleagues**. Users to whom you have sent a colleague requests, which has not yet been accepted

The control can lets you navigate between views.



To manage existing colleagues on the website, find the **Colleague** area of your profile page. Here you can view, approve, and remove colleagues.

Managing colleagues

The following sections explain how to manage colleagues.

Viewing pending colleague requests

Pending colleagues are users who sent you a colleague request which you have not yet accepted. To view pending colleagues on the website, navigate to the **Pending Colleagues** area of your profile page. From here, you can accept or decline colleague requests.

Accepting a colleague request

Accepting a colleague request adds the user to your colleagues list. This lets you access additional information on the colleague's profile page.

1. Navigate to the **Pending colleagues** area of your profile page.
2. Place a check in the box next to each colleague whose request you want to accept.
3. Click **Approve**. The page refreshes, and the selected users are removed from the Pending Colleagues list and added to the colleagues list.

Declining a colleague request

Declining a colleague request cancels the request. When you decline the request, it is removed from your Pending Colleagues list and the requester's Invited list.

1. Go to the **Pending Colleagues** area of your profile page.
2. Place a check in the box next to each colleague whose request you want to decline.
3. Click **Remove Selected**. A dialog asks you to confirm.
4. Click **OK**. The page refreshes, and selected users are removed from your Pending Colleagues list and requester's Invited list.

Viewing invited colleagues

The Invited colleagues list displays users to whom you have sent colleague invites. From this screen, you can delete requests that have not yet been accepted. See also: *Viewing invited colleagues* above To view sent colleague requests, go to the **Invited Colleagues** area of your profile page.

Canceling invited colleagues

1. Go to the **Invited Colleagues** area of your profile page.
2. Place a check in the box next to each colleague whose invite you want to cancel.
3. Click **Remove Selected**.

Removing colleagues

1. Go to the **Colleagues** area of your profile page.
2. Place a check in the box next to each colleague you want to remove.
3. Click **Remove Selected**.

Designating a selected colleague

Selected colleague is a special category of user who can be given access to documents and photos that regular colleagues cannot view. A user makes this designation when sharing a Workspace, which can be shared with the Public, all colleagues, or selected colleagues.

1. Go to the **Colleagues** area of your profile page.
2. Check the box next to each colleague you want to make a Selected Colleague.
3. Click **Update**. **Selected Colleague** appears next to the colleague.

To change a selected colleague back to a colleague, check the box next to a selected colleague and click **Update**.

Creating a colleague group folder

Grouping lets you organize colleagues by folder. For example, you place all family members in a "Family" folder. You can only group current colleagues, not colleagues who are pending or invited.

The following sections explain how to work with Colleague folders.

Creating a colleague group folder

1. Make sure the `DisplayMode` property of the Friends server control is set to **Directory**.
2. Log in to the website.
3. Navigate to your profile page or a page the contains a Friends server control.

4. Click **Add Folder** in the Friends server control.
5. Enter a **Name** and **Description** for the folder.
6. Click **OK**.

Placing a colleague in a group folder

1. Navigate to your profile page or a page the contains a Friends server control.
2. Check one or more colleagues.
3. Click **Move** on the Friends server control. A list of folders appears. Select the folder to which you want to move them.
4. Click **OK**.

Renaming a folder

1. Navigate to your profile page or a page the contains a Friends server control.
2. In the **Colleagues** section of the screen, click **Edit Folder** () next to the folder's title. A dialog box appears.
3. Change the name, description or both.
4. Click **Save**.

Deleting a folder

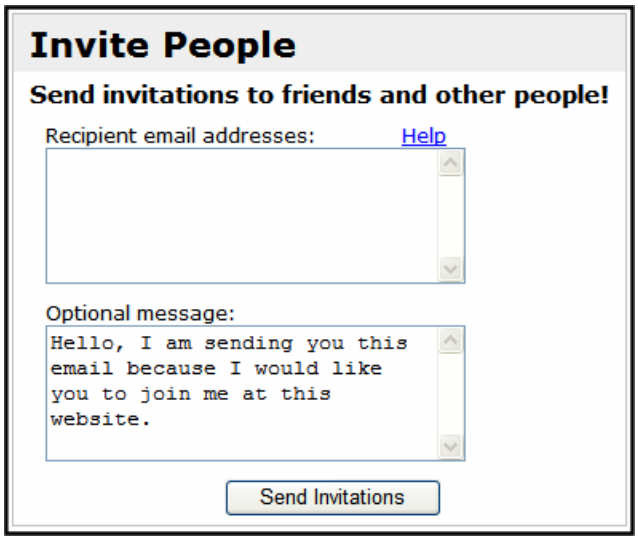
WARNING! Deleting a folder deletes all colleagues within it. To retain the colleagues, move them from the folder first by clicking the folder, checking the colleague, and clicking **Move Up One Level**.
Deleting a folder also deletes all of its subfolders.

1. Navigate to your profile page or a page the contains a Friends server control.
2. In the **Colleagues** section of the screen, click **Edit Folder** () next to the folder's title. A dialog box appears.
3. Click **Delete**.
4. Click **Save**.

Invite

8.50 and higher

The Invite server control lets a site visitor invite people to join a site or become a colleague. The control displays a dialog box that prompts for several email addresses. The dialog includes an optional message, which appears in the body of the email. The site visitor can edit or delete the message.



NOTE: Messages are defined in the Workarea. For more information, see Generating email Invitations for Community Management.

Invitations have a single "from" email address. Its default value is `invitations@example.com`. Your site administrator should change it to one that is appropriate for your organization. To change the "from" email address for invitations, open your site's `web.config` file and change the value of following key.

```
<add key="ek_InvitationFromEmail" value="invitations@example.com"/>
```

WARNING! The default *From* email address used to send all invitations is invitation@example.com. Episerver strongly recommends changing this address. See also: Generating email Invitations for Community Management.

Inserting the Invite server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

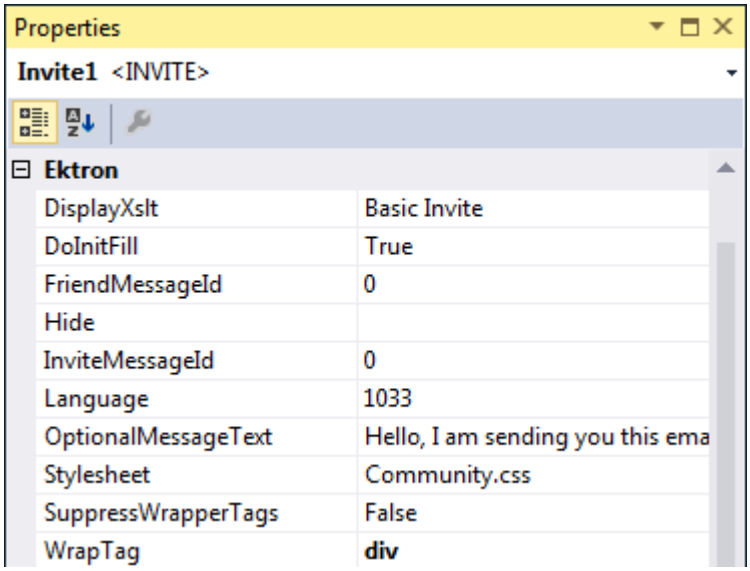
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Invite** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Invite ID="Invite1" runat="server" />
   ```

4. Click on `Invite` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Invite properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **FriendMessageId** (Long)

  The ID of the message to send in the link section of a FriendInvitation type email. This message is defined in the **Workarea > Settings > Community Management > Messages**. If set to 0 (zero), the server control uses the default message.

- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **InviteMessageId** (String)
  The ID of the message to send in the link section of a GroupInvitation or FriendInvitation email. This message is defined in the **Workarea > Settings > Community Management > Messages**. If set to 0 (zero), the server control uses the default message.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **OptionalMessageText** (String)
  The body text of the email message. The text appears in the Invite server control's dialog box and can be edited by site visitors when they use the Invite control.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

MessageBoard

8.50 and higher

The Message Board server control allows a user to submit comments on a Web page about a user, community group, or content item.

Comments are presented in a "wall" type format, which means that the newest one appears at the top, and older comments are pushed down as new ones arrive.

Other users can reply to comments. Replying to Message Board comments facilitates community building by allowing members to share information and, thereby, feel they have a personal stake in the discussion.

Comments are posted to the Message Board immediately unless the board is moderated. See also: Moderating a Message Board.

On a PageBuilder page, you can insert a Message Board using the Message Board widget.

Inserting the MessageBoard server control onto a page

PREREQUISITE

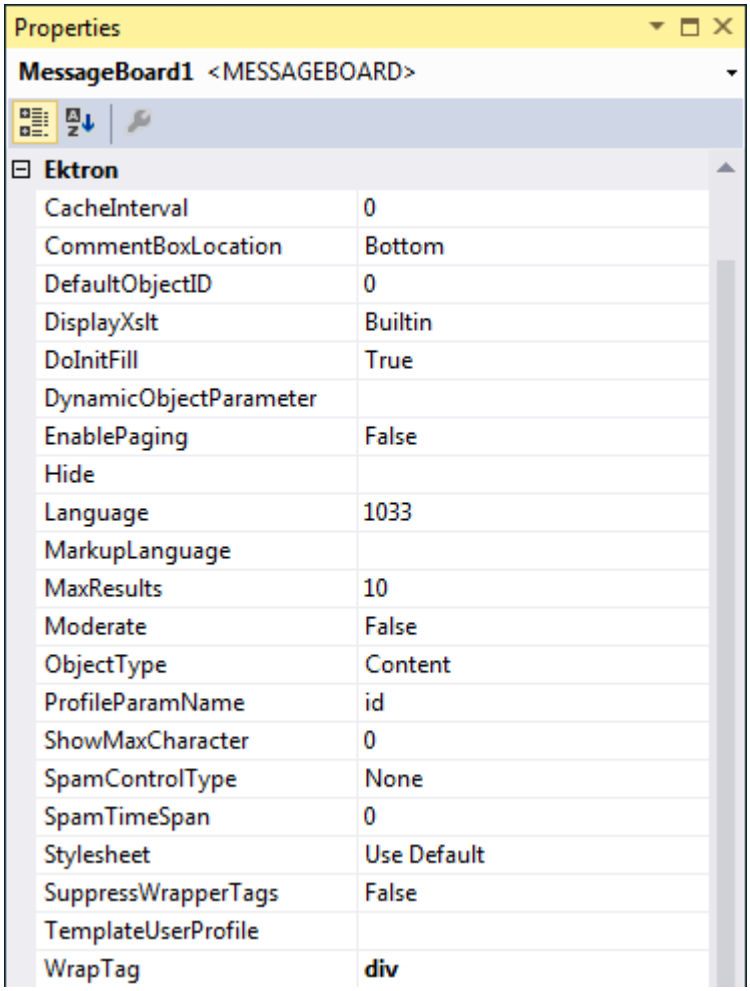
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **MessageBoard** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:MessageBoard ID="MessageBoard1" runat="server" />
```

4. Click on `MessageBoard` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



MessageBoard properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CommentBoxLocation**

  Defines the location of the comment box. By default, bottom is selected. Choices are:

  - **Bottom**. Comment box appears below the comments
  - **Top**. Comment box appears above the comments
  - **Data Type:** EkEnumeration.MessageBoardCommentBoxLocation
- **DefaultObjectID** (Long)

  The default object ID for this control to use when there is no matching dynamic parameter value passed.
- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.
- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicObjectParameter** (String)

  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank.
- **EnablePaging** (Boolean)

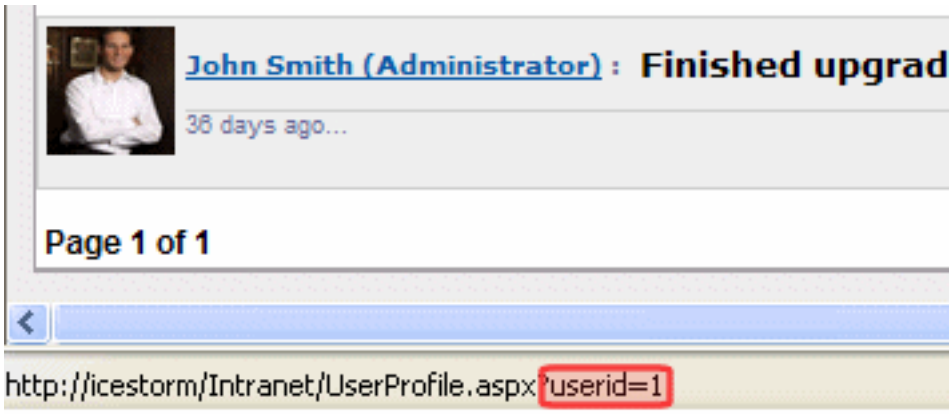
  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.
- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633*Ektron Markup Language* on page 2633
- **MaxResults** (Integer)
  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space, enter the maximum number of results per page here. Then, set the **EnablePaging** property to **True**. If you do and more than the number of **MaxResults** are available, navigation aids help the site visitor view additional items.
- **Moderate** (Boolean)
  Set to `True` to force moderation of the Message Board. If set to `false`, moderation is controlled by the user or community group with which the Message Board is associated. See also: Moderating a Message Board.
- **ObjectType** (EkEnumeration.MessageBoardObjectType)
  The type of object to which the Message Board is assigned. Choices are:
  - **Content**. A content item
  - **User**. An individual
  - **CommunityGroup**. A community group
- **ProfileParamName** (String)
  The parameter name to pass in the QueryString to the TemplateUserProfile page, if you want it to be anything other than id. For example, you may prefer `userid`, because it is more descriptive, as shown in the following example.



- **ShowMaxCharacter** (Integer)

  The maximum number of characters to display in the comment. If the number of characters in a comment exceeds this, a **... more >>** link appears. Users click the link to see the full text.

- **SpamControlType** (EkEnumeration.MessageBoardSpamControlType)

  Assigns a spam filter to the Message Board. Ektron provides 3 spam filters, and the ability to define your own. Spam control is turned off by default. Filter choices are:

  - **SameUserMessageDay**. A user cannot post the same comment to a board more than once per day
  - **SameUserTimeDelay**. Prevents user from posting another comment for period of time, specified in the `SpamTimeSpan` property.
  - **SameMessageTimeDelay**. Prevents user from posting an identical comment for a period of time, specified in the `SpamTimeSpan` property.
  - **Custom**. Message Board uses your custom spam filter code. See Filtering Spam.

- **SpamTimeSpan** (Integer)

  The number of seconds for which the `SameUserTimeDelay` or `SameMessageTimeDelay` spam filters delay a user from posting a second time. See also: Filtering Spam.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

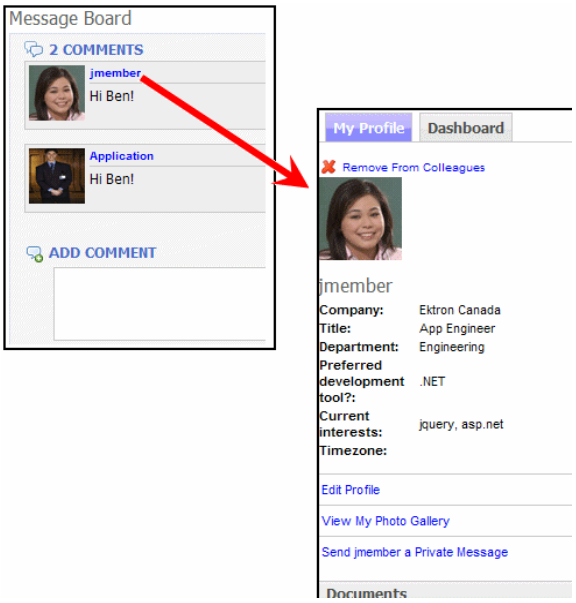
- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TemplateUserProfile** (String)

  The URL path to a page that contains a UserProfile server control. The path can be relative or absolute. If you enter a path, a user can click any user's name or avatar from the Message Board server control and be forwarded to that profile page. See illustration below.



Note that user templates can be defined in the **Workarea > Settings > Community Management > Templates** screen. However, if you assign a template in this field, this setting takes precedence over the setting on the Workarea Template screen.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Messaging

8.50 and higher

The Messaging server control lets a site user send and receive messages. You can limit message recipients to a user's colleagues or expand it to all Ektron users. The Messages control can appear on a site or also in the Workarea. Typical messaging functions apply, such as compose (in the Workarea), reply (in the Workarea), forward (in the Workarea), print (in the Workarea), delete (in a sample site, in the Workarea).

Populating the To: field of a message

You can populate a message's **To:** field with user names by setting the `RecipientParamName` property to a QueryString parameter. This feature lets you create a link on a page, such as **Send a Message to this user** or **Send a message to all users in this group**. For example, you create a Web page link to a template containing the Messaging server control, pass a user's ID in the QueryString as UID,

and populate the `RecipientParamName` property with **UID**. As a result, the server control reads the user's ID and completes the **To:** field with the user's name.

Here is how the link might look: `messaging.aspx?g=pmessage&uid=1`

You can pass multiple user IDs. For example:
`messaging.aspx?g=pmessage&uid=1&uid=20&uid=12&uid=18`

IMPORTANT: You must include the `g=pmessage` parameter in the QueryString to open the Messaging server control to its editor. Otherwise, the server control opens to the Inbox.

The VB example below creates a dynamic hyperlink that populates a message's **To**: field with a logged in user's colleagues. For this example to work, add a Literal control to a Web form and name it **Lit1**. Notes are included as comment text.

```
Protected Sub Page_Load(ByVal sender As Object,
  ByVal e As System.EventArgs) Handles Me.Load

    Dim frnds As New Ektron.Cms.API.Community.Friends()
    Dim apicontent As New Ektron.Cms.ContentAPI
    Dim dirUsrData() As Ektron.Cms.DirectoryUserData

    If (apicontent.UserId > 0) Then
      dirUsrData = frnds.GetFriends(apicontent.UserId)
      If ((Not IsNothing(dirUsrData)) AndAlso (dirUsrData.Length > 0))
      Then
        Dim idx As Integer
        Dim friendsList As String = String.Empty
        For idx = 0 To dirUsrData.Length - 1
          'friendsList += "&uid=" + dirUsrData(idx).Id.ToString()
            friendsList = friendsList + "&uid="
            + dirUsrData(idx).Id.ToString()
        Next
          Lit1.Text = "<a href=""MsgSample.aspx?g=pmessage" + friendsList
            + """>Send a message to my friends</a>"
'
'Replace MsgSample.aspx with the Web form that contains
'the messaging server control.
'Set the RecipientParamName property to "uid" for this example.
'
        Else
            Lit1.Text = "The logged in user currently has no friends"
        End If
        Else
            Lit1.Text = "You must be logged in to run this demo"
        End If
        apicontent = Nothing
        frnds = Nothing
 End Sub
```

Inserting the Messaging server control onto a page

PREREQUISITE

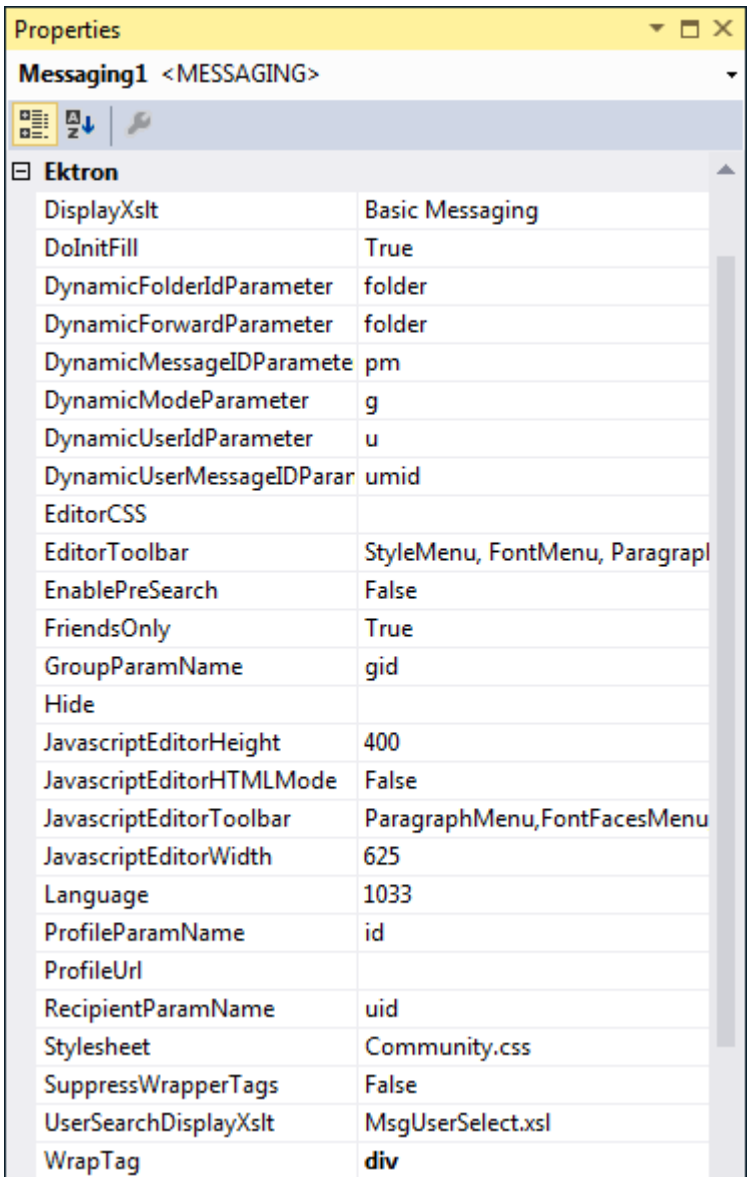
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Messaging** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Messaging ID="Messaging1" runat="server" />
```

4. Click on `Messaging` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Messaging properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **EnablePreSearch** (Boolean)

  When set to True, all users are pre-loaded and displayed in the search results when browsing for users (an empty string search). If the `FriendsOnly` property is set to True, only colleagues are pre-loaded and displayed.

- **FriendsOnly** (Boolean)

  When set to True, users can only send messages to their colleagues.

  - **True** (default). Send messages to colleagues only
  - **False**. Send messages to all Ektron users

- **GroupParamName** (String)

  Enter the QueryString parameter used to pass the ID of a community group. The default is **gid**. Use this property to email all members of a group.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **JavascriptEditorHeight** (Integer)

  Set the height in pixels for the eWebEdit400 editor. The default is **300**.

- **JavascriptEditorWidth** (Integer)

  Set the width in pixels for the eWebEdit400 editor. The default is **360**.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **ProfileParamName** (String)

  The QueryString parameter used to pass the ID of a user to a profile page or location template when a user name is clicked in the Browse User screen. The default is ID. The parameter defined in this property is appended to the QueryString of the path defined in the `ProfileUrl` property. The default is ID.

  IMPORTANT: This parameter must match the parameter set in the UserProfile server control's `DynamicParameter` property on the page defined in the `ProfileUrl` property.

- **ProfileUrl** (String)

  The URL of the profile page template. This page opens in a new window when a user clicks a display name on the Browse Users screen. This provides additional profile information about the potential message recipient.

- **RecipientParamName** (String)

  Enter the QueryString parameter used to pass a user ID. For example, if the QueryString is `?uid=1`, enter `uid` in this property. To pass several users, enter a comma -separated list of user IDs. For example: `?uid=1,20,12,18`. This property is typically used when you want to populate a message's **To:** field. See also: *Populating the To: field of a message* on page 2276

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **UserSearchDisplayXslt** (String)

  The XSLT used to display the user search control inside the Messaging server control. The default is `MsgUserSelect.xsl`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

MicroMessaging

8.50 and higher

The MicroMessaging server control lets users post brief messages. It resembles micro-blogging services like Twitter.

Inserting the MicroMessaging server control onto a page

PREREQUISITE

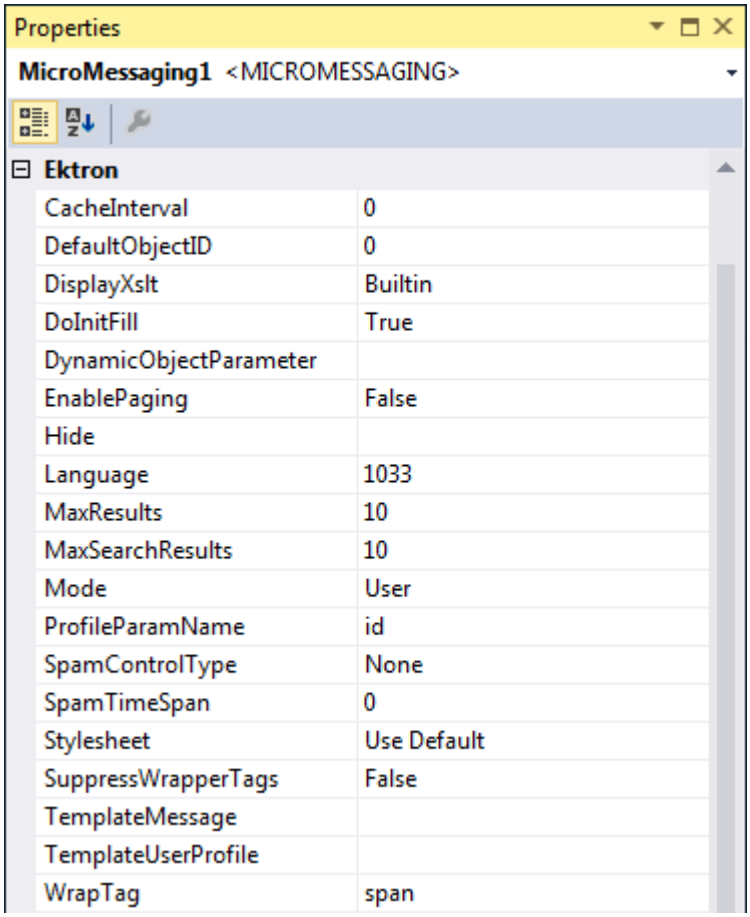
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **MicroMessaging** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:MicroMessaging ID="MicroMessaging1" runat="server" />
   ```
4. Click on `MicroMessaging` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



MicroMessaging properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultObjectID** (Long)

  The default object ID for this control to use when there is no matching dynamic parameter value passed.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file,

create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicObjectParameter** (String)

  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank. For example, if you are passing the ID value of a user, you might enter 'uid' for this property. So, if you passed `http://~yoursite~/UPpage.aspx?uid=21` on the QueryStrings to a page containing this control, you would see the list of Micro-messages for the user with an ID of 21.

- **EnablePaging** (Boolean)

  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **MaxResults** (Integer)

  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space, enter the maximum number of results per page here. Then, set the **EnablePaging** property to **True**. If you do and more than the number of **MaxResults** are available, navigation aids help the site visitor view additional items.

- **MaxSearchResults** (Integer)

  The maximum number of messages to return when performing a micro-message search.
  0 (zero) = unlimited.

- **Mode** (ActivityFeedType)

  Specify the type of micro-messages you want to display. Choices are:

  - **User**. Micro-messages for logged-in user with search option
  - **Colleagues**. Micro-messages for logged-in user and colleagues of a specified user with search option
  - **TimeLine**. Micro-messages from all site users whose Private Profile setting is set to Public; includes search option
  - **Message**. A single message
- **ProfileParamName** (String)

  The parameter name to pass in the QueryString to the TemplateUserProfile page, if you want it to be anything other than id. For example, you may prefer `messageid`, because it is more descriptive.
- **SpamControlType**

  Assigns a spam filter to the micro-messages. The control supplies 3 predefined spam filters, and the ability to define your own. Spam control is turned off by default. Filter choices are:

  - **SameUserMessageDay**. Prevents a user from posting the same message to the board more than once per day
  - **SameUserTimeDelay**. Prevents a user from posting another message for specified period of time. The amount of time is specified, in seconds, in the `SpamTimeSpan` property.
  - **SameMessageTimeDelay**. Prevents a user from posting an identical message for a specified period of time. The amount of time is specified, in seconds, in the `SpamTimeSpan` property.
  - **Custom**. Control uses custom spam filter code. See Filtering Spam.
- **SpamTimeSpan** (Integer)

  Sets the amount of time, in seconds, for which the `SameUserTimeDelay` or `SameMessageTimeDelay` spam filter delays a user from posting. These values can be selected in the `SpamControlType` property. See also: .
- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.
- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateMessage** (String)

  The URL path to a page that contains another Micro-messaging server control. When this property contains such a path, and the destination page has a Micro-messaging control whose `Mode` property is set to `Message`, a user can click a micro-message's time span on the first page to open a second page that contains just that message.See also: .

- **TemplateUserProfile** (String)

  The URL path to the page that contains the UserProfile server control. The path can be relative or absolute. If you enter a path, a user can click any user's name or avatar from the Micro-message server control and be forwarded to that profile page.

  Note that user templates can be defined in the **Workarea > Settings > Community Management > Templates** screen. However, if you assign a template in this field, this setting takes precedence over the setting on the Workarea Template screen.

- **WrapTag** (String)

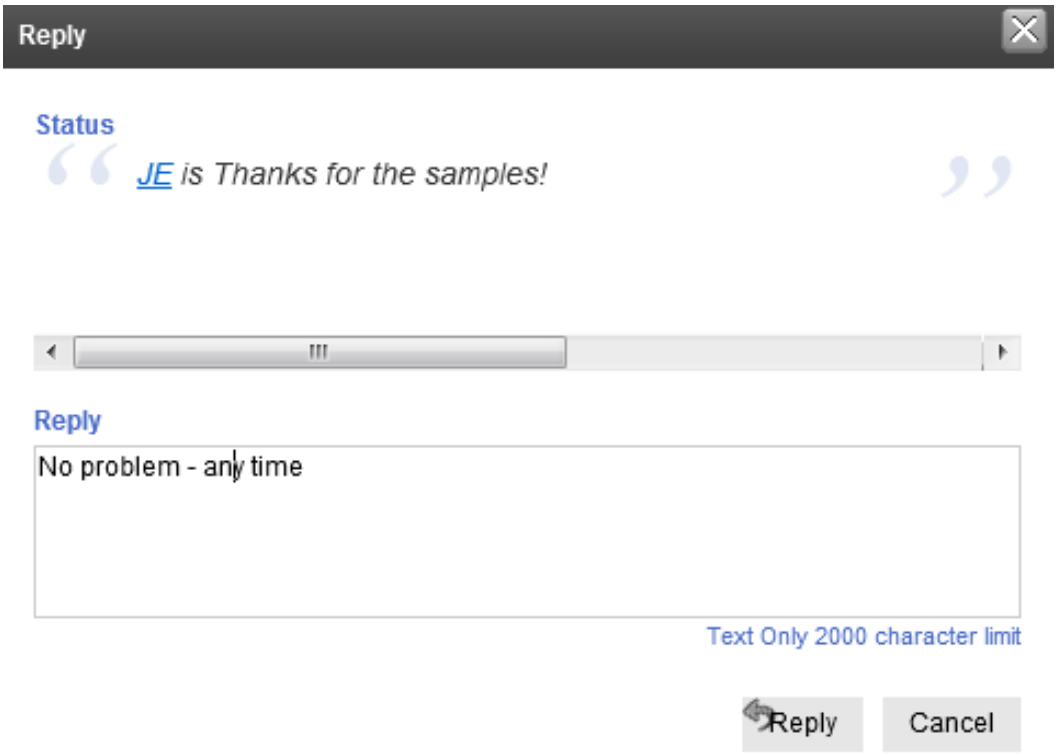
  Lets a developer specify a server control's tag.

  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

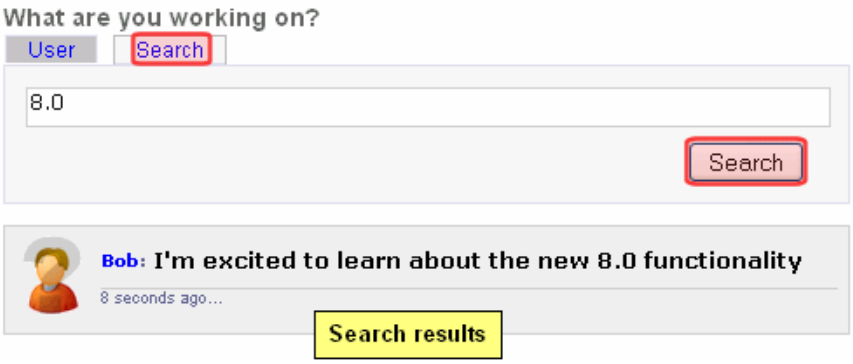
Using the Micro-messaging server control

The Micro-messaging server control allows users to post brief messages. It resembles micro-blogging services like Twitter.

A user can reply to another user's micro-message.



The control also lets users search micro-messages. See also: *Searching for micro-messages* on page 2293



In addition, micro-messages are a type of notification.

This feature builds tighter-knit communities by allowing members to share information and feel they have a personal stake in that information.

NOTE: If you are in a load-balanced environment, the same reply may appear several times. If this problem occurs, stop the Ektron notification service on all but one of the servers in the cluster.

This section also contains the following topics.

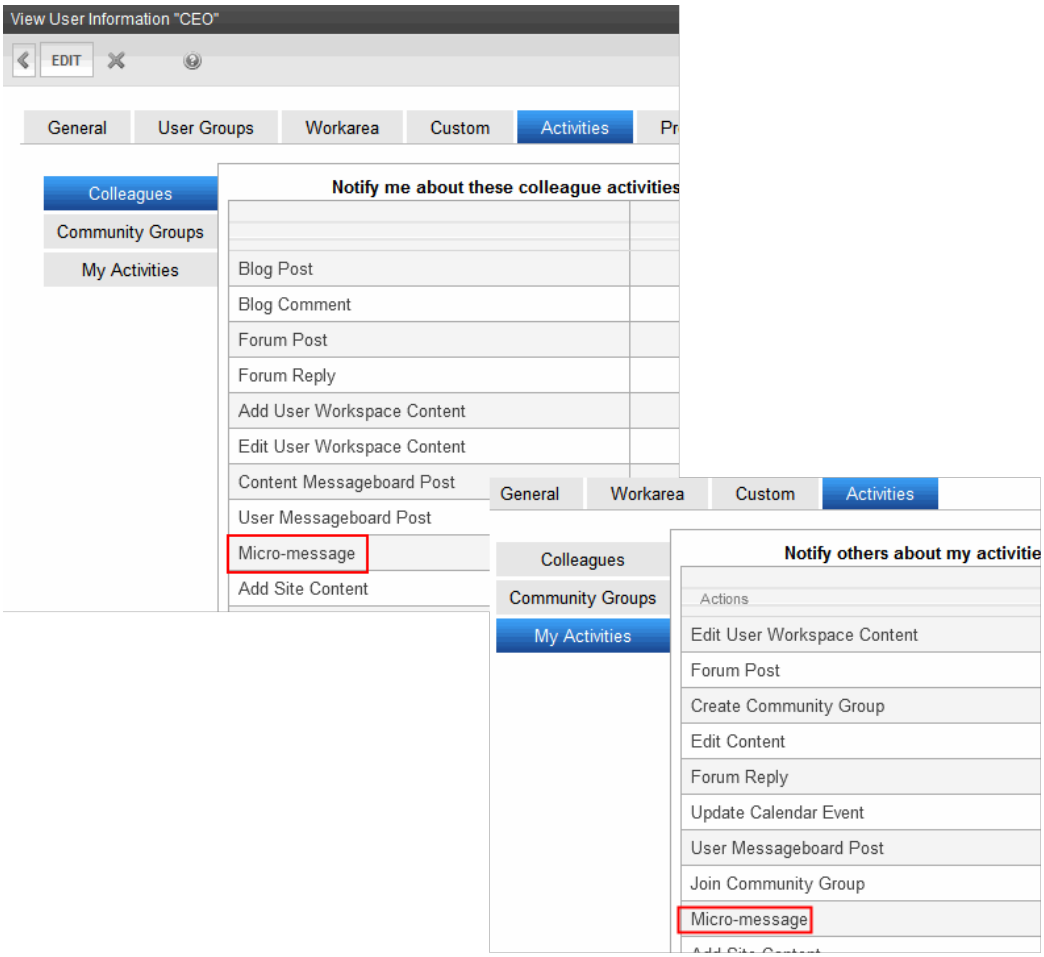
NOTE: A user's **Private Profile** setting has 3 possible values: **Public**, **Private** and **Colleague**. When discussing this control and these settings, **Private** and **Colleague** both act as **Colleague**.

Micro-messages are an activity type

A micro-message is type of Ektron activity, like adding content or joining a Community Group. As such, a new micro-message can generate a notification. See also: Sending Notifications to a Community.

Like other notifications, micro-messages can appear on an Activity Stream control.

Users can determine if they want to be notified about colleagues' micro-messages on the **User Profile > Activities > Colleagues** tab, and if want to notify others on the **My Activities** tab.



Micro-messaging display modes

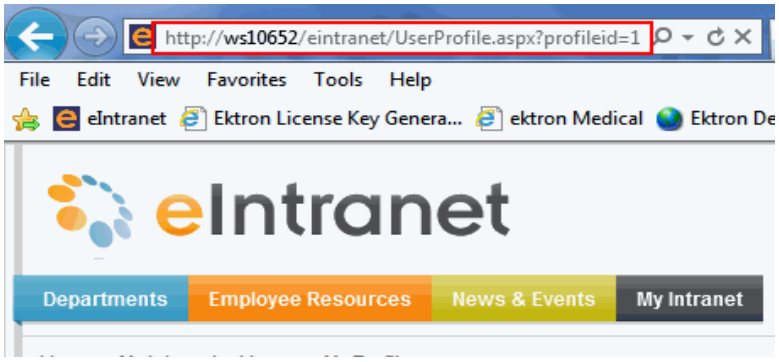
This Micro-messaging server control has 4 modes, which let you control the messages being displayed.

Associating the control with a user

Like other Ektron server controls, there are 2 ways to specify the user associated with the control.

- the server control's `DefaultObjectID` property. Do this to display a particular user's micro-messages on a page.
- the user ID is retrieved from the page URL, which typically contains the logged-in user ID (see example below). Do this to display micro-messages of the

logged-in user.

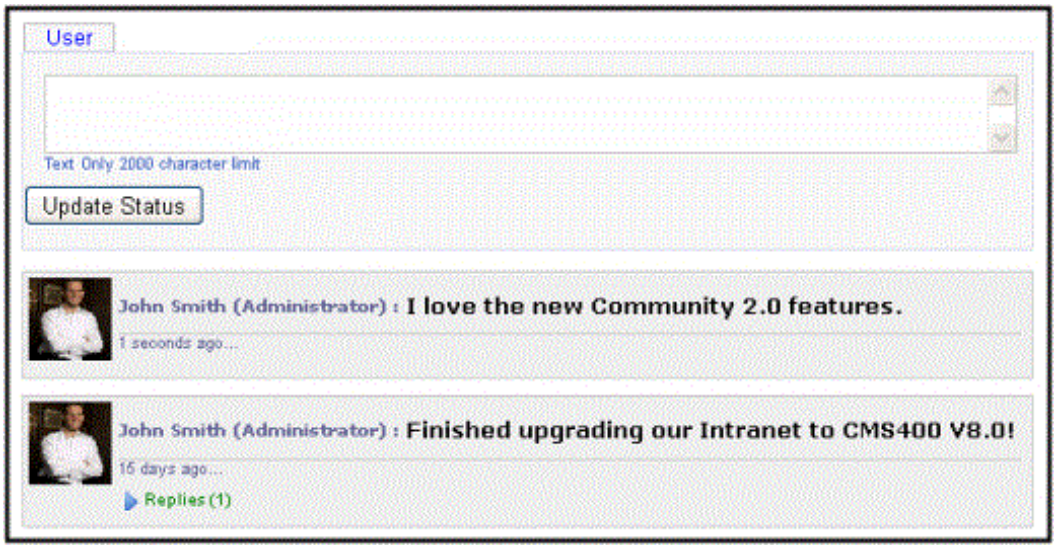


User mode

Use this mode to show micro-messages for a specified user, such as on a User Profile page. For example, when you view your own page in User Mode, you can

- see your messages
- submit a new micro-message. For example, you update your status.
- search micro-messages. See also: *Searching for micro-messages* on page 2293.

The following example of the Micro-messaging server control with the Mode property set to `User`.



In User Mode, you can view the control that is associated with another user. For example, when you view another's profile, which contains the Micro-messaging control in User Mode, you see only micro-messages of the user who owns the profile. You cannot submit a micro-message from your colleague's profile page, nor can you search micro-messages. For example, you and Steve are colleagues. When you view Steve's profile page:

- you can see all of Steve's messages
- you can see messages from colleagues they have in common
- you *cannot* update Steve's status
- you *cannot* search messages

Colleagues mode

Colleagues Mode displays micro-messages from the user associated with the control *and the user's colleagues*. Use this mode to show micro-messages for these users, such as on a user profile page. When you are logged in and visit a page containing a Micro-messaging control in colleagues mode, you can:

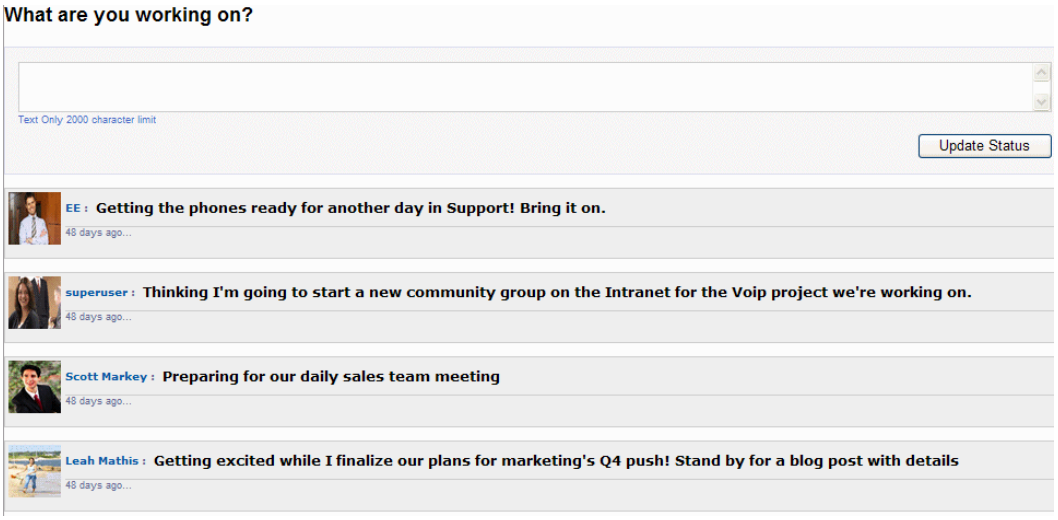
- see the colleague's messages
- see the colleagues' messages from other colleagues
- update the colleague's profile
- search micro-messages. See also: *Searching for micro-messages* on page 2293

You also can view the control in Colleagues Mode when it is associated with another user. For example, when you view another user's profile, which contains the Micro-messaging control in Colleagues Mode, you see only micro-messages from the user who owns the profile and the colleagues that you have in common with the user. You cannot submit a micro-message from the colleague's profile page, nor can you search micro-messages. For example, you and Steve are colleagues. When you view Steve's profile page:

- you can see Steve's messages
- you can see messages from colleagues you have in common
- you *cannot* update Steve's status
- you *cannot* search messages

TimeLine mode

This mode displays micro-messages for a site's users whose **Private Profile** setting is set to **Public**. This mode displays a chronological stream of micro-messages from all such users, with the most recent at top.

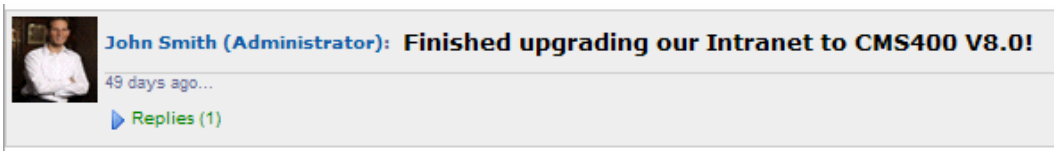


Whenever a user whose profile is set to Public submits a micro-message, it's added to the time line.

From the time line page, logged in users can reply to and search micro-messages. See also: *Replying to a micro-message* on page 2295, *Searching for micro-messages* on the facing page

Message mode

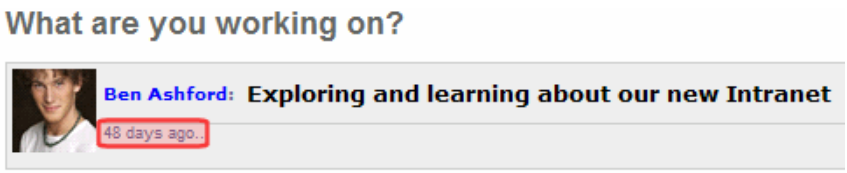
This mode displays a single micro-message on a page.



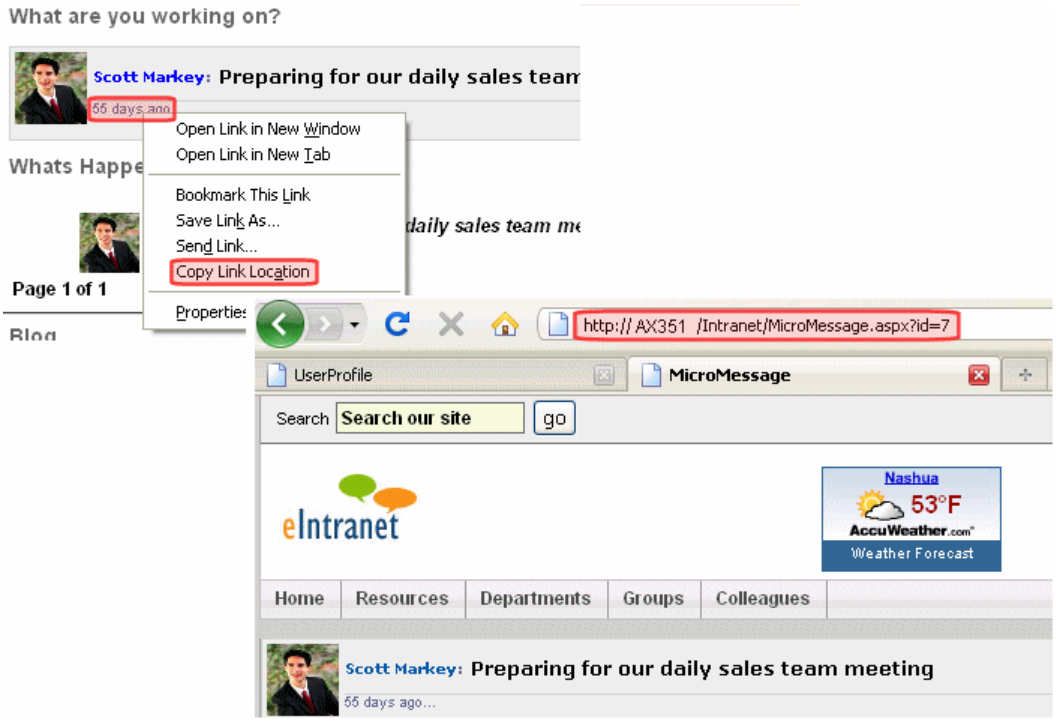
For example, John sends his boss a link to a micro-message that praises his work. When John's boss clicks the link, a page that contains this control appears. See also: *Making a hyperlink to a single-page version of a micro-message* below

Making a hyperlink to a single-page version of a micro-message

Each micro-message includes a *time lapse*, that is, the length of time since a message was submitted. See example below.



Each micro-message's time lapse can become a hyperlink that contains the ID of that message and a destination window. Users can click the link to view that message in the new window.



The destination window must

- be identified in the properties of the Micro-messaging server control that displays the original message
- contain a Micro-messaging server control in Message Mode

Users can also copy the link and send it to another user, who can then view the message. To copy a time lapse's link information, hover over the link, right click, and select **Copy Shortcut** (if using Internet Explorer) or **Copy Link Location** (if using Firefox).

NOTE: If someone sends a micro-message link to another user who is ineligible to see the message, it does not appear. To see the message, either the user who submitted it has the profile set to **Public,** or the link recipient must be a colleague of the message's creator.

The following example shows how to set up this capability.

- `Page1.aspx` contains a Micro-messaging server control that displays a user's micro-messages. The messages' time lapses are hyperlinks.
- `Page2.aspx` has a Micro-messaging server control in Message Mode. It displays the individual message whose time lapse was clicked on the first page.

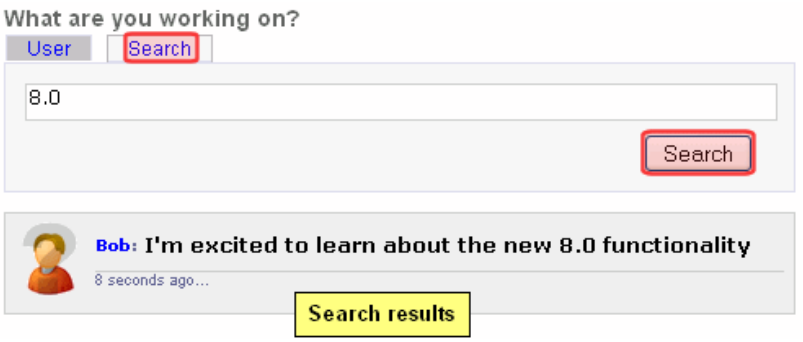
NOTE: For a full description of the micro-message properties, see *MicroMessaging properties* on page 2282.

1. On `Page1.aspx`, add a Micro-messaging server control.
2. Set the `DynamicObjectParameter` to `id`.
3. Set the `TemplateMessage` to the path to `Page2.aspx`.
4. Set the `Mode` property to anything other than `Message`.
5. Save `Page1.aspx`.
6. On `Page2.aspx`, add a Micro-messaging server control.
7. Set the `DynamicObjectParameter` to `id`.
8. Set the `Mode` property to `Message`.
9. Save `Page2.aspx`.

Now, when you log in to your site and navigate to `Page1.aspx`, you see a list of your micro-messages. If you click the time lapse on any message, `Page2.aspx` loads, showing the message you clicked.

Searching for micro-messages

The Micro-messaging server control includes search functionality that prompts a user to enter terms and returns micro-messages that match them. The search looks through micro-messages only. It does *not* search content, products, users, or groups.



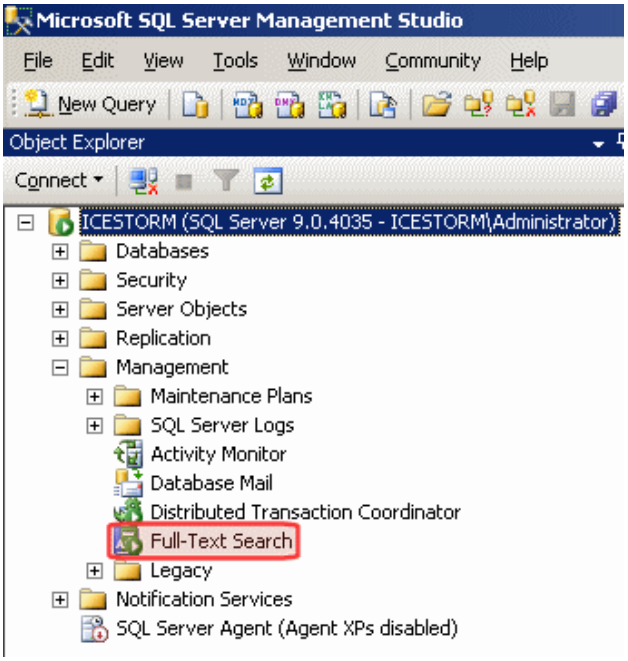
When searching, a user can only find micro-messages submitted by

- one's self
- one's colleagues
- users whose profile is set to public

The following topics explain how to enable and use the micro-message search.

Enabling the micro-message search

The micro-message search requires your server to have the Full Text Search component of Microsoft SQL Server.



You can install the Full Text Search component during the installation of Microsoft SQL Server.

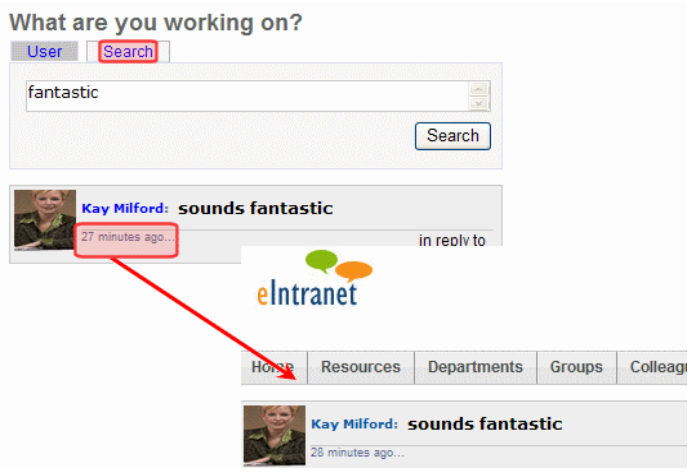
If the Full Text Search component is not installed, and you want to use the Micro-messaging search functionality, insert the SQL Server installation disc into your computer and look for **Full Text Search**.

After the Full Text Search is installed, run the FullTextIndex.sql script on your database. This script is located in:

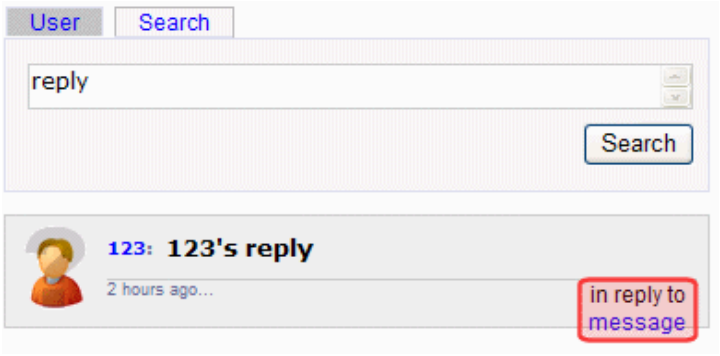
```
Program Files\Ektron\CMS400vxversionnumber\
  Utilities\SiteSetup\Database\FullTextIndex.sql
```

Running a micro-message search

When micro-message search is enabled, a **Search** tab appears on the control. To use the search, click the tab and enter search terms.



When results appear, you can click any message's time span to proceed to the message itself. If a reply appears among search results, you can click the link indicated below to view the original message.



Entering multiple search terms

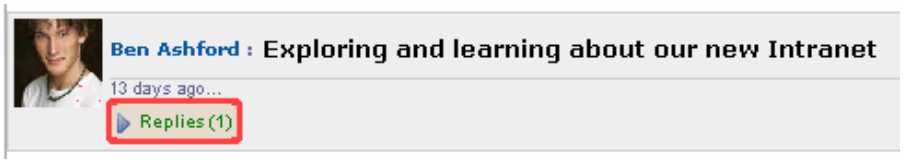
You can enter more than one search term. If you do, the terms have an "and" relationship. For example, if you enter **Community** and **Group**, only messages containing *both* Community *and* Group are found.

Replying to a micro-message

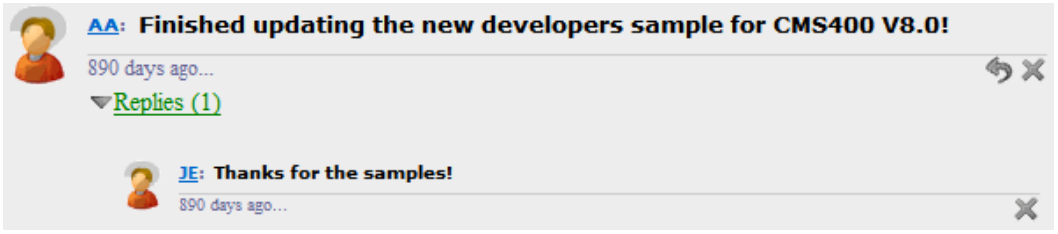
The micro-message control lets users reply to micro-messages and nests the reply with the original message. Anyone who can see a message can reply to it, and see all other replies.

To add a reply, hover over a message and click **Reply** ( ). When you do, a dialog box prompts you to submit a reply of up to 2000 characters. The box also displays the original message.

Replies do not appear when a micro-message is viewed. Instead, a **Replies** link appears below the comment. The number of replies appears next to the link.



Click **Replies** to view them. The newest replies are at the top.



To remove a reply, click **Delete** ( ), which appears when you hover over the reply. Only the user who submitted the reply and the message board owner can delete replies.

NOTE: If you are in a load-balanced environment, the same reply may appear several times. If this problem occurs, stop the Ektron notification service on all but one of the servers in the cluster.

Filtering micro-message spam

You can filter spam from micro-messages. Ektron defines spam filtering as preventing users from posting a micro-message or replying using:

- the same message more than once a day
- any second message within a specified time period after posting a first
- the same message within a specified time period

NOTE: If a user enters a micro-message and a reply that have the same text, each can be sent once without being stopped by the spam filter. However, if either is sent a second time within the specified time period, the spam filter blocks it.

The Micro-messaging server control also lets you define custom spam filters.

To define a spam filter, use the `SpamControlType` property on the MessageBoard server control. The table below provides possible values and examples of how to set that property.

Ektron lets you filter spam from your message boards. Ektron defines *spam filtering* as setting the following limits in MessageBoard server control's SpamControlType property:

- **SameUserSameMessageSameDay**. Prevent a user from posting the same comment more than once a day.
- **SameUserTimeDelay**. Set the SpamTimeSpan property to 1800 to prevent a user from posting any other comment for 30 minutes.
- **SameMessageTimeDelay**. Set the SpamTimeSpan property to 7200 to prevent a user from posting identical comments for 2 hours.
- **Custom** (and add the code to the code-behind page of the template containing the MessageBoard server control). Use your own spam filter code.

Creating a custom spam filter

You can create your own spam filter in the code-behind of the page that contains the Micro-messaging control. To do this, set the `SpamControlType` property to `Custom`, call the `CustomSpamMethod` in the page load event, and point it to your custom spam filter method.

The following Visual Basic example blocks the text "Hello World."

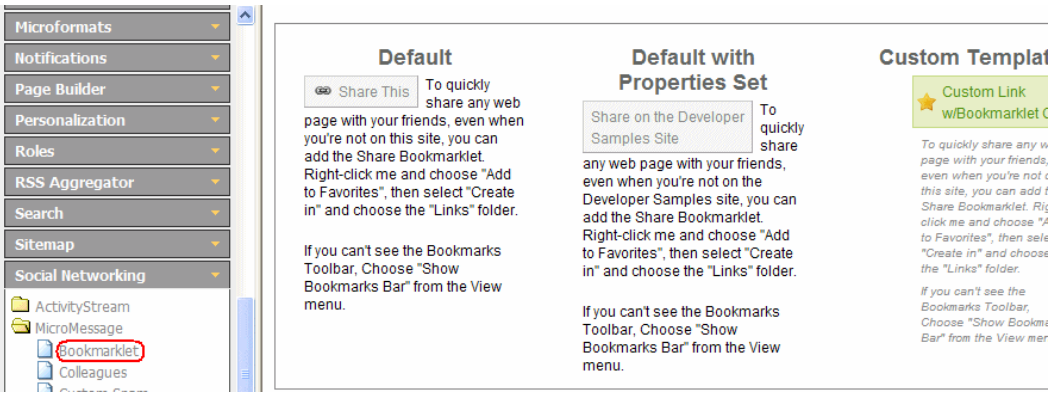
```
                                        Partial Class Default
Inherits System.Web.UI.Page
Protected Sub Page_Load(ByVal sender As Object, ByVal e As System.EventArgs) Handles
Me.Load
Me.MicroMessaging1.CustomSpamMethod(AddressOf SpamHandler)
End Sub
Private Function SpamHandler(ByVal data As   Ektron.Cms.MicroMessageData) As Boolean
If data.MessageText = "Hello World" Then
Return True
End If
```

```
End Function
End Class
```

MicroMessagingBookmarklet

8.60 and higher

The MicroMessagingBookmarklet server control detects the user's browser and modifies the text accordingly. For more information, see Using Ektron's MicroMessagingBookmarklet.



Inserting the MicroMessagingBookmarklet server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

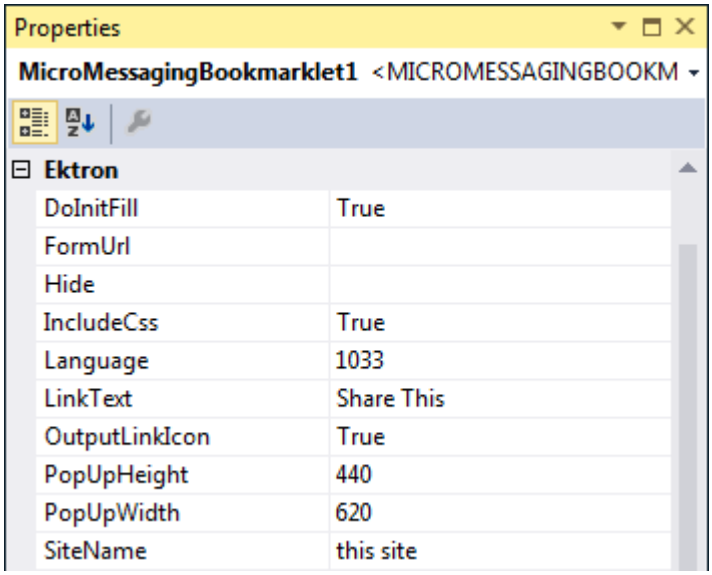
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **MicroMessagingBookmarklet** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:MicroMessagingBookmarklet ID="MicroMessagingBookmarklet1" runat="server" />
```

4. Click on `MicroMessagingBookmarklet` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is

updated as you modify the property values.



MicroMessagingBookmarklet properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **FormUrl** (String)

  The path to the page that appears when a user clicks the MicroMessagingBookmarklet link. By default, when a user clicks a link, he is redirected to the `siteroot/Workarea/share.aspx` page.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeCSS** (Boolean)

  Lets you include or exclude the control's default .css file, which provides the "look and feel" of the control on a Web page.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkText** (String)
  The text that appears on the MicroMessagingBookmarklet link.

  To modify the look and feel of this area, edit the ektron.micromessaging.bookmarklet.css file in the *siteroot*/Workarea/csslib folder.

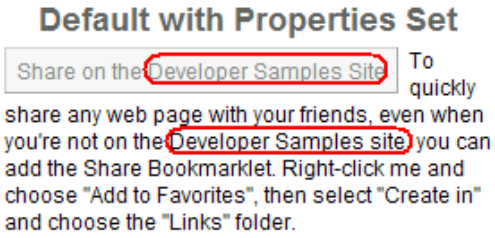
- **OutputLinkIcon** (Boolean)
  - **False**. Suppress the icon
  - **True**. Show the MicroMessagingBookmarklet link icon on the button

  To modify the look and feel of this icon, edit the ektron.micromessaging.bookmarklet.css file in the *siteroot*/Workarea/csslib folder.

- **PopupHeight** (Integer)
  The height of the MicroMessagingBookmarklet link window in pixels.

- **PopupWidth** (Integer)
  The width of the MicroMessagingBookmarklet link window in pixels.

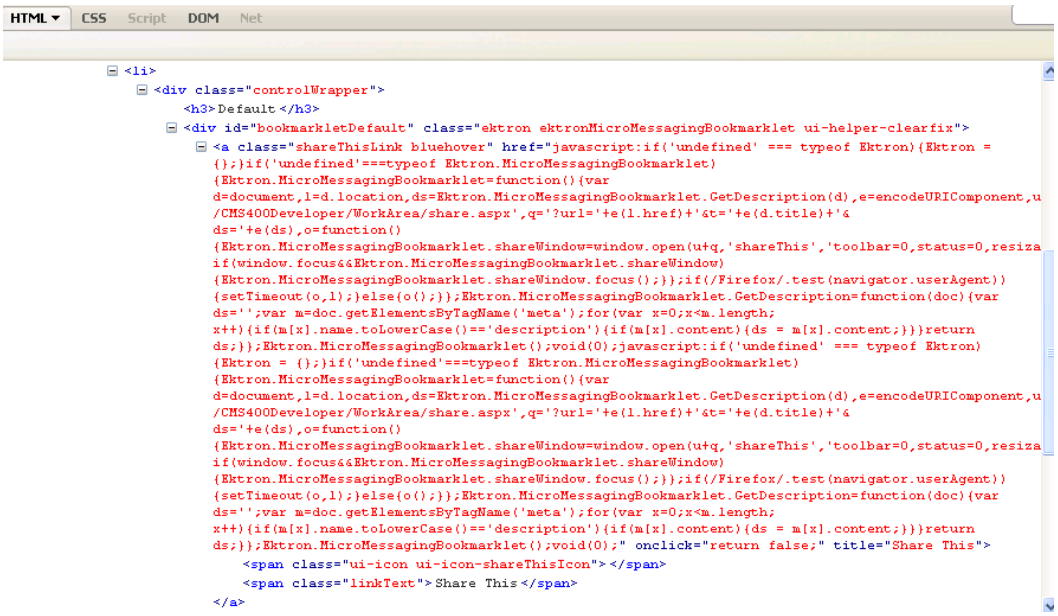
- **SiteName** (String)
  The name of the website using this server control. The SiteName value is embedded in the instructions for adding the MicroMessagingBookmarklet to the toolbar. See example below.



Customizing the MicroMessagingBookmarklet server control

The MicroMessagingBookmarklet server control is template-based which means you can change the control's appearance without an extensive XSLT or EkML file.

The JavaScript used to render the MicroMessagingBookmarklet control is loaded into the `Href` property of the control's anchor tag.



The following code shows the first MicroMessagingBookmarklet server control in `bookmarklet.aspx`.

```
<li>
<div class="controlWrapper">
<h3>Default</h3>
<CMS:micromessagingbookmarklet ID="bookmarkletDefault" runat="server" />
</div>
</li>
```

Because MicroMessagingBookmarklet is a templated server control, you can enter any valid markup, and it will be rendered exactly as you entered it. As examples, you can enter the following items within the `<div>` tags that surround the control.

- another Ektron server control
- any third-party server control
- HTML syntax
- databinding syntax
- style classes
- style tags, such as `<strong>`

PhotoGallery

8.50 and higher

IMPORTANT: Deprecated. The PhotoGallery server control is deprecated. If you are already using a deprecated item, you can continue to do so, but Ektron recommends using current versions of functionality.

The PhotoGallery server control helps users and community groups track and manage images.

Inserting the PhotoGallery server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

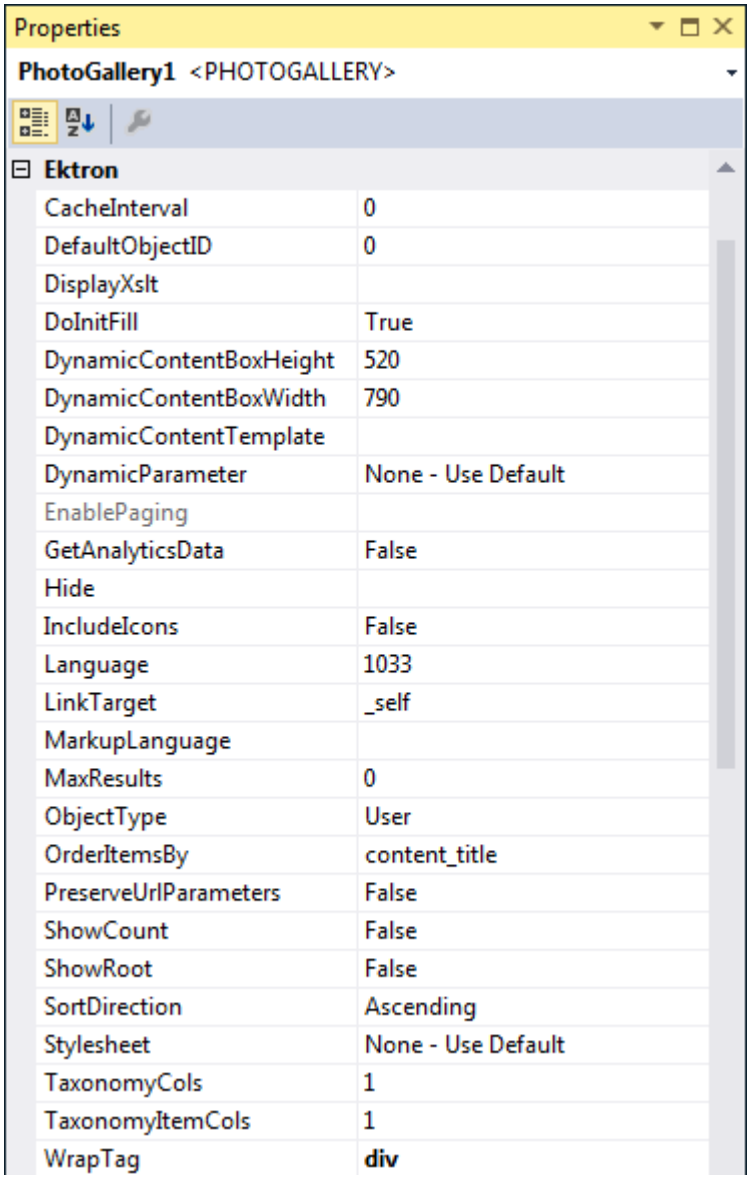
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **PhotoGallery** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:PhotoGallery ID="PhotoGallery1" runat="server" />
   ```

4. Click on `PhotoGallery` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



PhotoGallery properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultObjectID** (Long)

  The default object ID for this control to use when there is no matching dynamic parameter value passed.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicContentBoxHeight** (Integer)

  The height of the dynamic content box in pixels.

- **DynamicContentBoxWidth** (Integer)

  The Width of the dynamic content box in pixels.

- **DynamicContentTemplate** (String)

  The template to use when displaying dynamic content. Leave blank to use the dynamic box.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank.

- **EnablePaging** (Boolean)

  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.

- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeIcons** (Boolean)
  Choose whether to display icons next to the navigation list's links.

  - **True**. Show icons
  - **False**. Hide icons
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **LinkTarget** (String)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633
- **MaxResults** (Integer)
  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space, enter the maximum number of results per page here. Then, set the **EnablePaging** property to **True**. If you do and more than the number of **MaxResults** are available, navigation aids help the site visitor view additional items.
- **ObjectType** (String)
  The type of object to which this control is assigned. Choices are:

  - User
  - Group
- **OrderItemsBy**

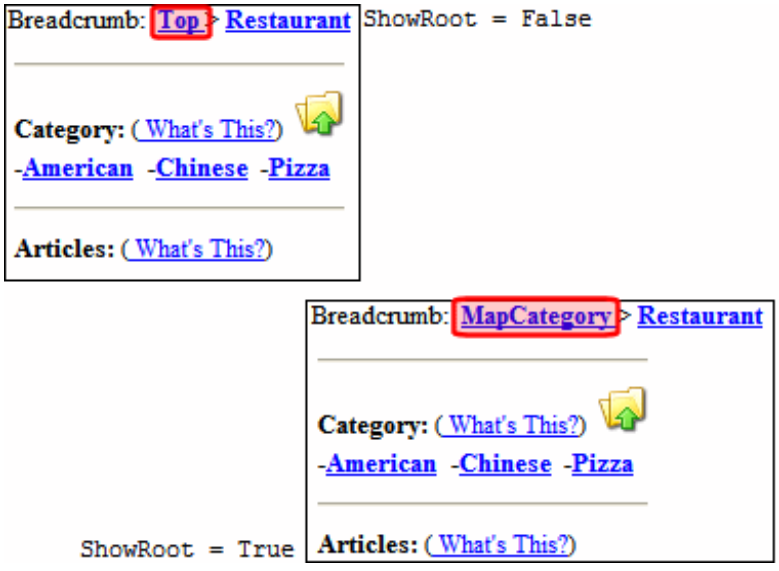
  Specify the sort order of results. Choices are:

  - **taxonomy_item_display_order**. The order of taxonomy items as set in the Workarea. For additional information, see Reordering Content Assigned to a Taxonomy Category.
  - **content_title**. Alphabetical order by title
  - **date_created**. Chronological order by date created
  - **last_edit_date**. Chronological order by date edited

  To specify the direction of the items, use the `SortDirection` property.
- **ShowCount** (Boolean)

  Indicates if an integer representing the number of taxonomy items in the category appears next to each category when displayed on the website. The default is False.

  - **True**. Show taxonomy items number
  - **False**. Do not show taxonomy items number
- **ShowRoot** (Boolean)
  - **False. Top** represents the first node of the taxonomy path.
  - **True**. The *name* of the taxonomy path's first node appears instead of **Top**.



- **SortDirection** (String)

  Select the direction of the `itemSortOrder` property. Choose Ascending or Descending.
- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder

outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

- **TaxonomyCols** (Integer)
  Enter the number of columns in which this taxonomy/category appear on the page.
- **TaxonomyItemCols** (Integer)
  Enter the number of columns in which the taxonomy items appear on the page.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Using the PhotoGallery server control

IMPORTANT: The PhotoGallery server control is deprecated. If you are already using a deprecated item, you can continue to do so, but Ektron recommends using current versions of functionality.

The PhotoGallery server control helps users and community groups track and manage images. They can organize the images in any number of taxonomy categories. For example, a user might have the following organization.

- Science
  - Biology
    - Animals
      - Mammals
        - Lions
        - Bears

After you upload an image to the a Photo Gallery, site visitors can navigate through its taxonomy and view the image.

When you associate this control with a community group, you can allow group members to add, remove and control the sharing of folders in a workspace. Because this feature is implemented on a group-by-group basis, it is controlled in the Workarea's **Edit Community Group** screen. See also: Allowing Community Group Members to Work with Folders.

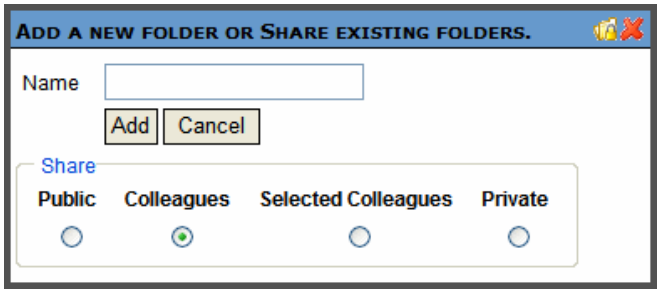
Categories

This section contains the following topics.

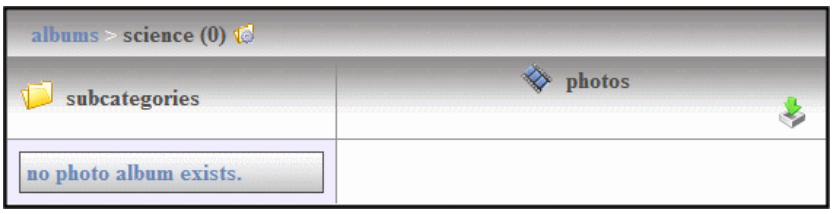
Adding a category

You can add categories to your photo gallery to sort your photos. You also can use categories to identify the types of users who can view the photos. For example, one category of photos may be private, while another may be shared with all of your colleagues.

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Click **Manage Folder** ( ). The Add box appears.



3. Enter a **Name** for the folder.
4. In the **Share** area, select with whom you want to share your photos.
   - **Public**. Anyone who can access your profile
   - **Colleagues**. Only colleagues (either you accepted their invitation, or they accepted yours)
   - **Selected Colleagues**. Colleagues that you designated as *selected*. See also: *Designating a selected colleague* on page 2266.
   - **Private**. Only you
5. Click **Add**. When the page refreshes, it opens to the newly added folder.



Renaming a category

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Click **Edit** ( ), located to the left of the category's title. The Edit box appears.

3. Change the name of the category.
4. Click **Save**.

Deleting a category

WARNING! Deleting a category permanently deletes all photos, as well as its subcategories.

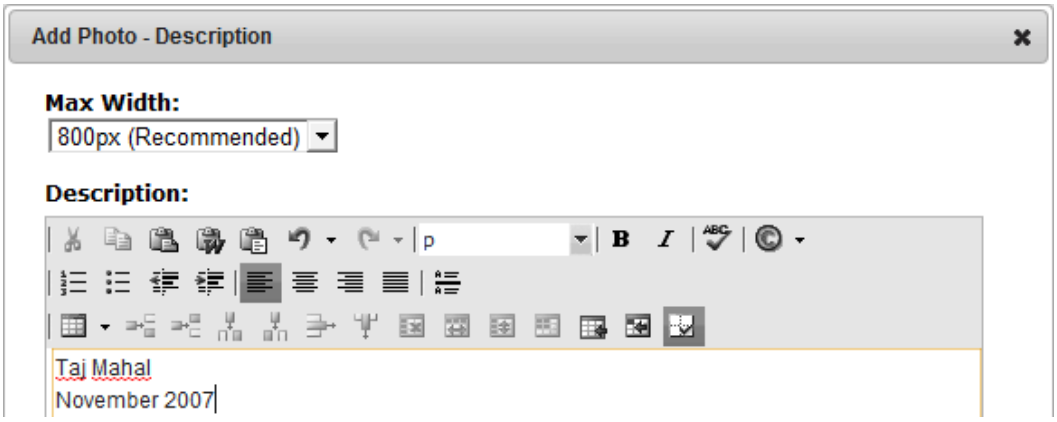
NOTE: You can not delete the top-level folder, Albums.

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Click **Edit** (), located to the left of the category's title. The Edit box appears.
3. Click **Delete**. A dialog box appears asking you to confirm.
4. Click **OK**.

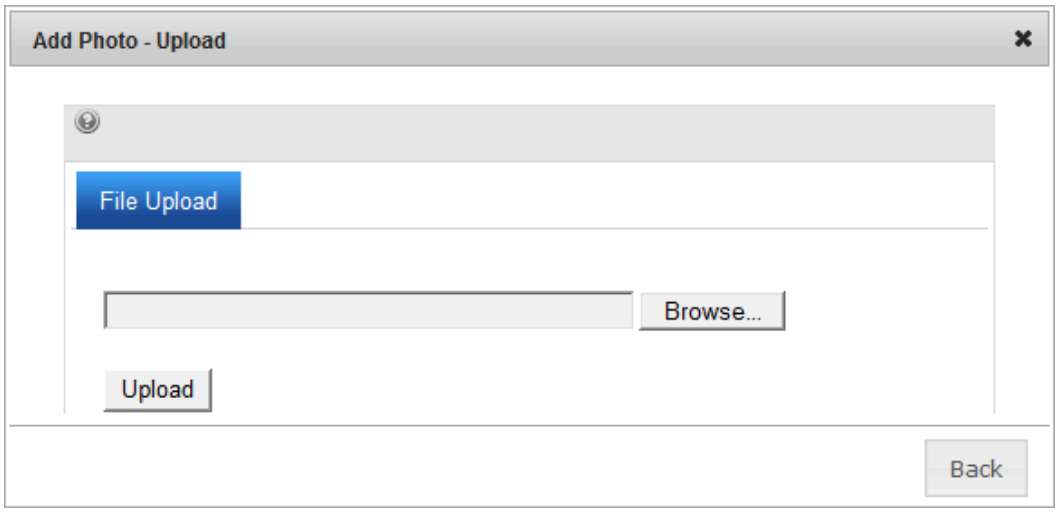
Photos

Adding Photos to a photo gallery

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Select a category where the photo will be added. If you want to create a new category, see *Adding a category* on the previous page
3. Click **Add Photo**. The Add Photo box appears
4. In the Photo Data area, enter a Description and Maximum Width.



5. Click **Next**. The Add Photo dialog appears. Its appearance varies according to your browser, as explained in Storing External Files as Library Items vs. Assets.



6. User the **Browse** or **Choose File** button to navigate to the photo in your file system. Or, you may be able to click the **Drag Drop** tab and drop a photo in the Add box. A status box shows the files being uploaded. The page refreshes, and the photo appears in the gallery.

Changing a photo title or description

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Select the category which contains the photo you want to change.
3. Click the triangle to the right of the photo's title and choose **Edit Properties**.
4. Edit the photo's Title, Description, or both.
5. Click **Save**.

Moving and copying photos

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Select the category from which to move or copy the photo.
3. Click the triangle to the right of the photo's title and choose **Copy**.
4. Select the category to which the photo will be moved and click **Manage**.
5. Click **Move** or **Copy**. A dialog box asks you to confirm the action.
6. Click **OK**.

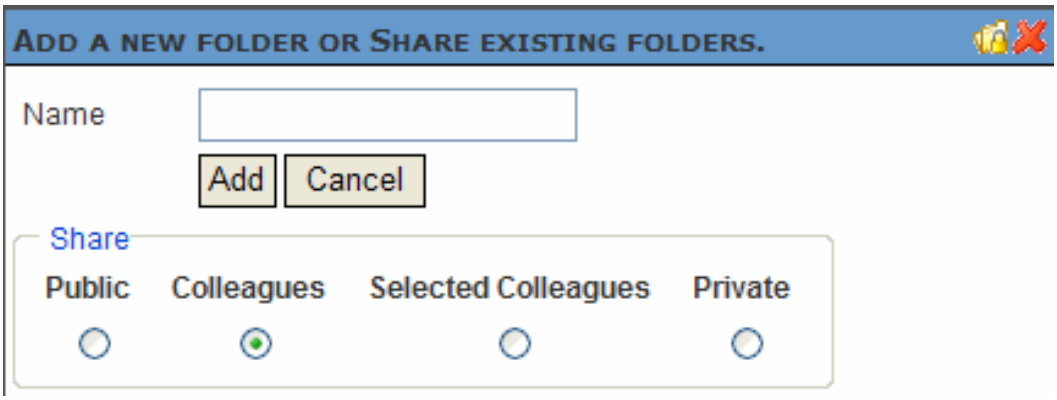
Deleting a photo

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Select the category which contains the photo you want to delete.
3. Click the triangle to the right of the photo's title and choose **Delete**. A dialog box asks you to confirm.
4. Click **OK**.

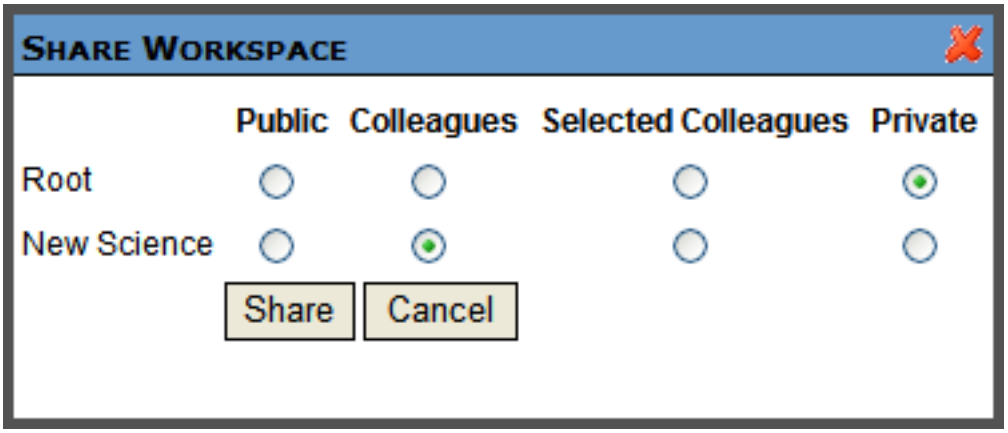
Sharing photos

The Photo Gallery lets you share photos with your colleagues. You can share photos with the Public, Colleagues, Selected Colleagues, or keep them private. You apply sharing options to categories, not individual photos. See also: *Public. Anyone who can access your profile* on page 2308

1. On the website, navigate to a user's **Profile Page > Photo Gallery**.
2. Click **Manage Folder** ( ). The Add box appears.



3. Click **Share Folder** ( ). The Share Workspace box appears.



4. Select with whom to share your photos.
   - **Public**. Anyone who can access your profile
   - **Colleagues**. Only colleagues (either you accepted their invitation, or they accepted yours)
   - **Selected Colleagues**. Colleagues that you designated as *selected*. See also: *Designating a selected colleague* on page 2266.
   - **Private**. Only you
5. Click **Share**.

Saving a photo to your local system

1. On the website, navigate to a **User's Profile Page > Photo Gallery**.
2. Select the category that contains the photo you want to save.
3. Click the triangle to the right of the photo's title and choose **Save As...** A dialog box asks you to open or save the file.
4. Click **Save**.

SocialBar

8.50 and higher

The SocialBar server control lets users of a community website bookmark colleagues, community groups, and content.

Inserting the SocialBar server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

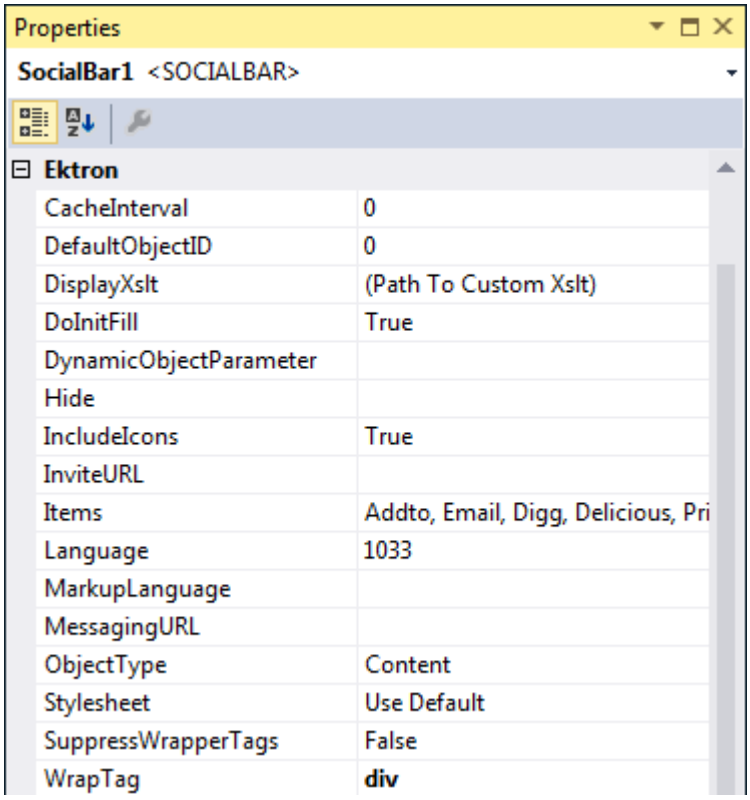
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **SocialBar** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:SocialBar ID="SocialBar1" runat="server" />
   ```

4. Click on `SocialBar` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



SocialBar properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultObjectID** (Long)

  The default object ID for this control to use when there is no matching dynamic parameter value passed. If you set this property set to 0 (zero) and leave the DynamicObjectParameter blank, the social bar can be used to add Web pages to your favorites.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicObjectParameter** (String)
  Gets or sets the QueryString parameter to read a object ID dynamically. To use the default object ID, leave blank.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IncludeIcons** (Boolean)
  Select whether icons are displayed next to each item.
  - **True**. Display icons next to each item.
  - **False**. Do not display icons next to each item.
- **InviteURL** (String)
  The URL to the Invite server control's Web page. Two variables used within the URL.
  - **{0}**. Object ID
  - **{1}**. Object type

  The link must have both variables. The Web form can be relative or absolute. Below is an example.

```
invitepage.aspx?id={0}&type={1}
```

- **Items**(String)
  A comma-separated list of items that you want to appear on the Social Bar.
  - Add to.
    - If this control is associated with a *user*, the Addto item appears as:
      - **Add a Colleague**. If you are viewing another user's profile page and can add them as a colleague.
      - **CancelColleague Request**. If you are viewing another user's profile page who you asked to be a colleague but the user has not yet accepted.
      - **Remove From Colleagues**. If you are viewing a current colleague's profile page.
    - If the control is associated with a *community group*, the Addto item appears as:
      - **Join Group**. If you visit a community group that you have not joined.
      - **Leave Group**. If you already belong to a community group.

        - **CancelRequest to Join**. If you have tried join a restricted group and have not yet been accepted.
    - If the control is associated with *content*, the Addto item appears as:
        - **Add to Favorites**. If you view content that is not in your Favorites.
        - **Remove Favorites**. If you view content that is in your Favorites.
  - **Invite**. A link to the Web page that contains the Invite server control. This control lets you invite people to register on the site and become a colleague.

    IMPORTANT: For the Invite item to be active, you must enter a link to the page hosting the Invite control into the `InviteURL` property.

  - **GroupInvite**. Opens a dialog that invites colleagues or people who are not registered on the site to join the group.
  - **Email**. Email this Web page. Clicking this item launches your email with the subject and body loaded with the information about the content, user or community group.
  - **Digg**. Appears as **Digg It**. Launches `Digg.com`, a social bookmarking service.
  - **Delicious**. Launches `https://del.icio.us`, a social bookmarking service.
  - **Facebook**. Appears as **Facebook**. Launches Facebook, a social network service.
  - **Google**. Appears as **Google It**. Launches Google's social bookmarking service.
  - **Furl**. Appears as **Furl It**. Launches Furl, a social bookmarking service.
  - **Technorati**. Appears as **Technorati**. Launches Technorati, a social bookmarking service.
  - **Twitter**. Launches Twitter, a social network service, which lets you communicate with other Twitter users. If the Twitter link is clicked, and you log into a Twitter account, a link to the current page is inserted into the Status box.
  - **Yahoo**. Appears as **Yahoo! It**. Launches Yahoo's social bookmarking service.
  - **Print**. Print the Web page.
  - **PrivateMessageUser**. Creates a link that lets you send a Private Message to a user. See also:
  - **PrivateMessageAdmin**. Creates a link that lets you send a Private Message to a community group's administrator. See also: .

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633*Ektron Markup Language* on page 2633
- **MessagingURL** (String)
  The Web page that hosts the Messaging server control. This property is used when either `PrivateMessageUser` or `PrivateMessageAdmin` appears in the **Items** property.

  If a value appears in the `ek_RedirectFromLoginKeyName` key in the `web.config` file, the user is returned to the original URL after sending the message. By default, this value is `RedirectUrl`. If you remove this value and do not add another, the person sending a message sees a note stating "Your message has been sent."
- **ObjectType**
  The type of object to which this control is assigned. Choices are:
  - Content
  - User
  - Group
  - **Data Type**. Ektron.Cms.Common.EkEnumeration.CMSSocialBarType**s**
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.

- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

Using the SocialBar server control

The SocialBar server control lets users of a community website bookmark colleagues, community groups, and content. The following table explains the details.

Item being bookmarked	Description
Users	• Sends colleague requests • Removes colleagues when a user visits another user's profile page
Group	• Join and leave community group • Invite others to join group
Content	Add or remove content and URLs from a user's Favorites. See also: *Favorites* on page 2254

The Social Bar control also is used to bookmark Web pages with Social Bookmarking services, such as Digg.com or del.icio.us. By default, Digg.com and del.icio.us are loaded in the `Items` property of the server control.

In addition, the Social Bar control can print or email a Web page, and invite non-site users to become members of the site. Clicking **Invite** links to a Web page that hosts the Invite server control. See also: *Invite* on page 2267.

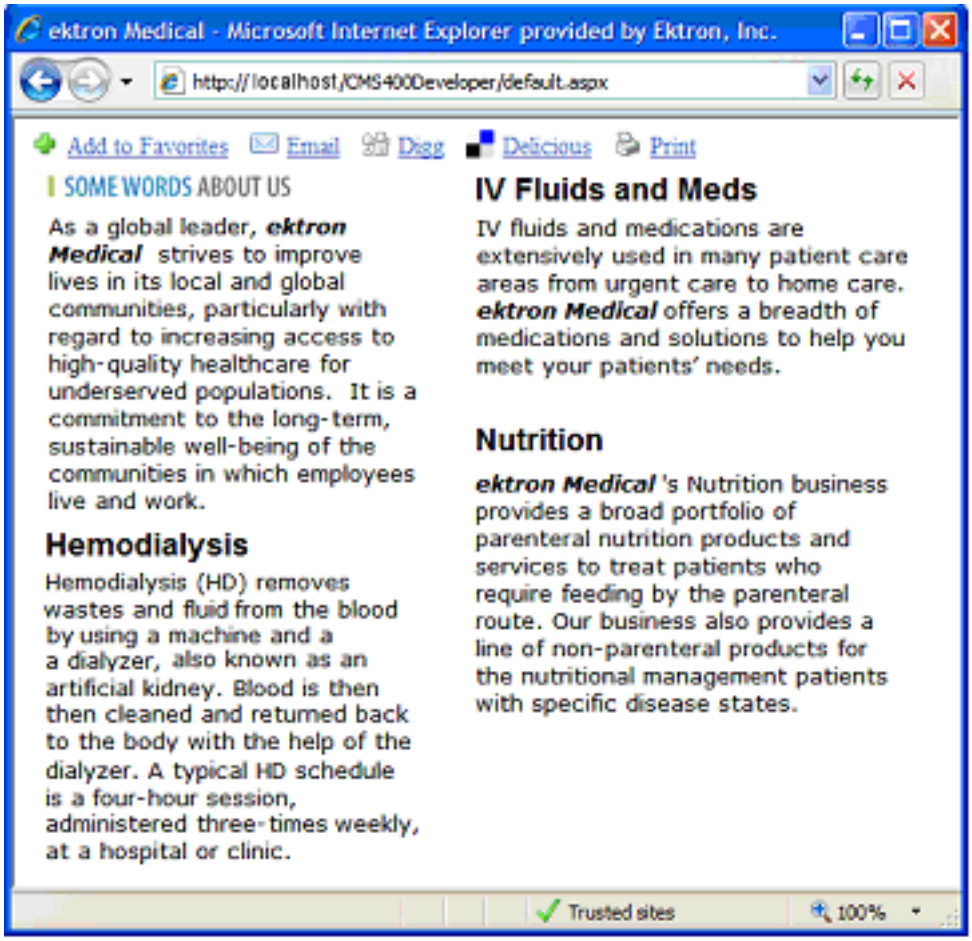
Adding a Web page URL to a favorites via the social bar

You can let users add a Web page's URL to their Favorites when they click **Add to Favorites** on the Social Bar. Typically, you would do this if more than one content item appears on a Web page, but you want only one Social Bar control on the page.

1. Drag and drop a SocialBar server control on a Web form.
2. Set the `DefaultObjectID` property to **0** (zero).
3. Leave the `DynamicObjectParameter` property blank.
4. If it is not already there, copy the comma-separated list of items from the `Items` property to the **Addto** item property.
5. Set the `ObjectType` property to **Content**.

The image below shows a Web page with several content items. A Social Bar control is associated with each one. In this example, when a you click **Add to Favorites**, you add the associated *content item* to your Favorites.

In the second image, one Social Bar appears on the Web page with several content items. In this example, if you click **Add to Favorites** on the Social Bar, you add the Web page's *URL* to your Favorites.



See also: *Adding a URL to your favorites* on page 2258

Sending a private message from the social bar

You can send private messages to another user or the community group administrator from the Social Bar control.

1. Drop a SocialBar server control on a user's profile or community group's page.
2. Set the `ObjectType` property to User or Group.
3. Add either **PrivateMessageUser** or **PrivateMessageAdmin** to `Items` property.
   - Use `PrivateMessageUser` to let a user send a message to the user whose profile is being viewed.
   - Use `PrivateMessageAdmin` to let a user send a message to the group administrator.
4. In the `MessagingUrl` property, identify a page that contains the Messaging server control. See also: *Messaging* on page 2276.
5. Make sure the `DynamicObjectParameter` is set, if necessary.

Tweeting the current URL

You can let site visitors use Twitter to tweet their current browsing location by adding the Twitter item to the list of parameters in the SocialBar's `Items` property.

After the item is added, a Twitter icon and link appear in the Social Bar. When you click the link, Twitter is launched. After you log into your Twitter account, your current browsing location appears in the "What are you doing?" status box. You then can click Twitter's **Update** button to post the status.

1. Drag and drop a SocialBar server control on a Web form.
2. Make sure the `DefaultObjectID` property is set to **0** (zero).
3. Leave the `DynamicObjectParameter` property blank.
4. If it is not already there, add the **Twitter** item to the comma-separated list in the `Items` property.
5. Set the `ObjectType` property to **Content**, **User** or **Group**, depending on the type of page you are editing.

TagCloud

8.50 and higher

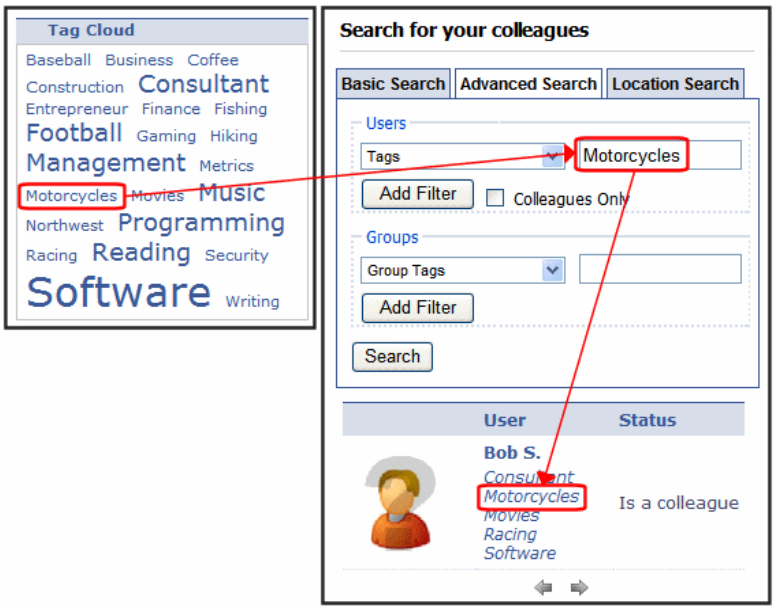
The TagCloud server control shows a weighted list of tags assigned to users, community groups, content, or library items. Tag sizes are proportional to the number of times they are assigned. For example, there are 2 tags, *Software* and *Programming*. If the *Software* tag is used 5 times and the *Programming* tag is used 2 times, the *Software* tag is approximately twice as large.

Use the `TagType` property to determine which types of tags appear in the cloud. For example, set `TagType` to `User` to display user tags.

You can set a maximum number of tags to display via the `MaxTagsDisplayed` property. This property makes sense if the `Orderby` property is set to `Taggedcount`. In this case, the cloud only displays items with the highest number of tags.

Use the `OrderBy` property to sort tags within a cloud. Your choices are `alphabetical` or by `Taggedcount` (the number of times an item is tagged). Then, use the `OrderByDirection` property to determine if items are sorted in ascending or descending order.

Within a tag cloud, you can link tags to their source items. If you do, site visitors can click a tag to launch a search of all users, community groups, content, or library items to which the tag is assigned. For example, if someone views a user-based tag cloud and clicks **Motorcycles**, the community search page appears, showing all users tagged with Motorcycles.



To make a tag cloud's items searchable, add a path to the Web form containing the Search server control in the `TagTemplate` property.

Inserting the TagCloud server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

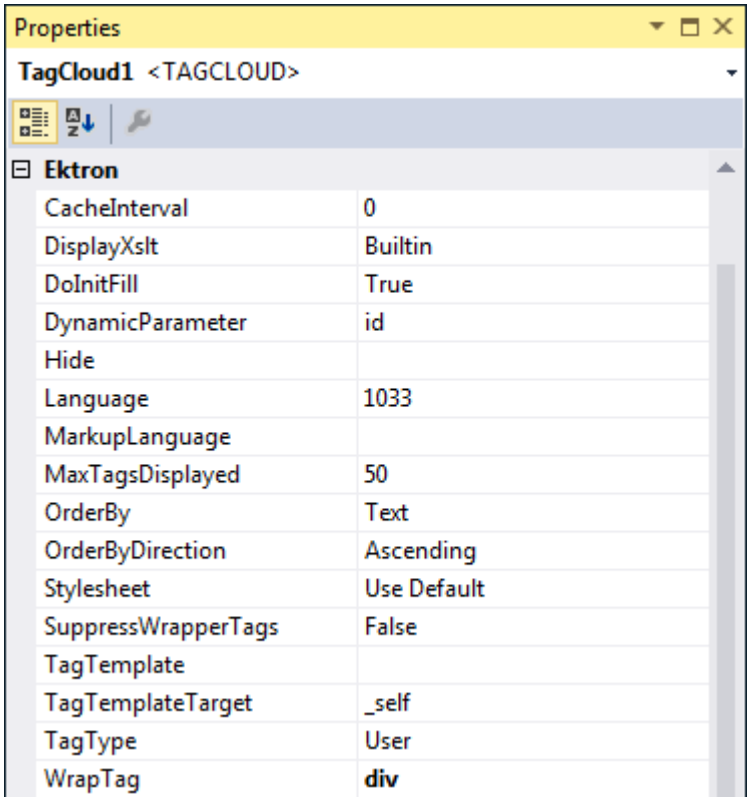
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **TagCloud** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:TagCloud ID="TagCloud1" runat="server" />
```

4. Click on `TagCloud` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



TagCloud properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)
  By default, the `TagTemplate` property passes a `TagId` parameter, whose value is the tag that a site visitor clicked in the tag cloud. Use this property to manually override that parameter and set the TagID value by hand.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)(missing snippet link)
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633*Ektron Markup Language* on page 2633
- **MaxTagsDisplayed** (Integer)
  The maximum number of tags to display. 0 (zero) = unlimited. If you set a maximum, and more than that number of tags are applied, then only the most frequently-used tags appear. For example, if you enter ten, the ten tags applied the most number of times appear.
- **OrderBy** (String)
  The criteria by which tags are ordered in the tag cloud. Choices are:
  - **TaggedCount**. Sort by how many times a tag is assigned
  - **Text**. Sort alphabetically by tag name
- **OrderByDirection** (String)
  Select the direction of the `OrderBy` property. Choose Ascending or Descending.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.

- **True**. Suppress wrap tags.
- **False** (default). Allow wrap tags.

- **TagTemplate** (String)

  If you want a tag cloud's items to link to a page that shows *all* items with that tag, add a path to a Web form page that hosts the appropriate search control. The path can be relative or absolute.

  - If the `TagType` is `User` or `Community Group`, enter a page hosting a Community Search server control.
  - If the `TagType` is `Content` or `Library`, enter a page hosting a templated search server control.

  For example, in the Ektron Intranet starter site's `tagcloud.aspx` page, the first 2 TagCloud controls link to users and community groups. So, this property is set to `CommunitySearch.aspx`, a Web form that hosts the CommunitySearch server control.

  When a site visitor clicks a tag cloud item, the Community Search page displays, populated with search results for the clicked tag. The visitor can click any result to see more about it.

  The following 5 parameters are added to the link's QueryString, and pass tag information to the destination Web form. Its search server control uses the parameters to populate the search.

  - **searchtag** or **searchgrptag**. Searchtag represents the tag's text for users; searchgrptag represent the tag's text for community groups
  - **TagId**. The clicked tag's ID
  - **TagLanguage**. The clicked tag's language; only search results in this language appear
  - **TagCount**. The number of times the tag has been assigned
  - **TagType**. The tag's type: user, community group, content or library item. This value is obtained from the `TagType` property (described below).

  In addition to these parameters, you can add your own by defining them in the path. If you do, the above 5 parameters are appended to yours.

- **TagTemplateTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **TagType** (String)
  Select the type of tags that appear in the tag cloud. Choices are:
  - User
  - CommunityGroup
  - Content
  - Library
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

UserProfile

8.50 and higher

A user's profile page is the person's home on the website. The UserProfile control displays following information about a user.

- Avatar
- Personal tags
- Screen name
- Custom properties
- If community aliasing for users is enabled, the user's alias (following **Profile**

Links)

Logged-in users can edit their profile by clicking **Edit Profile** in the top right corner. This dialog box is the same dialog that a membership user uses to create an account on the site. See Membership Users and Groups for a description of this dialog. To automatically create a friendly URL for a user profile, you can use Community Aliasing for Users. See also: Types of URL Aliasing.

Inserting the UserProfile server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

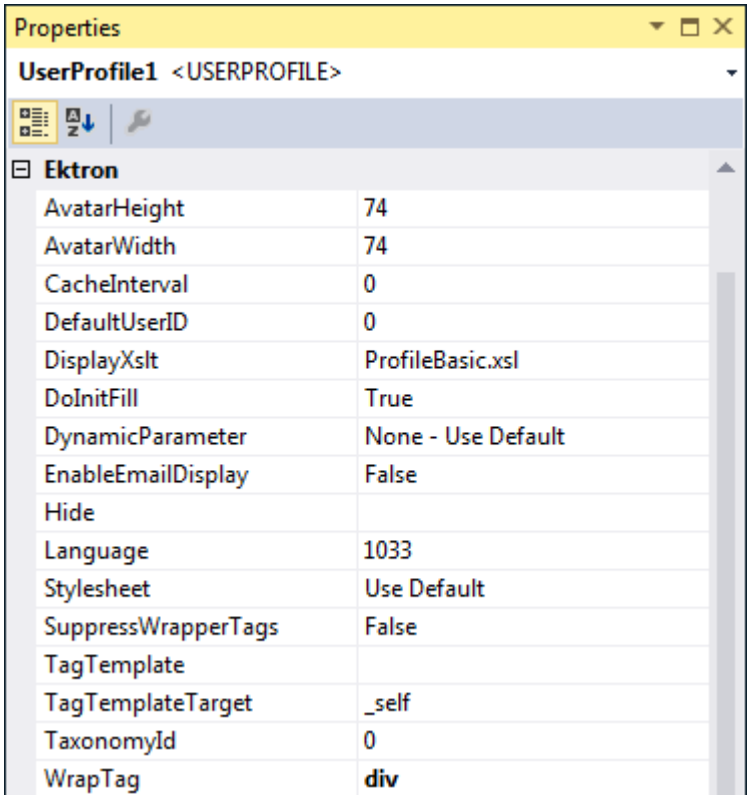
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **UserProfile** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:UserProfile ID="UserProfile1" runat="server" />
```

4. Click on `UserProfile` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



UserProfile properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AvatarHeight** (Integer)
  The display height in pixels of the avatar in the profile area.
- **AvatarWidth** (Integer)
  The display width in pixels of the avatar in the profile area.
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DefaultUserID** (Long)
  The default user ID for this control to use when there is no matching dynamic parameter value passed.
- **DisplayXslt** (String)
  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a user ID dynamically. To use the default object ID, leave blank.

- **EnableEmailDisplay** (Boolean)

  Set to True to display a user's email address in the profile. If a user's **Private Profile** setting is set to `Private`, the profile information is not visible, regardless of this property's setting. If **Private Profile** is set to `Colleagues`, only a user's colleagues can see email information.

  - **True**. Display a user's email address in the profile.
  - **False**. Do not display a user's email address in the profile.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TagTemplate** (String)

  The Web page template that contains the CommunitySearch server control. This allows users to search for others users with the same tags. If a template is entered, Personal Tags in the Profile appear as links. Clicking a tag forwards the user to a User Search page that displays search results for the matching tag.

- **TagTemplateTarget** (ItemLinkTargets)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **TaxonomyId** (Long)
  The numeric ID of the taxonomy that is available to users. A user editing a profile can select which categories to associate with their profiles. See also: Organizing Content with Taxonomies
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Content server controls

8.50 and higher

The Content server controls are as follows:

- *ContentBlock* below
- *ContentList* on page 2336
- *ContentReview* on page 2342

ContentBlock

8.50 and higher

IMPORTANT: Starting from release 8.6, the ContentBlock server control was replaced by the FrameworkUI: <ektron:ContentView> templated server control. If you are already using the ContentBlock server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The ContentBlock server control displays the following types of content blocks on an Web page.

- **Static**. Displays one specified content block
- **Dynamic**. Displays the content block of the ID passed through a URL parameter
- **XML**. Displays the content from the XML or XHTML code

Inserting the ContentBlock server control onto a page

PREREQUISITE

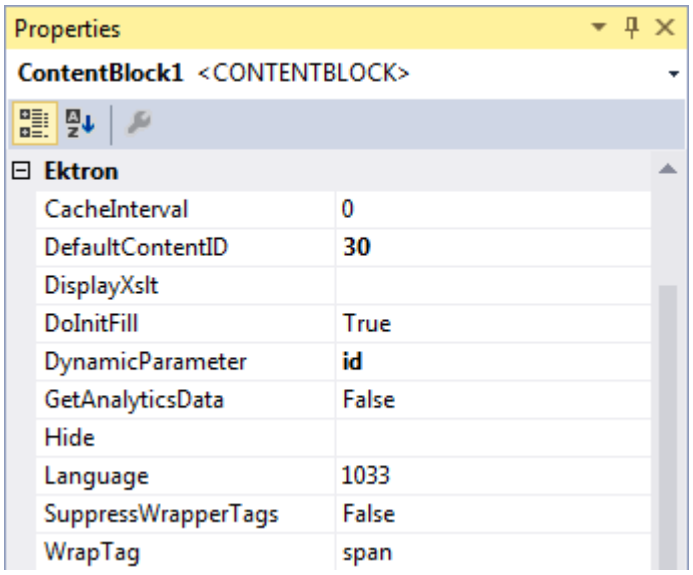
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ContentBlock** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:ContentBlock ID="ContentBlock1" runat="server" />
```

4. Click on `ContentBlock` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ContentBlock properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultContentID** (Long)

  The ID of a content block that appears where you insert this server control. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147.

NOTE: If you identify a content block that displays an Office document which will be published as HTML, make sure the template sets `<span>` tags to display the content as a block.

- **DisplayXslt** (String)
  Ignore for a non-XML content block.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Select **None - Use Default**. This parameter is used for dynamic content blocks.
- **GetAnalyticsData** (Boolean)
  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

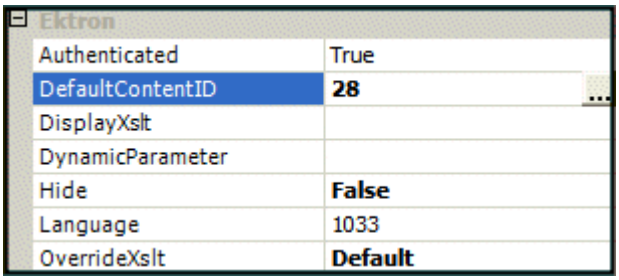
  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)

  IMPORTANT: If you want to let content authors edit this content using Ektron's Edit in Context feature, this must be set to false.

  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

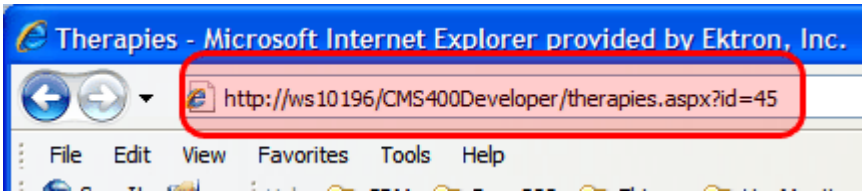
Using a static content block

A static content block displays one identified content block on a Web page. The following image shows a server control that retrieves content block ID=28 and displays it in the browser.

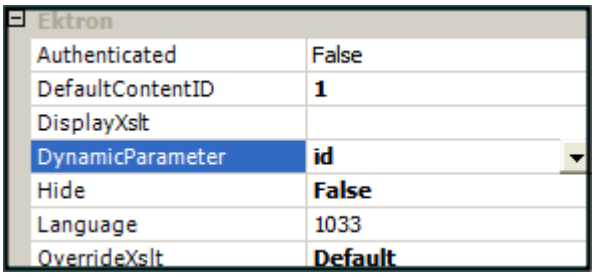


Using a dynamic content block

Use a dynamic content block to display a content block whose ID is passed through a URL parameter. You would use this server control with a dynamic template.



The following example uses the ContentBlock server control to pass the id as a URL parameter. When a user clicks a link that passes the content block ID as a URL parameter, that content block appears. If that content block is not available, content block 1 appears



The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

Dynamic ContentBlock properties

- **Authenticated** (String)

  Indicates if you are logged into the CMS Explorer and can use it to browse to content, collections, and so on. See also: *Browsing your Ektron site using CMS Explorer* on page 2147.

- **DefaultContentID** (Long)

  The ID of a content block that appears where you insert this server control. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

  NOTE: If you identify a content block that displays an Office document which will be published as HTML, make sure the template sets `<span>` tags to display the content as a block.

- **DisplayXslt** (String)

  Ignore for a non-XML content block.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Select **id**. When you do, this server control uses the content block passed as a URL parameter.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

  IMPORTANT: If you want to let content authors edit this content using Ektron's Edit in Context feature, this must be set to false.

- **WrapTag** (String)

  Lets a developer specify a server control's tag.

  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

XML ContentBlock properties

Use an XML content block to display an XML content block on an Ektron Web page.

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **Authenticated** (String)

  Indicates if you are logged into the CMS Explorer and can use it to browse to content, collections, and so on. See also: *Browsing your Ektron site using CMS Explorer* on page 2147.

- **CacheInterval** (Double)

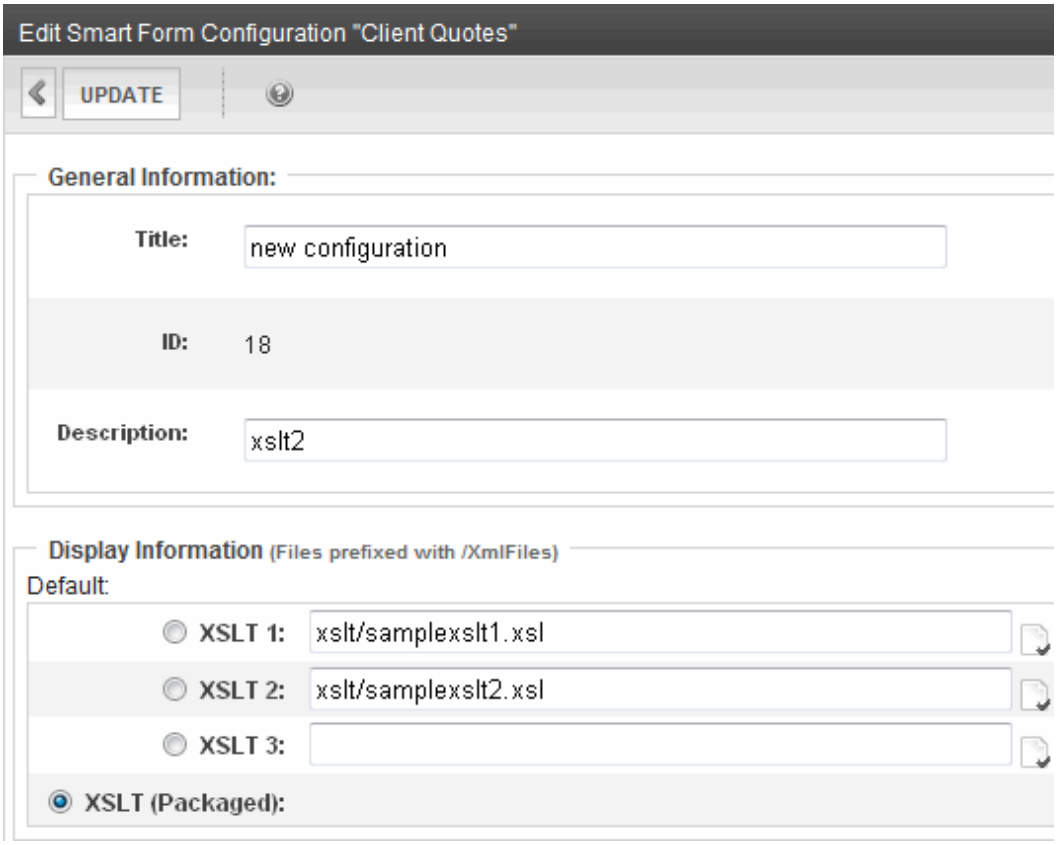
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultContentID** (Long)

  The ID of a content block that appears where you inserted this server control if no other content block is identified, or is not available. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. If you do not define the `DisplayXslt` property, the `OverrideXslt` property specifies an XSLT identified in the Edit Smart Form Configuration screen. See also: Working with Smart Forms, and the Ektron KnowledgeBase article "HOW TO:Add acceptable XSLT files to the system".



WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  To make this content block dynamic, select **id**. When you do, this server control uses the content block passed as a URL parameter.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Retrieving the XML structure of an XML ContentBlock

Retrieving the XML structure of XML content allows for greater control over developing XSLs. The following example shows how to retrieve the XML structure.

1. Open a new Web form.
2. Drag and drop a Content Block server control onto it.
3. Set the DefaultContentID to an XML content block.

IMPORTANT: This does not work with HTML content blocks, as there is no XML structure to output.

4. Drag and drop a textbox on the Web form.

5. Set the `TextMode` property to MultiLine.
6. It is also recommended that you set the width of the text box to at least 400 px.

   NOTE: On the code-behind page, add the following line.
   `TextBox1.Text = ContentBlock1.EkItem.Html`

7. Build the project.
8. View the form in a browser. The XML structure of the content block appears in the text box.

Using ContentBlock programmatically

The following code displays a content block:

NOTE: Before adding these lines of code, drag and drop a literal box on your Web form.

```
Dim MyContentBlock As New ContentBlock
  MyContentBlock.DefaultContentID = 8
  MyContentBlock.Page = Page
  MyContentBlock.Fill()
  Literal1.Text = MyContentBlock.EkItem.Html
```

To display a content block with the content block title:

NOTE: Before adding these lines of code, drag and drop a 2 literal boxes on your Web form.

```
Dim MyContentBlock As New ContentBlock
  MyContentBlock.DefaultContentID = 8
  MyContentBlock.Page = Page
  MyContentBlock.Fill()
  Literal1.Text = MyContentBlock.EkItem.Title
  Literal2.Text = MyContentBlock.EkItem.Html
```

ContentList

8.50 and higher

IMPORTANT: Starting from release 8.6, the ContentList server control was replaced by the FrameworkUI: <ektron:ContentView> templated server control. If you are already using the ContentList server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The ContentList server control displays a list of content blocks on a Web page. In contrast to a List Summary, where content must be in a specified folder, the ContentList server control displays content from any Ektron folder. Depending on the setting you choose for `DisplayXslt`, you can change information displayed for each content block.

When added to a template and visited, a ContentList Summary looks similar to the following.

The ContentList server control has the following options to display a content list.

- Define a content list in a content block's metadata. Then, assign that content block's ID in the `DefaultContentID` property.

  When using this option, an administrator typically sets up the Workarea portion of the process. Then, a developer adds the server control to a Web form and assigns the content block ID and the metadata name to the appropriate properties. Because the content list is assigned to a content's metadata, you can pass the content ID dynamically in a Web form and display a list for each content block you defined.

- Assign a comma-delimited list of content blocks to the `ContentIds` property. See also:

  Using the `ContentIds` process, a developer adds the ContentList server control to Web form. Then, the developer defines a list of content IDs in the `ContentIds` property. If the server control or the list in the `ContentIds` property is deleted, it is not available and will have to be created again.

Inserting the ContentList server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

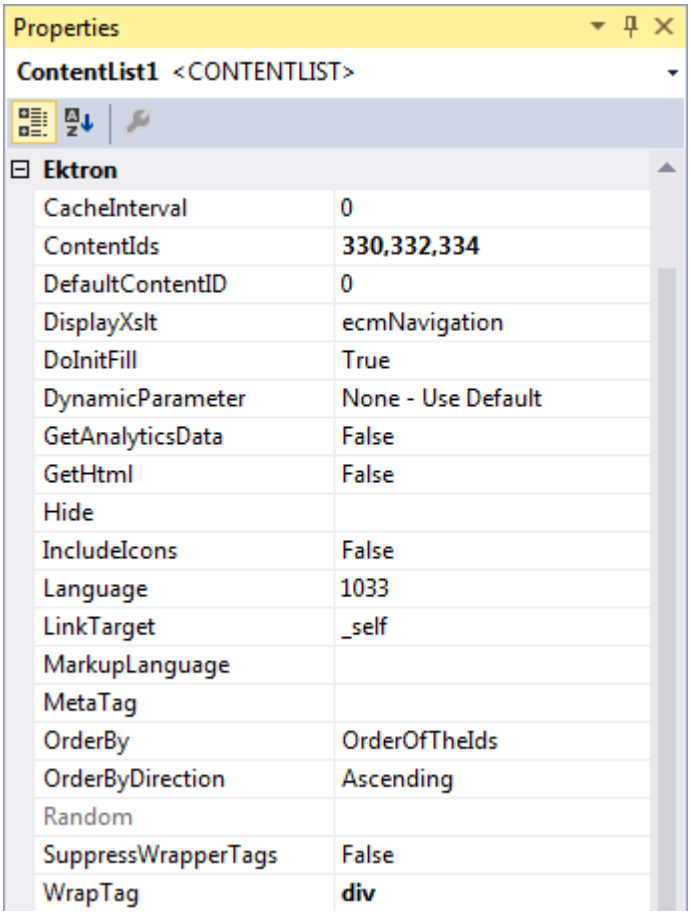
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ContentList** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:ContentList ID="ContentList1" runat="server" />
   ```

4. Click on `ContentList` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



ContentList properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **ContentIds** (String)
  A comma delimited list of content block IDs.
- **DefaultContentID** (Long)
  Set content ID value. When set, content IDs are generated from the MetaTag value for this content.
- **DisplayXslt** (String)
  Determines how information appears on the page.
  - **None**. Databind only
  - **ecmNavigation**. Lists the title of each content block.

- **ecmTeaser**. Lists the title of each content block plus the content summary.
- **ecmUnOrderedList**. Sorts the list in no particular order. Shows the title and content summary.
- **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

WARNING! If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Uses the QueryString parameter to read a content ID dynamically.

  - **None - Use Default**. Use the default content ID list.
  - **ID**. Reads a content block's ID dynamically.
  - **ekfrm**. Reads a form block's ID dynamically.

- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **GetHtml** (Boolean)
  - **True**. Retrieve and display content (html body) for all content blocks in the list summary. For example, to display content inside a Web server control such as a GridView.
  - **False**. Do not get and display HTML.
- **Hide** (Boolean)

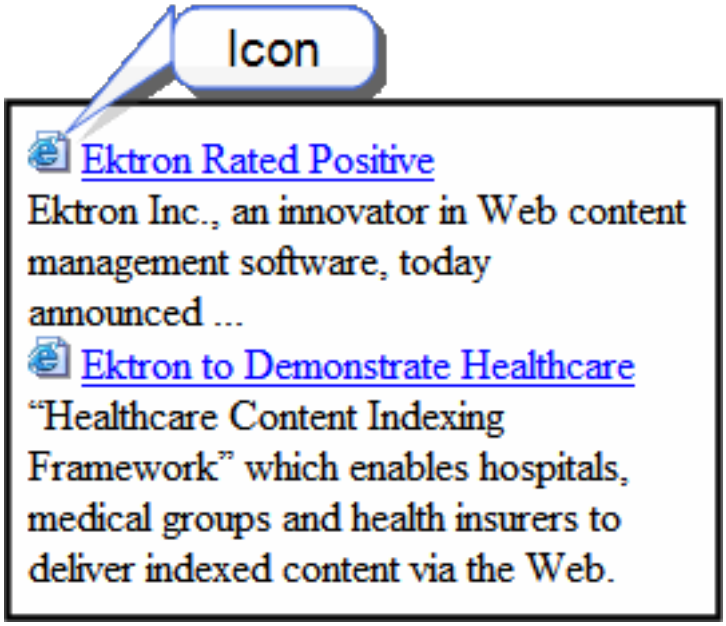
  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeIcons** (Boolean)

  Choose whether to display icons next to the content list's links.

IMPORTANT: This property works only when ecmSummary or ecmTeaser are used in the `DisplayXslt` property. When the `[$ImageIcon]` variable is used in an EkML file and that file is assigned to the `MarkupLanguage` property, this property acts as True.



- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633

  See also: *contentlist.ekml* on page 2635

NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.

- **MetaTag** (String)

  Specify a Metadata definition whose type is Content Selector. When you do, the associated list of content items will appear where you place the server control.

  NOTE: You cannot insert other metadata types.

  This works with the `DefaultContentID` property. For more information about using metadata to assign a list of related content to a content item, see Creating and Deploying a Related Content Definition.

- **OrderBy** (Ektron.Cms.Controls.CmsWebService.ContentListOrderBy)

  Sort the list by one of these values:

  - **Title**. Alphabetically, by content title
  - **DateModified**. The last date content was modified
  - **DateCreated**. The date content was created
  - **LastEditorFname**. The last editor's first name
  - **LastEditorLname**. The last editor's last name
  - **OrderOfTheIds**. Preserves content ID order based on `ContentIds` property
  - **ContentRatingAverage**. Business Analytics Content Rating
  - **ContentViewCount**. Business Analytics Content Views

- **OrderByDirection** (Ektron.Cms.Controls.CmsWebService.ContentListOrderByDirection)

  Determines which direction to sort content determined by the `OrderBy` property.

  - **ascending**. Items are arranged A, B, C or 1,2,3.
  - **descending**. Items are arranged. Z,Y,X or 3,2,1.

  If sorting by date, descending puts the most recent first. When `ascending` is selected and the `OrderBy` property is set to `OrderOfTheIds`, the order of the IDs are preserved. When set to descending, the order is reversed.

- **Random** (Boolean)
  - **True**. Randomly display one content block link from the content list. The content changes each time a user views the page.
  - **False**. Display the content list normally.

  NOTE: If you use a custom XSLT or EkML file, the type of content displayed can be manipulated. For example, if you use an EkML file that has the [$Html] variable in it, the actual content appears instead of a link. See also: *Ektron Markup Language* on page 2633 and *[$Html]* on page 2666

- **SuppressWrapperTags** (Boolean)

  This property is set to `false` because Ajax uses `<div>` tags to rewrite the region around the tag. You *cannot* change the value to `true`.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

ContentReview

8.50 and higher

The ContentReview server control lets site visitors rate content on your site. Place this control on a template that displays content items or eCommerce products. For example, you place this control on a Master page and set its `DynamicParameter` property to ID. Then, when a Web form containing a content item or product passes its ID to the QueryString, a site visitor can use the control to record a review.

You can use the ContentReview server control as follows:

- Place a star-based scale on a Web page. Site visitors use the scale to rate a content item. Depending on the XSLT, they can also submit review comments.
- Display reviews and comments about a content item, or by a specific site or membership user.

See also: User-Ranking of Content.

NOTE: On a PageBuilder page, you can insert a ContentReview server control using the Calendar widget. See also: Creating and Using Widgets. The eCommerce Product List server control also can display the star-based scale.

Inserting the ContentReview server control onto a page

PREREQUISITE

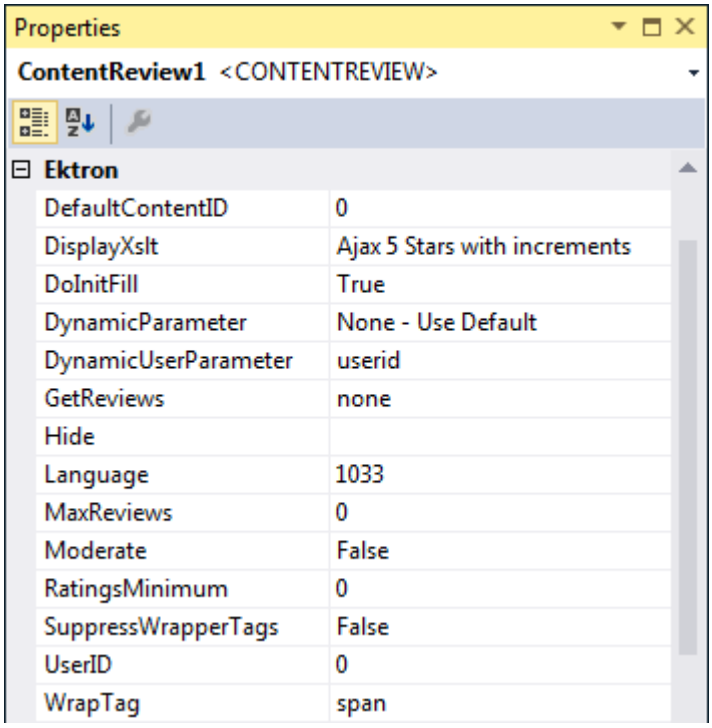
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ContentReview** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:ContentReview ID="ContentReview1" runat="server" />
   ```
4. Click on `ContentReview` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



ContentReview properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DefaultContentID** (Long)

  The ID of a content block being rated by this server control. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

- **DisplayXslt** (String)

  Select the type of review to display, or enter the path to a custom XSLT. For additional information, see *Using the DisplayXSLT property* on page 2345. Choices are:

  - **Ajax 5 Stars**. A 5-star rating system utilizing Ajax for display.
  - **Ajax 5 Stars Comment**. A 5-star rating system utilizing Ajax for display. When you hover over the stars, a comment box appears. Comments that are added are submitted via an Ajax call.
  - **Ajax 5 Stars with Increments**. A 5-star rating system with half star increments that utilizes Ajax for display.
  - **5 Stars**. A 5-star rating system that allows visitors to add text reviews of content.

- **5 Stars with Increments**. A 5-star rating system with half star increments that allows visitors to rate and add a text review of the page's content.
- **Review List. D**isplays a list of reviews for content or a user.
- **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  To make this content review control dynamic, select **id**. When you do, this server control is attached to the content block passed as a URL parameter.

- **DynamicUserParameter** (String)

  When using this control to retrieve a user's reviews, set this property to **UserId** to make the user's ID dynamic.

- **GetReviews** (ReviewTypes)

  Returns a list of reviews for content or a user.

  - **None**. Do not return reviews.
  - **Content**. Returns reviews based on the content ID provided in the `DefaultContentID` property.
  - **User**. Returns reviews based on the User ID provided in the `UserId` property.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **MaxReviews** (Integer)

  The number of reviews to retrieve if the `GetReview` property is set to Content or User. 0 (zero) = unlimited.

- **Moderate** (Boolean)
  Setting this property to True allows Ektron users to moderate reviews. See also: Moderating Reviews.
- **RatingsMinimum** (Integer)
  Sets a minimum number of reviews before displaying the average rating. When set to 0 (zero), the average rating appears as soon as content is rated.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **UserID** (Long)
  The user ID for which to get reviews. If left blank, reviews from all users are returned. If a user ID is specified, only reviews for that user are returned.

  IMPORTANT: The `GetReviews` property must be set to User for the control to use this property.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Using the DisplayXSLT property

Reviews communicate your site community's feelings about a product or article. They also give community members a voice. The ContentReview server control's `DisplayXSLT` property manages the display of reviews on your site. The control can display reviews for specific content or a specific user.

The following list shows an example of each XSLT as it appears on a Web page with a description and the XSL file being used. The files are located in *webroot*`\`*siteroot*`\Workarea\Xslt`.

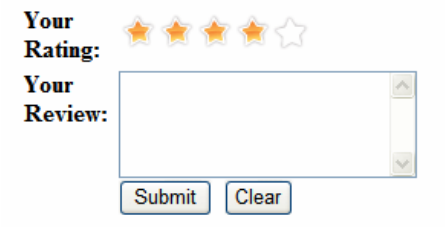
WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **Ajax 5 Stars**. `rating5star.xsl`. A 5-star rating system utilizing Ajax for display.

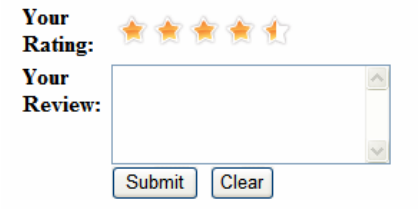
- **Ajax 5 Stars Comment**. `rating5starComment.xsl`. A 5-star rating system utilizing Ajax for display. When you hover over the stars, a review box pops-up. Visitor comments are submitted via an Ajax call.

- **Ajax 5 Stars with Increments**. `rating5starinc.xsl`. A 5-star rating system with half-star increments that uses Ajax for display.

- **5 Stars**. `rating5starAddEdit.xsl`. A 5-star rating system that lets visitors add text reviews of content.



- **5 Stars with Increments**. `rating5starincAddEdit.xsl`. A 5-star rating system with half star increments that allows visitors to add text reviews of content.



- **Review List**. `ratinglist.xsl`. Displays a list of reviews for content or a user.

Retrieving the XML structure of a ContentReview

Retrieving the XML structure of XML content allows for greater control over developing XSLs.

1. Open a new Web form.
2. Drag and drop a ContentReview server control onto it.
3. Set the `DefaultContentID` property.
4. Drag and drop a textbox on the Web form.
5. Set its `TextMode` property to **MultiLine**. You should set the width of the text box to at least 400px.

6. On the code-behind page, add the following line.
7. `Textbox1.Text = ContentReview.XmlDoc.InnerXml`
8. Build the project.
9. View the Web form in a browser. The XML structure of the collection appears in the textbox.

DesignTimeDiagnostic

8.50 and higher

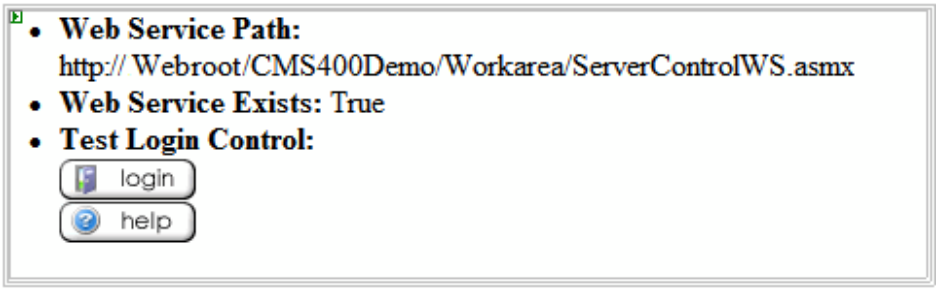
IMPORTANT: This control is for use in design-time only. Nothing is rendered at run-time.

The DesignTimeDiagnostic server control is used to verify the connection to Ektron's server controls Web services. When added to a Web form, this control provides the following information:

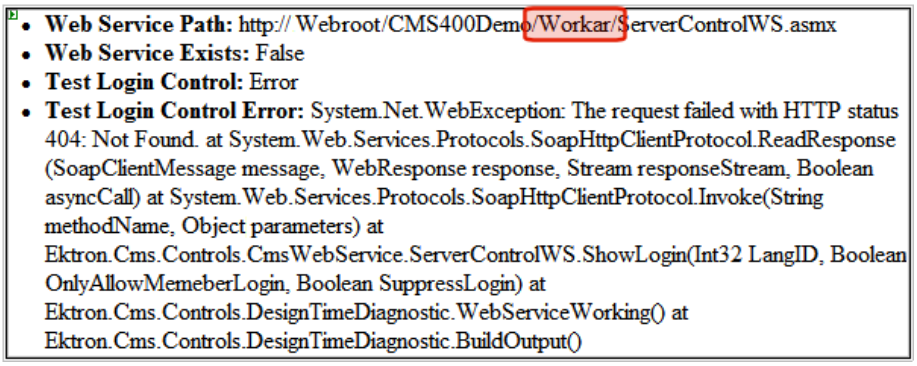
- **Web Service Path**. The server control Web service path in your web.config file.
- **Web Service Exists**. Calls a method in the Web service that returns **True** if the Web service exists. If it does not, it returns **False**.
- **Test Login Control**. Displays a Login server control to show that the Web service is connected and working properly. When not connecting properly, an error message appears.

The DesignTimeDiagnostic server control has no definable Ektron properties.

The following example shows the control on a page connected to the Web service.



The following example shows the control on a page not connecting to the Web service. Note that the path is not the correct path. It should be:
`http://192.168.0.82/siteroot/Workarea/ServerControlWS.asmx`



Inserting the DesignTimeDiagnostic server control onto a page

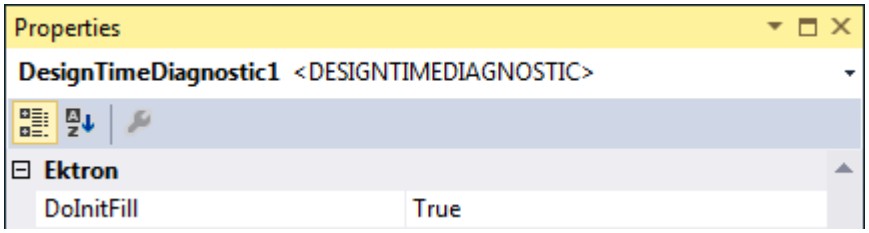
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **DesignTimeDiagnostic** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:DesignTimeDiagnostic ID="DesignTimeDiagnostic1" runat="server" />
```

4. Click on `DesignTimeDiagnostic` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



DoInitFill (Boolean)

By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

Directory

8.50 and higher

The Directory server control lets you customize the behavior of the taxonomy feature. You place this control on a Web form to display a taxonomy. See also: Organizing Content with Taxonomies.

NOTE: To display a taxonomy on a PageBuilder page, use the taxonomy summary widget.

To minimize taxonomy's impact on the performance of your production server, follow these guidelines.

- Use the default page size (50). If you need to customize page size, use Ektron's Developer Reference Sample SiteAPI, but do not increase it above 800.

- For large databases, do not increase the value of the `TaxonomyDepth` property above 1. Changing this value dramatically slows down your production server's performance. However, you can increase depth on your staging server for testing purposes.

Inserting the Directory server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

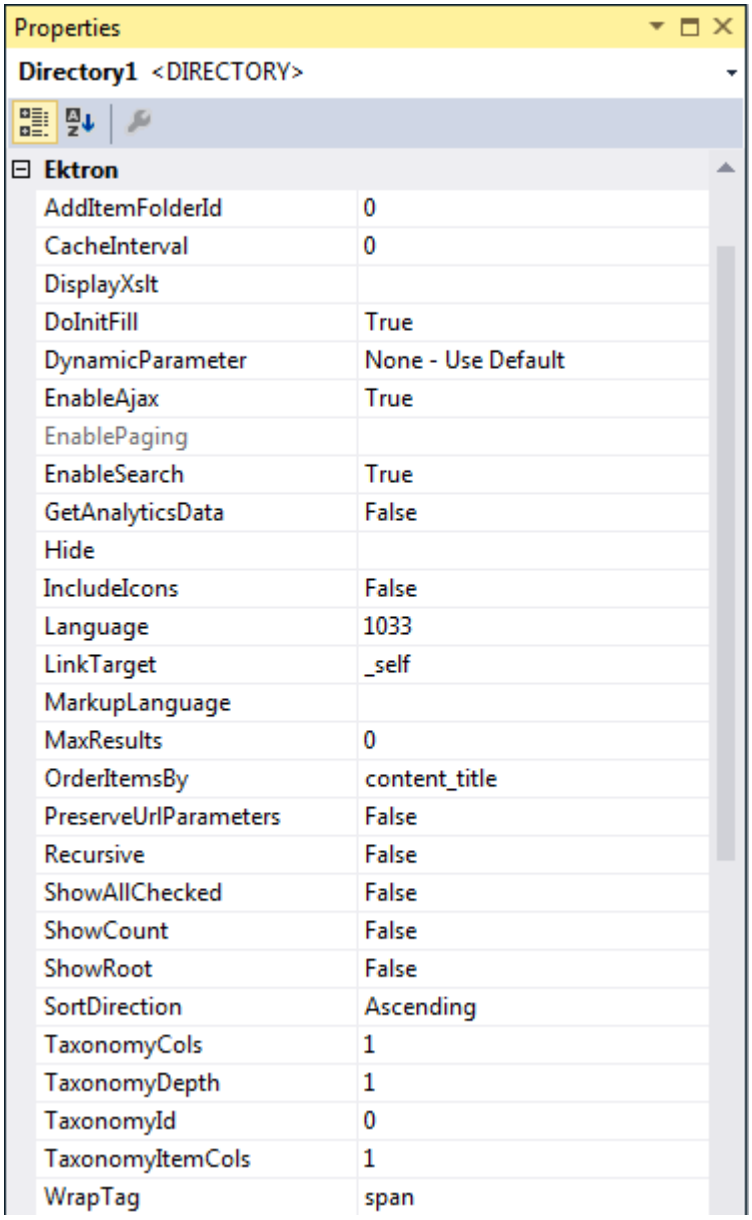
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Directory** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Directory ID="Directory1" runat="server" />
```

4. Click on `Directory` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



Directory properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddItemFolderID** (Long)

  Define the Ektron folder ID where content is stored when an item is added to the taxonomy via the Add Asset link or the Add Content link. To enable adding content items via the Directory server control, you must use an EkML file with the `[$AddAsset]` and `[$AddArticle]` variables. See also: *taxonomy.ekml* on page 2641.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

  NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID dynamically.

- **EnableAjax** (Boolean)

  Set to true to enable Ajax searches. When enabled, the `MaxResults` property determines the maximum number of results per page.

  - **True**. Enable Ajax Search (default value)
  - **False**. Original HTML Search

- **EnablePaging** (Boolean)

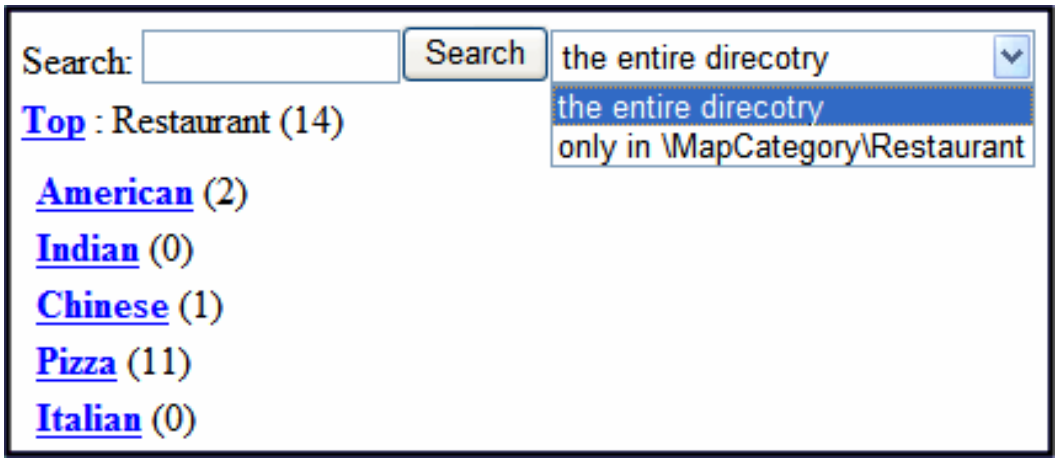
  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen. See example below.

So, for example, if a taxonomy has 9 items and `MaxResults` is set to 3, the screen displays only the first 3 items. When the site visitor clicks **[Next]**, he sees items 4, 5 and 6, and so on.

IMPORTANT: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **EnableSearch** (Boolean)

  Set to **True** if you want a search box (shown below) to appear above this taxonomy display. A site visitor can use the search to find content within a taxonomy/category that includes terms of interest. To suppress the search box, set to **False**.



- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeIcons** (Boolean)

  Choose whether to display icons next to the taxonomy's links.

  This property only works when ecmSummary or ecmTeaser are used in the `DisplayXslt` property. When the `[$ImageIcon]` variable is used in an EkML file and that file is assigned to the `MarkupLanguage` property, this property acts as True.

  - **True**. Show icons
  - **False**. Hide icons
- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

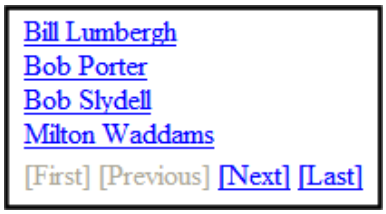
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633

  See also: *taxonomy.ekml* on page 2641

  NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.
- **MaxResults** (Integer)

  Enter the maximum number of items to appear in the initial display of this server control. If you set this value to zero (0), the maximum is 50. To let site visitors view more than the maximum but limit the amount of space being occupied, enter the maximum number of results per page here. Then, set the `EnablePaging` property to **True**. If you do and more than the number of `MaxResults` are available, navigation aids appear below the last item to help the site visitor view additional items. See following example below.

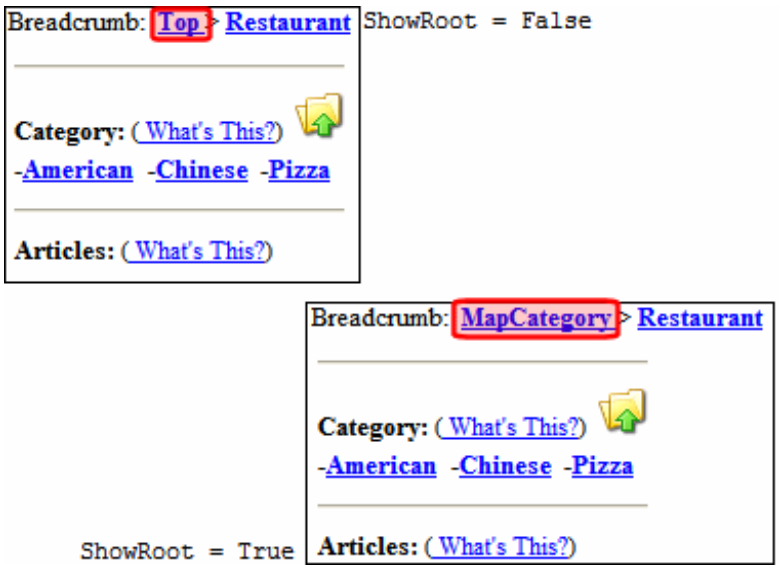


- **OrderItemsBy**
  Specify the sort order of results. Choices are:
  - **taxonomy_item_display_order**. The order of taxonomy items as set in the Workarea.
  - **content_title**. The content is listed in alphabetical order by title.
  - **date_created**. Content is listed in the order by which it was created.
  - **last_edit_date**. Content is listed in order, by its last edit date.
  - **content_rating_average**. Business Analytics Content Rating
  - **content_view_count**. Business Analytics Content Views

  Use the the `SortDirection` propertyYou can to specify the direction of the items with the `SortDirection` property.
- **PreserveUrlParameters** (Boolean)
  Set to `true` if this control needs to preserve the URL parameters on the page. For example, if a server control displays a list of content items, the URL parameter passes to the control the template names and `id` values that the template expects. Set to `false` if the server control does not need to pass the URL parameters to the server control. The default value is `false`.
- **Recursive** (Boolean)
  Set to True to include child folders of the parent folder.
- **ShowAllChecked** (Boolean)
  When set to `true`, a check box appears in the **Show All** check box.

  Also, set this property to `true` if you want categories to which no items are assigned to appear. If set to `false`, only categories to which items are assigned show up in the display.
- **ShowCount** (Boolean)
  Indicates if the number of taxonomy items appears next to each category when displayed in the website. (See example below.) Default value is false.

- **ShowRoot** (Boolean)
  - **False. Top** represents the first node of the taxonomy path.
  - **True**. The *name* of the taxonomy path's first node appears instead of **Top**.



- **SortDirection** (String)

  Select the direction of the `ItemSortOrder` property. Choose Ascending or Descending.

- **TaxonomyCols** (Integer)

  Enter the number of columns in which this taxonomy/category will appear on the page.

- **TaxonomyDepth** (Integer)

  Enter the number of taxonomy levels to retrieve below each taxonomy/category if you are accessing a taxonomy's XML using code-behind. For example, if the taxonomy is **Clients > Industries > Education > Colleges**, and you set **Taxonomy Depth** to **2**, only Clients > Industries are available in code-behind.

  Exception: If you set this value to 1, the control retrieves taxonomy levels to a depth of 2. For example, if the taxonomy is **Businesses > Restaurants > Fast Food > Pizza**, and you set **Taxonomy Depth** to **1**, Business and Restaurants are available in code-behind.

This setting has no effect on the display generated by the Directory server control, which always displays one level below the current. To retrieve all categories for a taxonomy recursively, enter -1. The default value is 1.

IMPORTANT: For a live site, leave this value at **1**. Increasing this value can slow down your live Web server. However, for testing on a staging server, you can increase the depth.

- **TaxonomyId** (Long)
  Enter the ID number of the taxonomy or category to appear in this server control. If you don't know the number, click the button and navigate to the taxonomy or category.
- **TaxonomyItemCols** (Integer)
  Enter the number of columns in which this taxonomy/category items (articles) will appear on the page.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

eCommerce server controls

8.50 and higher

Ektron provides a set of eCommerce server controls that let you set up an online marketplace where customers (site visitors) can purchase merchandise, services or content. Customers interact with these server controls on your site.

- *Cart* on page 2359. View products in a shopping cart, create new carts, and apply discounts.
- *Checkout* on page 2367. Check out.
- *CurrencySelect* on page 2381. Select a currency.
- *MyAccount* on page 2384. View and change their account information.
- *OrderList* on page 2390. View a list of processed orders.
- *Product* on page 2396. View a product's details and add it to their shopping cart.
- *ProductList* on page 2405. Search for products or view a list of products.
- *Recommendation* on page 2413. Get recommendations on other products.

Most eCommerce server controls let customers move from one control to another via template properties that let you define the location of another server control. For example, if you define the path to the Cart server control in the Product server control's TemplateCart property, customers are directed to the Cart control when they click the Product control's Add to Cart button.

Ektron's server controls let you insert standard methods and properties within the Visual Studio environment. This means that you can see the effect of your changes in real time; you don't have to modify a page and then compile to see results.

You can insert server controls using drag and drop or programmatically. You can also use databinding to retrieve and display data from Ektron.

Ektron provides a complete set of eCommerce server controls that let you set up an online marketplace where customers can purchase merchandise, services or content.

The following list shows typical actions a customer might perform when visiting your eCommerce site and how you can facilitate these actions.

- Viewing account information. Create a link in the master page that leads to the template containing the *MyAccount* on page 2384 server control. This link should be available from any page.
- Viewing previous and current orders. Create a link in the master page that leads to the template containing the *OrderList* on page 2390 server control. This link should be available from any page.
- Changing the currency type. Add the *CurrencySelect* on page 2381 server control to a master page. This server control should be available from any page.
- Searching for products. Either create a link to the template containing the *ProductSearch* on page 2085 server controls. Or, on the master page, add a text box that passes the text to a hidden ProductSearch server controls and post the results to a separate template. This link or text box should be available from any page.
- Viewing a list of products. Create a template that contains the *ProductList* on page 2405 server control. This template might be the first page customers see when they view the eCommerce portion of your site. Whenever you want to display a list of products based on a catalog, taxonomy or a list content IDs. For example, you could create a list of products in a panel on the right side of your website.
- Viewing a product's details. Create a template that contains the *Product* on page 2396 server control. Use this whenever a customer needs to view details of a product. Set any of the following server control's TemplateProduct property to the path of this control. This makes a product's title being displayed by one of these controls a clickable link that takes the customer to this control.
  - ProductSearch
  - ProductList
  - OrderList
  - Cart
  - Recommendation
- Viewing additional products associated with another product. Add the *Recommendation* on page 2413 server control to a template that contains a Product server control and set the Recommendation control's DynamicProductParameter property to the QueryString parameter that's used

to pass a products ID. When ever you want to present a customer with cross-sell and upsell opportunities associated with a given product.

- Adding a product to their shopping cart. Set the TemplateCart property in the following server controls to the path of the *Cart* on the facing page server control. Setting this property is one of the requirements for the Add to Cart button or link to appear in these controls.
  - ProductSearch
  - ProductList
  - Product
  - Recommendation

  NOTE: In addition to setting the above property, a product must be in-stock, not archived and buyable. Otherwise, the Add to Cart button or link does not show for a product.

  - Use this when you want to let customers add products to their shopping cart.
  - Viewing products in their shopping cart. When a customer adds a product to their cart, they are sent to the Cart server control. You should also create a link in the master page that leads to a template containing this control. The link should be available from any page.
- Checking out and paying for their selected product. Add the *Checkout* on page 2367 server control to a template and add that template's path to the Cart server control's TemplateCheckout property. When you do, the Checkout button in the Cart server control becomes active. You must set this up for customers to checkout.

Customizing eCommerce server controls with event hooks

The eCommerce server controls contain event hooks so you can customize or manipulate them. To use these event hooks, create a handler for each needed event in the code-behind of the ASPX page that contains an eCommerce server control. Then, in that page's `OnInit` method, hook each event.

- **PhaseChange**. Used only in the Checkout server control and called when the current phase is about to change. Supervise phase changes and allow or prevent changing as needed. It also lets you jump to a specified phase. For example, you could jump to a passed phase, prevent the phase from changing from the current one under certain conditions, or jump to a phase that is not necessarily the next one in line.
- **PreProcessXml**. Called immediately before the control's XML is transformed. Inspect or manipulate the server control's XML before being processed. This is the only time the XmlDoc property should be used to access the controls XML.
- **PostProcessXml**. Called immediately after the control's XML is transformed. Work with processed transformed XML output inside the Text property before

sending it to the browser. This allows simple string manipulation of the server control's markup.

- **FilterAjaxCallback**. Called when an Ajax-Callback event occurs. Inspect or modify callback parameters. For example, you could use this event to receive custom values entered in a page.
- **PostLogin**. Used only in the Checkout server control and called immediately after a (possibly new) user logs in with this control. Calls custom code immediately after a returning user logs in with an email and password. Or, immediately after a new customer fills out the billing info screen. For example, you could add code that lets new customers sign up for Web Alerts after they add their information to the billing screen.

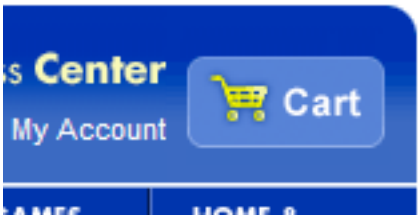
Cart

8.50 and higher

The Cart server control lets a customer (site visitor) select products to purchase; an online "shopping basket." Products are added to the cart when the customer selects them.

A customer typically reaches the Cart server control from a product description or list page. A product description page contains a *Product* on page 2396 server control. Product list pages contain server controls that create a list of products, such as *ProductList* on page 2405, *ProductSearch* on page 2085 or *Recommendation* on page 2413 server controls. These controls contain a button or link that allows a customer to add the product to the cart.

You could also create a link to the cart from a master page or menu that lets customers view their cart. This link lets a customer navigate directly to the cart when they arrive at your site.



Inserting the Cart server control onto a page

PREREQUISITE

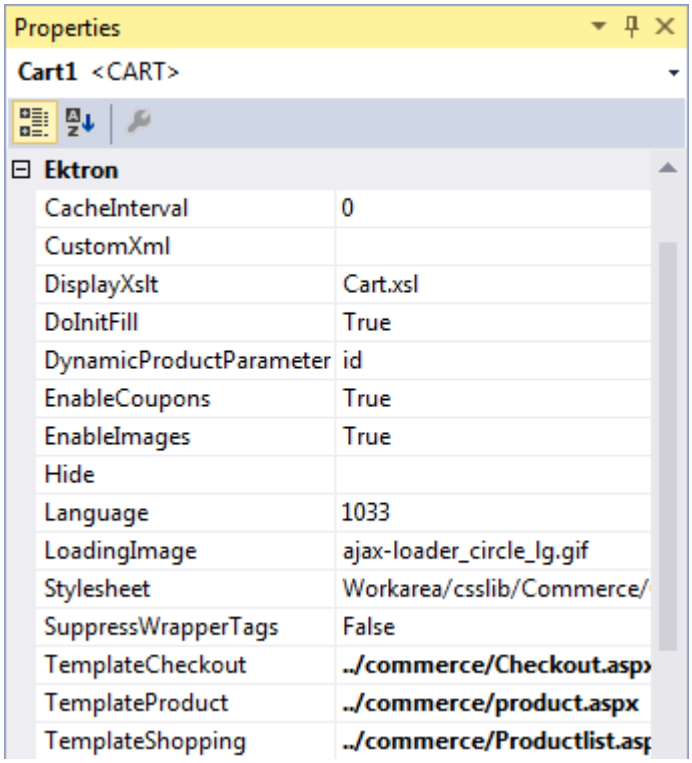
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Cart** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Cart ID="Cart1" runat="server" />
```

4. Click on `Cart` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Cart properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DisplayXslt** (String). If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses *siteroot*\Workarea\Xslt\Commerce\Cart.xsl.

  WARNING! Files stored in the siteroot\Workarea folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the siteroot\workarea folder then edit it. If there is no default file, create the file outside the siteroot\workarea folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean). Controls when Fill occurs.

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicProductParameter** (String). The QueryString parameter name which is used to pass the product ID to the product details page. For example, if your QueryString parameter for products is ID, enter that in this property. Then, when a customer clicks a product's title, this parameter is passed with the product's ID to the product details page.
- **EnableCoupons** (Boolean). Set to true to allow a customer to enter coupon codes for discounts. When set to false, the **Apply Coupon** button is hidden. Default value is True if this property is not set. See also: Using Coupons.
- **Hide** (Boolean). Used to hide the control in design time and run time.
  - **True**. Hide the control
  - **False**. Show the control
- **Language** (Integer).

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LoadingImage** (String). The image to display while the cart is loading. The default image is *siteroot*\Workarea\images\application\ajaxloader_circle_lg.gif.

  WARNING! Files stored in the siteroot\Workarea folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the siteroot\workarea folder then edit it. If there is no default file, create the file outside the siteroot\workarea folder. Next, in this property, enter the path to that file relative to the site root folder.

- **Stylesheet** (String). Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the siteroot\workarea folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder. The default style sheet is ***siteroot*\Workarea\csslib\Commerce**cart.css.
- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateCheckout** (String). The template that contains the Checkout server control. A customer is directed to this page when he clicks **Checkout**. If the template file is located in the same folder as the Web form containing this server control, just enter its name. The path can be relative or absolute. See also: *Checking out* on page 2367.
- **TemplateProduct** (String). The template that contains the Product server control. A customer is directed to this page when a product in the cart is clicked. This page provides details about the product. See also: *Displaying a product* on page 2400.

  If this property is blank, the server control uses the Product's QuickLink information.

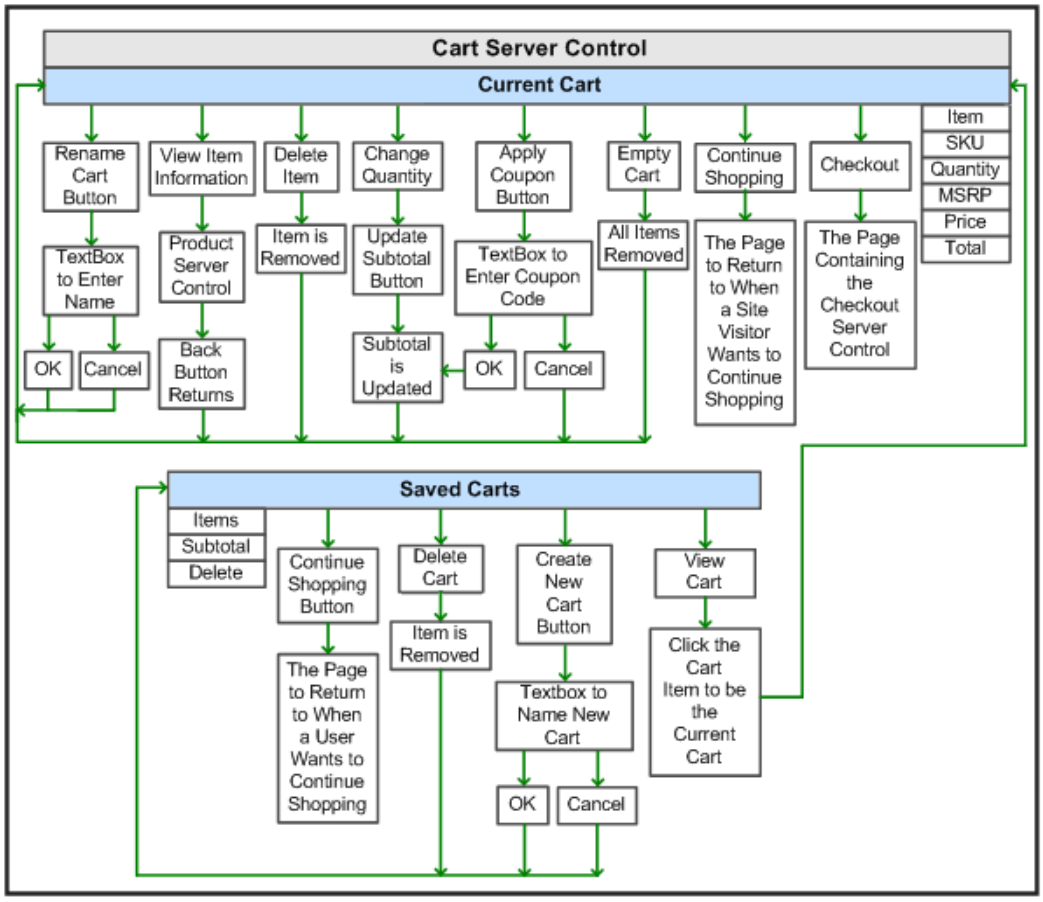
  If the template file is located in the same folder as the Web form containing this server control, just enter its name. The path can be relative or absolute.

- **TemplateShopping** (String). The URL to navigate to when the customer clicks **Continue Shopping**. This URL could direct the customer to a template containing a ProductSearch or ProductList server control, which lets the person select additional products. See also: *Continuing to shop* on page 2366.

Items are added to a cart when a customer clicks **Add to Cart** in the following server controls.

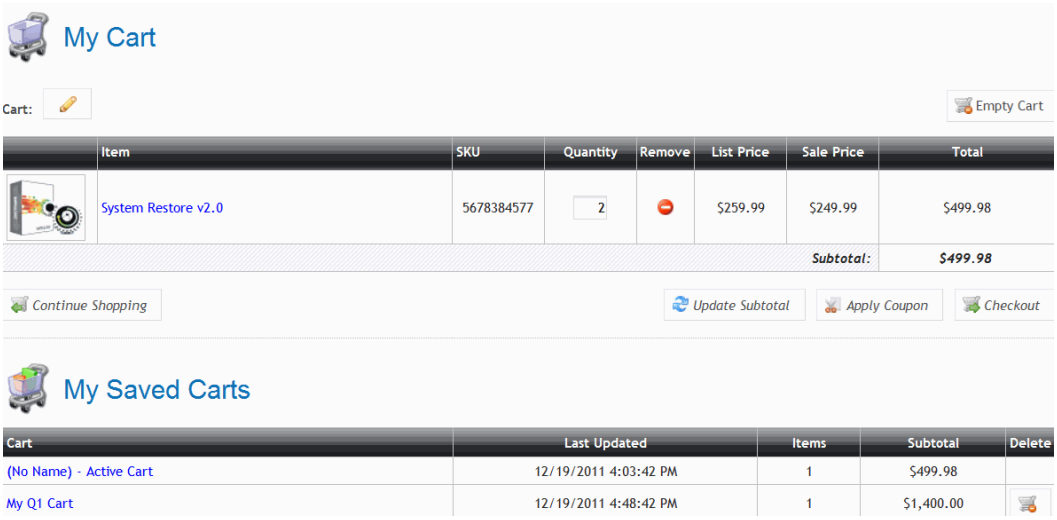
- *Product* on page 2396
- *ProductList* on page 2405
- *ProductSearch* on page 2085 templated server controls
- *Recommendation* on page 2413

When **Add to Cart** is clicked, the item is appended to the current cart's list of items. If the customer does not have a cart, one is created. The following image depicts the flow of the Cart server control.



Cart server control areas

The Cart server control consists of 2 major areas. The top part (**My Cart**) represents the cart with which the customer is currently working. The bottom (**My Saved Carts**) represents a visitor's saved carts. Saved cart information appears only when a customer is logged in. See also: *Creating a cart* on page 2365.



The **My Cart** area displays the Item, SKU, Quantity, List Price, Sale Price, Subtotal and Total. From this cart, a customer can remove items, update the quantity and subtotal information, apply coupons and check out. The customer can also choose to continue shopping or empty the cart.

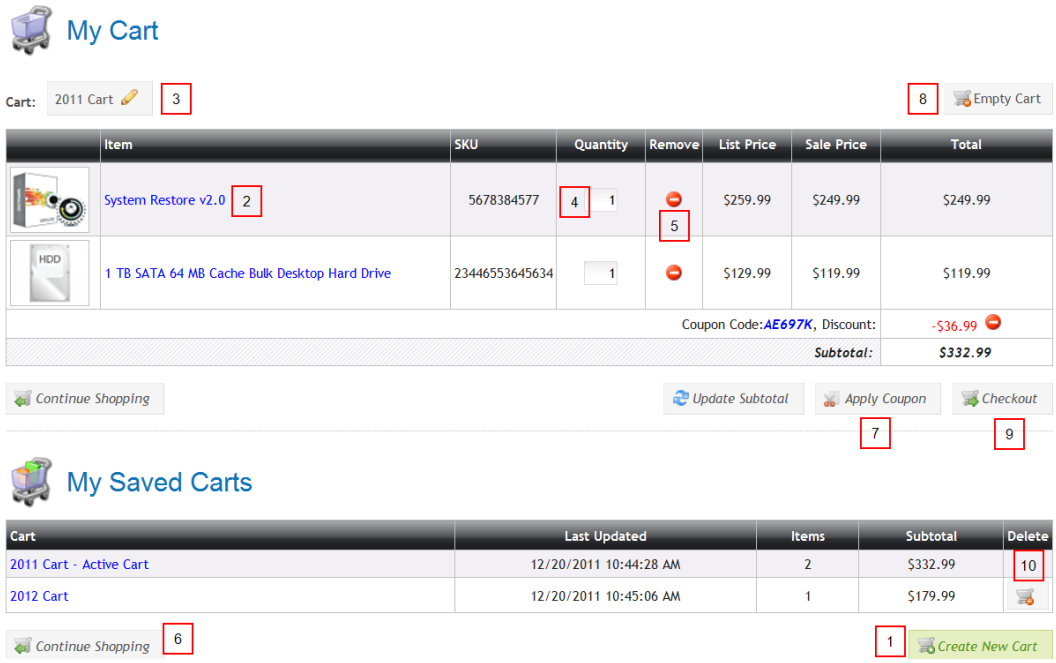
The **My Saved Cart** area contains a list of carts the customer has saved and are awaiting checkout. This allows the customer to select products and save them for future purchase. This area contains:

- the name of each cart
- the last time it was updated
- how many items in each cart
- the subtotal of each cart
- options to
  - delete a saved cart
  - create a new cart
  - continue shopping

Clicking a saved cart makes it the current cart, and displays its products in the **Your Cart** area. A customer can then proceed to check out.

Working with a Cart

This section explains how a logged-in customer would use the Cart server control. The following figure helps you locate key features of the Cart.



1. Create New Cart button.
2. Item name link.
3. Cart name edit button.
4. Item quantity field.
5. Delete item button.
6. Continue Shopping button.
7. Apply coupon button.
8. Empty Cart button.
9. Checkout button.
10. Delete Cart button.

Creating a cart

A customer automatically creates a new cart the first time a product is added to it. If needed, a customer can create multiple carts while using the Cart server control. This allows for the grouping of products being purchased. For example:

- customers create carts based on concepts, such as, Son's Birthday or Item Type.
- customers use separate payment types. For example, a customer places some products on one credit card and the rest on another. By having 2 carts, a customer can proceed with 2 separate checkouts.
- customer needs to prioritize purchases. For example, a customer wants to purchase certain products, but cannot afford them right now. The customer can add these products to a separate cart, then continue to purchase affordable products now. This helps customers remember purchases they want to make, driving additional sales for your site.

To create a new cart:

1. Click **Create New Cart** in the **Saved Cart** area. (See Callout 1.) The button is replaced with a text box.
2. Enter the name of the new cart in the text box.
3. Click **OK**.

When the customer clicks **OK**, the cart is added to the list of Saved Carts and becomes the active cart. A customer can then click **Continue Shopping** to select products to add to the new cart.

Displaying an item's information

In the Cart server control, a product's title is a link. When clicked, it takes you to the product's detail page. (See Callout 2.) To navigate back to the cart, click your browser's Back button.

By default, the server control uses the product's QuickLink information to provide a path to the product. You can override this functionality by adding a new path to the TemplateProduct property.

Assigning or changing the name of the cart

Assigning a name to a cart makes it easier for customers to identify a cart in their saved cart list. A customer can assign or change the name of a cart by clicking **Edit** () next to the cart's name. (See Callout 3.)

When clicked, the button and name are replaced with a text box that allows the customer to enter a new name for the cart.

Changing an item's quantity

To change a product's quantity, enter the new amount in the **Quantity** column's textbox, located in the same row as the product you want to change. (See Callout 4.) Next, click **Update Subtotal**. This recalculates the price of the product and updates the subtotal. The image below shows the Atrium Table quantity change to 3.

Removing an item from the cart

A customer can remove a product from the cart by clicking **Remove From Cart** () in the **Quantity** column. (See Callout 5.) When the customer clicks the button, the product is removed from the cart, and the subtotal is updated.

Continuing to shop

A customer can continue to shop by clicking **Continue Shopping**. (See Callout 6.) This redirects the visitor to a template defined in the cart server control's `TemplateShopping` property. For example, you might send the customer to a page containing a *ProductList* on page 2405 server control or *ProductSearch* on page 2085 templated server controls.

As a developer, you need to add the path to this page to the `TemplateShopping` property. If the page is in the same folder as the page that contains the Cart server control, just enter the page's name.

Applying coupons

If coupons are defined in the Workarea and the `EnableCoupons` property is set to True, a customer can enter coupons to discount the purchase. How coupons affect the purchase is defined in the **Workarea > Settings > Commerce > Catalog > Coupons**. See also: Using Coupons.

To apply a coupon, a customer clicks **Apply Coupon**. (See Callout 7.)

The button area changes to text box where the customer can enter the **Coupon Code**. The customer then enters a code and clicks **OK**. Next, the discount appears above the **Subtotal**, and the customer can continue to shop, check out, view other carts, or delete the coupon by clicking **Remove Coupon**.

Emptying the current cart

To remove all products from the current cart, a customer clicks **Empty Cart**. (See Callout 8.) When clicked, a dialog box appears and the customer can click **OK** or **Cancel**.

Checking out

When a customer is satisfied that the cart contains all products they want, the quantity of each product is correct and all coupons have been applied, the customer can click **Checkout**. (See Callout 9.) At that point, the customer is redirected to the page that hosts the Checkout server control. The path to the page is defined in the `TemplateCheckout` property. If the page containing the Checkout server control is in the same folder as the Cart server control, just enter the page name.

If a cart includes an item that is out of stock, the **Checkout** button is disabled (hidden).

Deleting a saved cart

A customer can delete a saved cart by clicking **Delete Cart**. (See Callout 10.)

Checkout

8.50 and higher

Customers typically arrive at this server control by clicking **Checkout** on the Cart server control. They also might reach this server control from a Checkout link you create on your site. The Checkout server control lets a customer navigate through the checkout process. This process includes:

- adding billing and shipping information
- selecting a shipping method
- reviewing the order
- submitting the order and credit card information
- notification that checkout process is complete

IMPORTANT: When using the Checkout server control, your website should have an SSL certificate installed. Set its `IsSSLRequired` property to **True**. This protects your

customers' payment information during transmission. Do not use a self-signed SSL certificate; obtain one from a trusted certificate authority.

The control provides a navigational aid that indicates the customer's step in the checkout process. At any point, the customer can move forward to the next step or back to a previous one. When appropriate, some steps do not appear. For example, if merchandise is not tangible, the shipping screen does not appear.

Inserting the Checkout server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

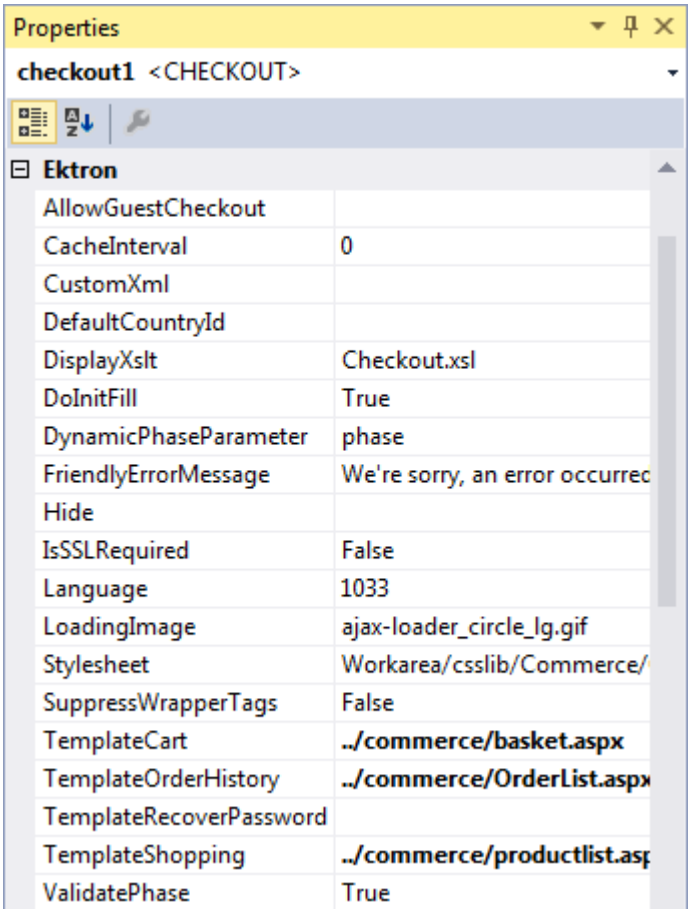
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Checkout** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Checkout ID="Checkout1" runat="server" />
   ```

4. Click on `Checkout` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



Checkout properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AllowGuestCheckout** (Boolean)
  Set to true if you wish to allow the Guest Checkout feature.
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **CurrentPhase** (Code-behind Only) (ControlPhase)
  Reports or selects the current page (or phase) of the checkout control. This lets you customize the flow of the control. For example, if you only offer one shipping option, skip the ShippingInfoEntry phase.
  - **Login**. Allows existing users to log in. *Logging in or setting up an account* on page 2373.
  - **BillingInfo**. Displays a customer's billing information. See also: Billing Information.

- **BillingInfoEntry**. Allows entry of a customer's billing information. See also: Billing Information.
- **ShippingInfo**. Allows entry of a customer's shipping information.
- **ShippingInfoEntry**. Allows entry of a customer's shipping information. See also: *Shipping information* on page 2377.
- **ShippingMethodSelect**. Allows selection of the shipping method. See also: *Shipping method* on page 2378.
- **ReviewOrder**. Displays the current order's details. See also: *Review order* on page 2378.
- **SubmitOrder**. Lets customers add payment information. See also: *Submit order* on page 2379.
- **Complete**. Displays completion message. See also: *Order complete* on page 2380.
- **Error_EmptyBasket**. Used when a cart has no items and the customer somehow enters the control.
- **Error_UnhandledException**. Occurs when there's an error that the control cannot resolve.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DefaultCountryId** (Integer)

  The ID of the default country that appears in the Billing Address and Shipping Address. Set this to the country from which the majority of your customers make purchases. If a customer is from a different country, he can change it when editing the Billing or Shipping Address.

  To find a country's numeric ID, go to **Workarea > Settings > Commerce > Configuration > Countries**. The Numeric ID is in the left column of that screen.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `Checkout.xsl`. This file is located in *`siteroot`*`\Workarea\Xslt\Commerce\Checkout\Standard`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicPhaseParameter** (String)

  The name of the parameter on the QueryString that identifies desired phase ID.

- **FriendlyErrorMessage** (String)

  The message displayed when an unhandled error occurs. Details are sent to the event log.

  The default message is "*We're sorry, an error occurred while processing your request. Please try again later...*"

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IsSSLRequired** (Boolean)

  When set to True, switches to an SSL encrypted URL. For the SSL encryption to work, you must have an SSL certificate installed for your site. See also: Updating web.config to use SSL. Information on SSL can be found at the following websites.

  - Secure Sockets Layer (SSL) (Tech-FAQ)
  - Introduction to SSL (Symantec)

  NOTE: Episerver is not associated with TechFAQ or VeriSign. However, both sites offer good explanations of Secure Sockets Layer.

  Installing and using an SSL is one of the most important things you can do to protect your customer's credit card data.

- **Language** (Integer)

  Set a language for viewing the checkout control. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LoadingImage** (String)

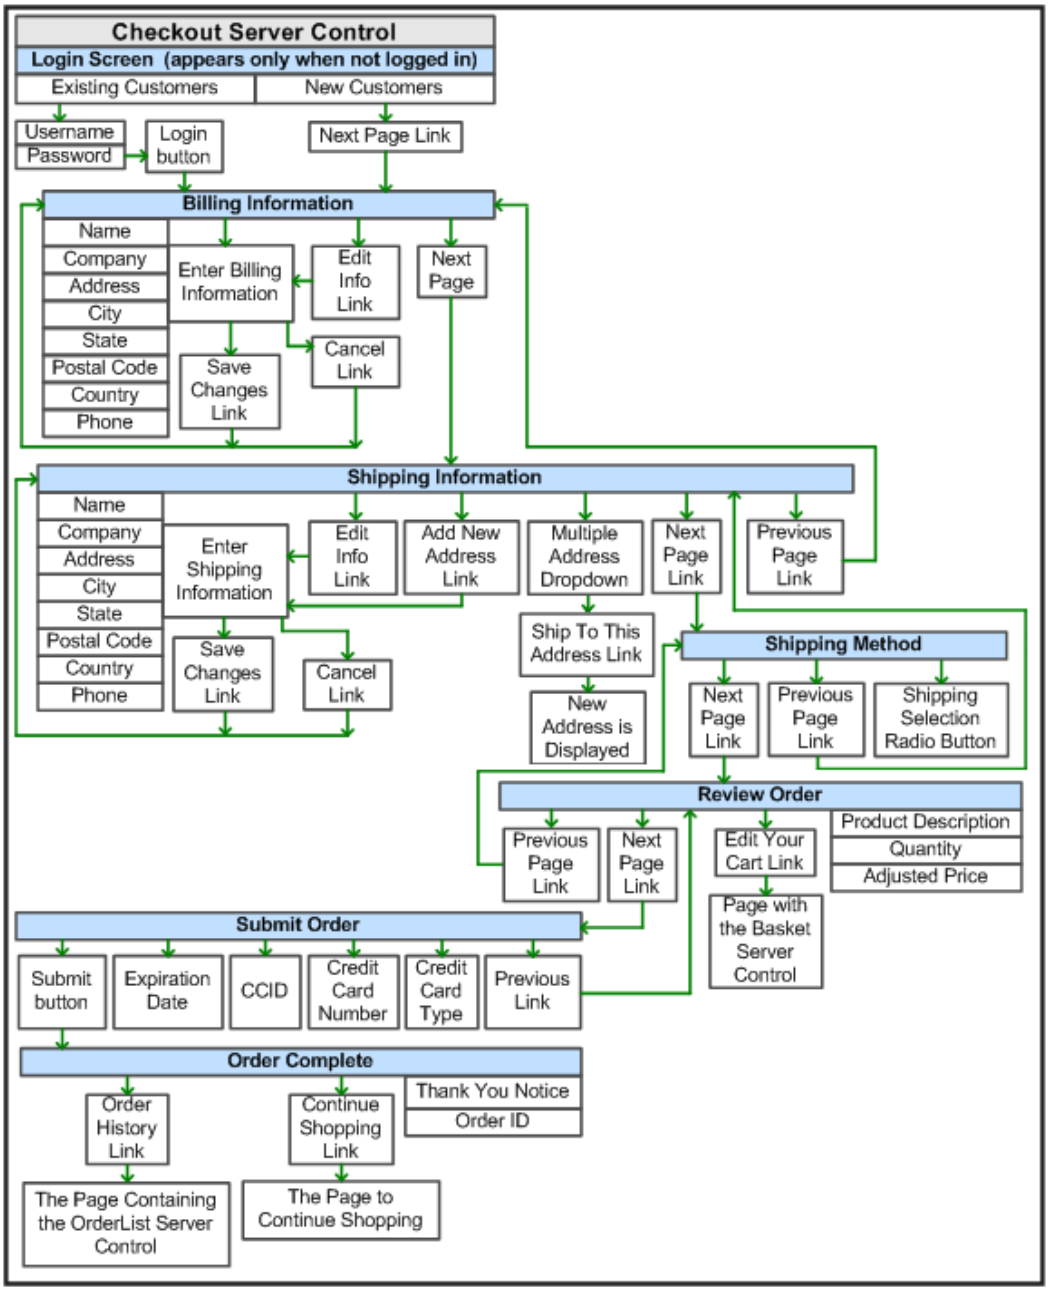
  The image to display while the control fetches data. The default is `siteroot\Workarea\images\application\ajax-loader_circle_lg.gif`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.
- **SuppressWrapperTag** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateCart** (String)
  The URL path of the template that contains the *Cart* on page 2359 server control. The path can be relative or absolute.

  When a path is entered, a link appears in the Review Order part of the process that allows a user to navigate to the template containing the Cart server control.
- **TemplateOrderHistory** (String)
  The URL path of the template that contains the *OrderList* on page 2390 server control. The path can be relative or absolute. When a path is entered, a link appears at the end of checkout process that allows a user to navigate to the template containing the OrderList server control.
- **TemplateRecoverPassword** (String)
  The URL path of the template that helps a customer recover a password. The path can be relative or absolute. When a path is entered and a customer has not logged in, a link appears at the beginning of checkout process that lets the customer navigate to a template containing information to recover the password. The Membership server control contains an option for recovering passwords. See also: Logging In or Setting Up an Account and *Membership* on page 2482 server control.
- **TemplateShopping** (String)
  The URL path of the template that allows the customer to continue shopping. If a path is entered, a link appears at the end of checkout that allows a user to navigate to a template that lets the person continue shopping; for example, the template containing a *ProductList* on page 2405 server control or *ProductSearch* on page 2085 server controls.

The following chart represents the options and processes of the Checkout server control.



Logging in or setting up an account

The login portion of the Checkout server control accommodates these types of customers.

- **Existing customers**

  If an existing customer is not logged in when the customer reaches this server control, it prompts the customer to log in. Optionally, this screen could have a link that lets an existing user to recover a password. To enable this link, add a template path to the control's `TemplateRecoverPassword` property.

  After a customer who previously purchased from this site logs in, billing and shipping information is retrieved and appear by default. The visitor can review

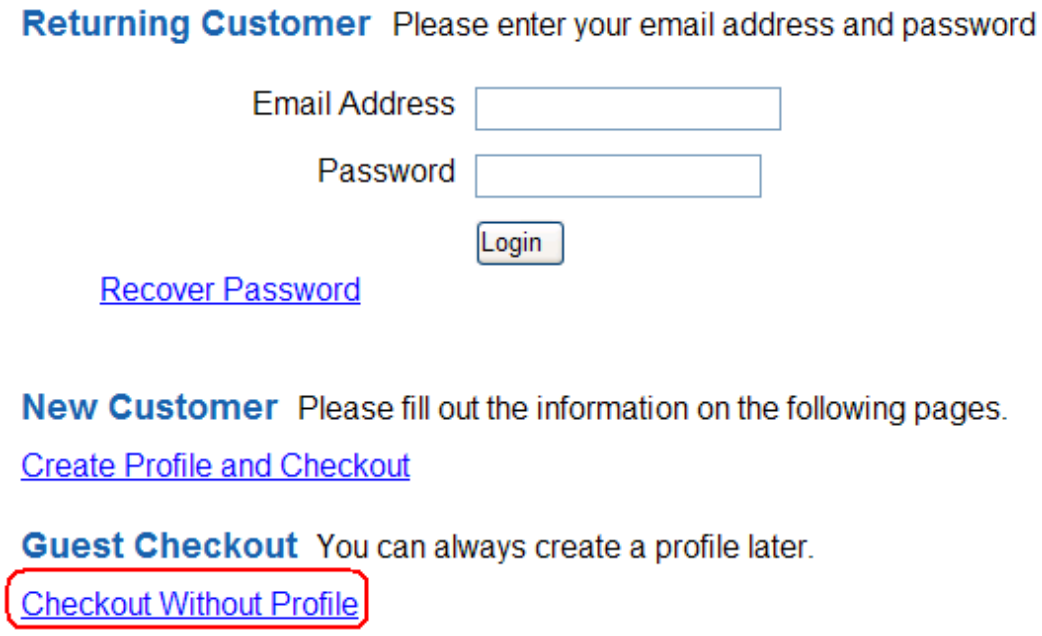
and edit this information. However, Ektron does not store credit card numbers, so that information must be entered each time.

- **First-Time Customer**. Customers who have not logged in before but who wish to create an account

  If a customer has not purchased from your site before and wants to set up an account, the customer clicks **Create Profile and Checkout**. On the new screen, the customer enters billing information including a password. After completing that screen, a membership user account is created, and the customer is logged in. The new user can then proceed through the checkout. The next time this visitor logs in, the customer is treated as an existing customer.

- **Guest Account Registration. C**ustomers who wish to make one-time only purchase and not set up an account.

  The Checkout server control provides a guest checkout feature (circled below) for customers who do not want to set up an account on your site. To enable this feature, set the `AllowGuestcheckout` property of the Checkout server control to `true`.



If a user clicks **Checkout Without Profile**, the customer proceeds to a version of the billing screen that does not ask for a password. The rest of the checkout is the same.

Although the customer can proceed through the checkout like other customers, if the customer wants to checkout in the future, the customer must re-enter billing and shipping information. Customers who use the guest checkout feature can view their orders using the Order List server control if its `GuestOrderView` property is set to `true`.

Checkout screens

The Checkout server control has several sections, each representing a portion of the checkout process.

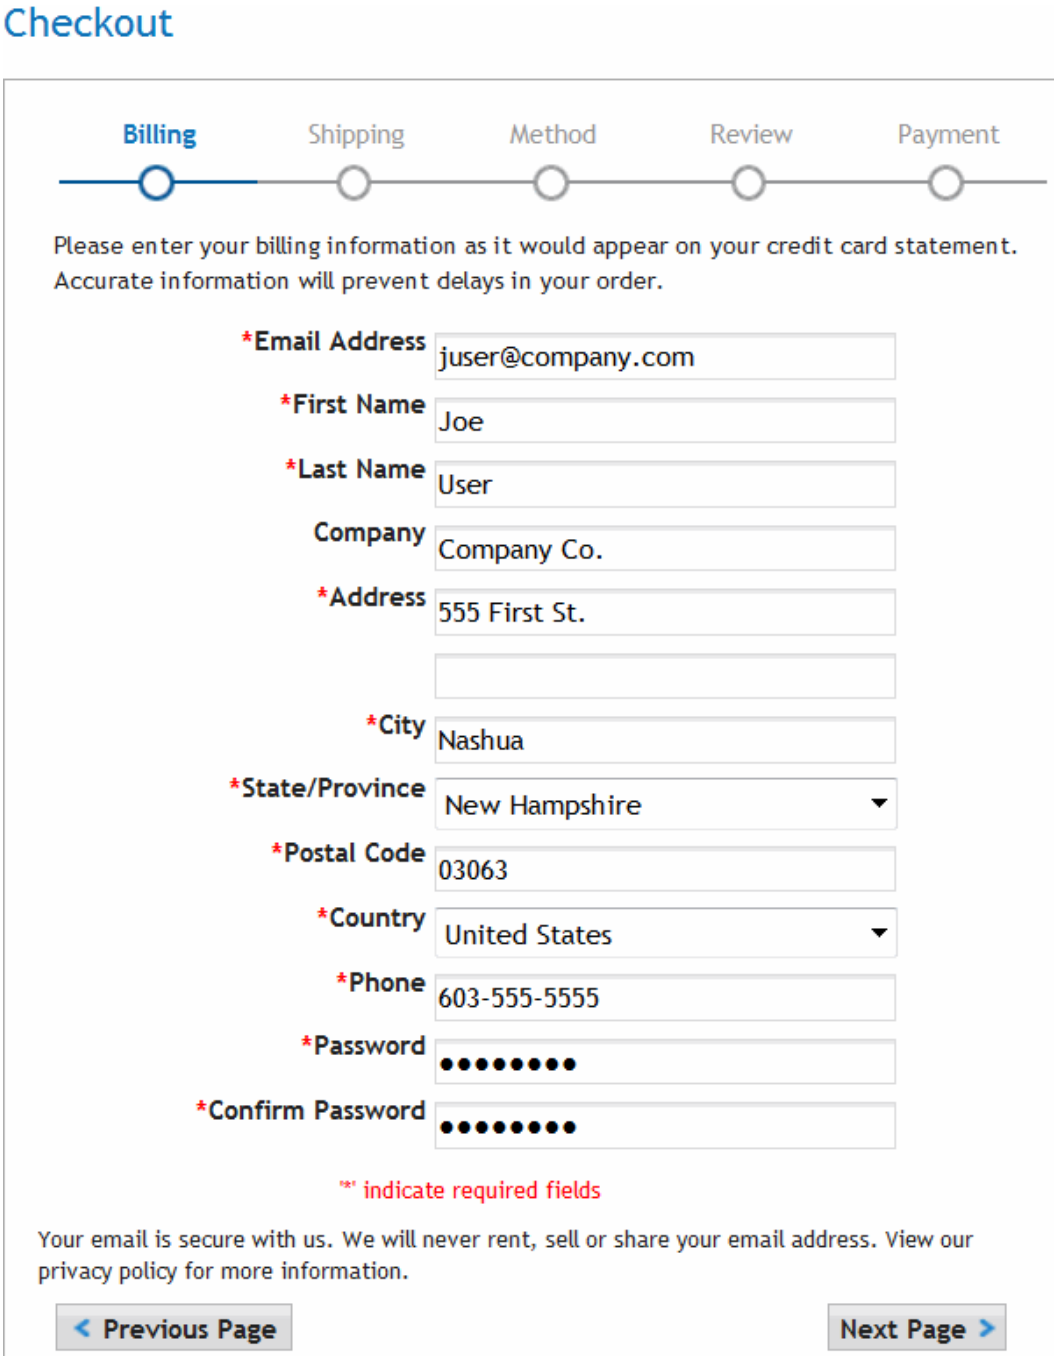
Billing information

Prompts customers to enter or update billing information, including:

- Name
- Company (Optional)
- Street Address, City, State, Postal Code, Country

  NOTE: If a customer chooses a country other than the United States, no field validation is applied to the postal code by default. To apply country-specific postal code validation, see *Applying field validation for non-U.S. postal codes* on the next page.

- Phone
- email address (appears when a visitor is creating a new account or doing a guest checkout)
- Password (appears when a visitor is creating a new account or doing a guest checkout)



Applying field validation for non-U.S. postal codes

1. Search the XSLTs for `EktronCheckout_PostalField`. The standard US Postal RegEx is applied to all input fields of this class.
2. Remove that class.

   WARNING! Be careful to remove only this class name; otherwise, the CSS styling may not be applied properly and the layout will be altered.

3. Add an attribute to each postal-code input field in the XSLTs with the following name: `data-ektron-validation-regex`. Then, add the desired RegEx as the value of this attribute. The RegEx expression will validate the user's input.

For the RegEx expression, you should be able to find one for the target country via a Web search. Alternatively, you can start here: http://www.regular-expressions.info/.

Canadian postal code solution

The following example shows how to apply field validation for Canada.

Attribute for U.S. postal code regex:

```
<xsl:attribute name="data-ektron-validation-regex">/^\d{5}(-\d{4})?$/
</xsl:attribute>
```

Attribute for Canadian postal code regex:

```
<xsl:attribute name="data-ektron-validation-regex">/^([ABCEGHJKLMNPRSTVXY]
  \d[ABCEGHJKLMNPRSTVWXYZ])\ {0,1}(\d[ABCEGHJKLMNPRSTVWXYZ]\d)$/
</xsl:attribute>
```

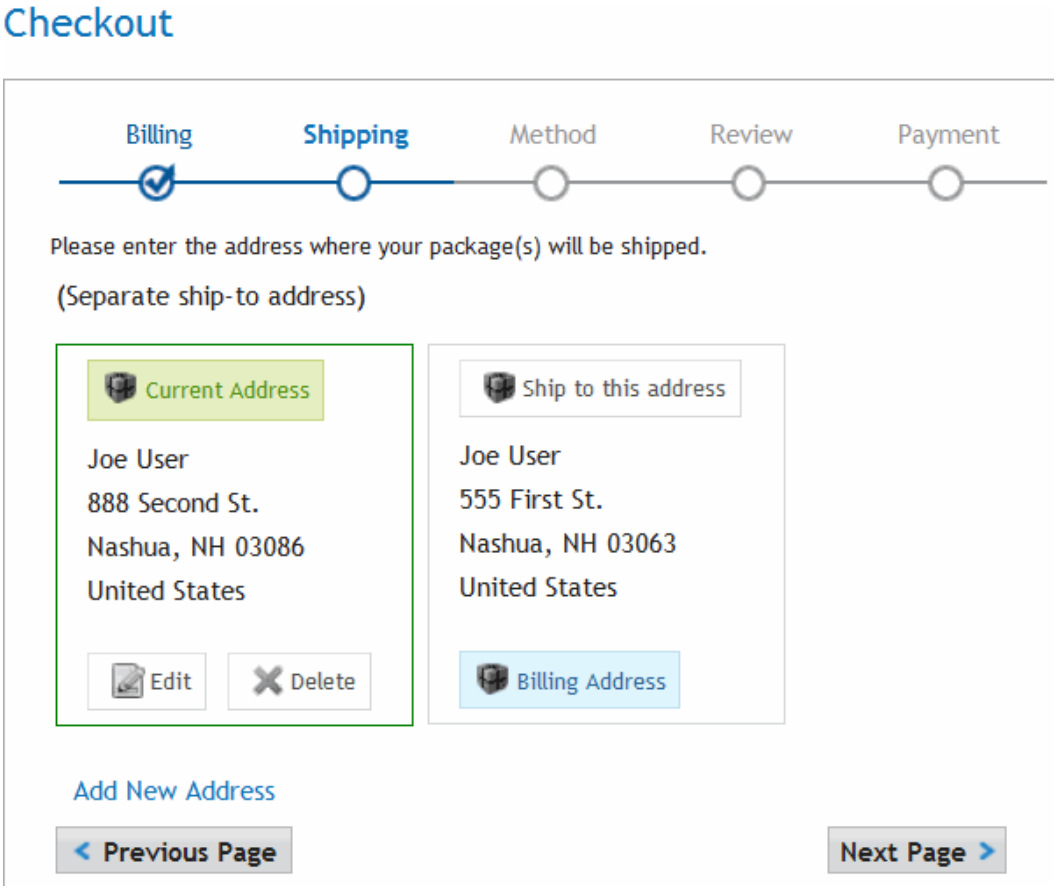
The following sample shows the entire postal code input block taken from billing info XSLT. Three checkout-related files that need these changes (`Checkout_BillingInfo.xsl`, `Checkout_BillingInfoEntry.xsl` and `Checkout_ShippingInfo.xsl`) are updated in the sample below for Canadian only postal codes.

```
<input class="EktronCheckout_PostalCode EktronCheckout_Row_RightContents" >
  <xsl:attribute name="name">EktronCheckout_BillingInfo_PostalCode_
    <xsl:value-of select="$ControlId"/></xsl:attribute>
  <xsl:attribute name="id">EktronCheckout_BillingInfo_PostalCode_
    <xsl:value-of select="$ControlId"/></xsl:attribute>
  <xsl:attribute name="value"><xsl:value-of select="/root/billingInfo/postalCode"/>
    </xsl:attribute>
  <xsl:attribute name="data-ektron-validation-regex">/^([ABCEGHJKLMNPRSTVXY]
    \d[ABCEGHJKLMNPRSTVWXYZ])\ {0,1}(\d[ABCEGHJKLMNPRSTVWXYZ]\d)$/</xsl:attribute>
</input>
```

Shipping information

Add or edit shipping information. By default, it uses the billing address as the shipping address. From this screen, customers can:

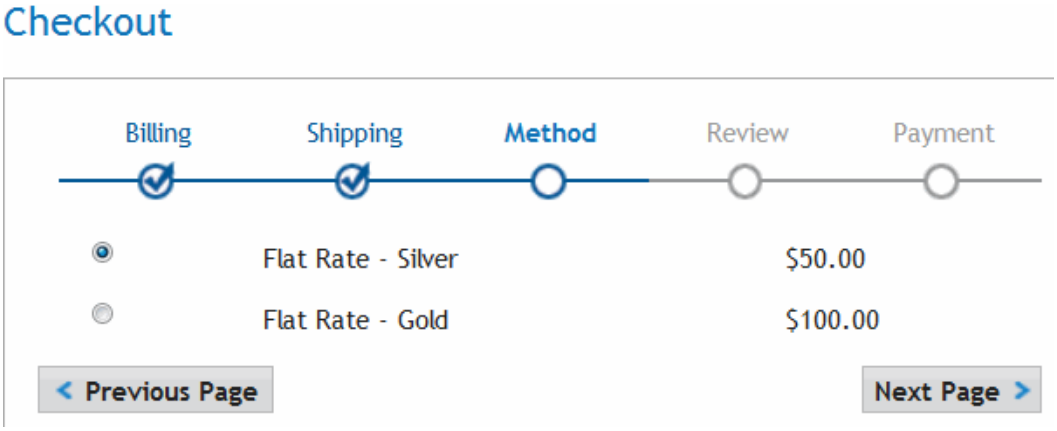
- add new addresses
- edit or delete existing addresses
- if more than one address is entered, pick address for current order
- proceed to the next step or back to the previous page



When a logged-in customer adds a new address, it is stored with the account information in Ektron.

Shipping method

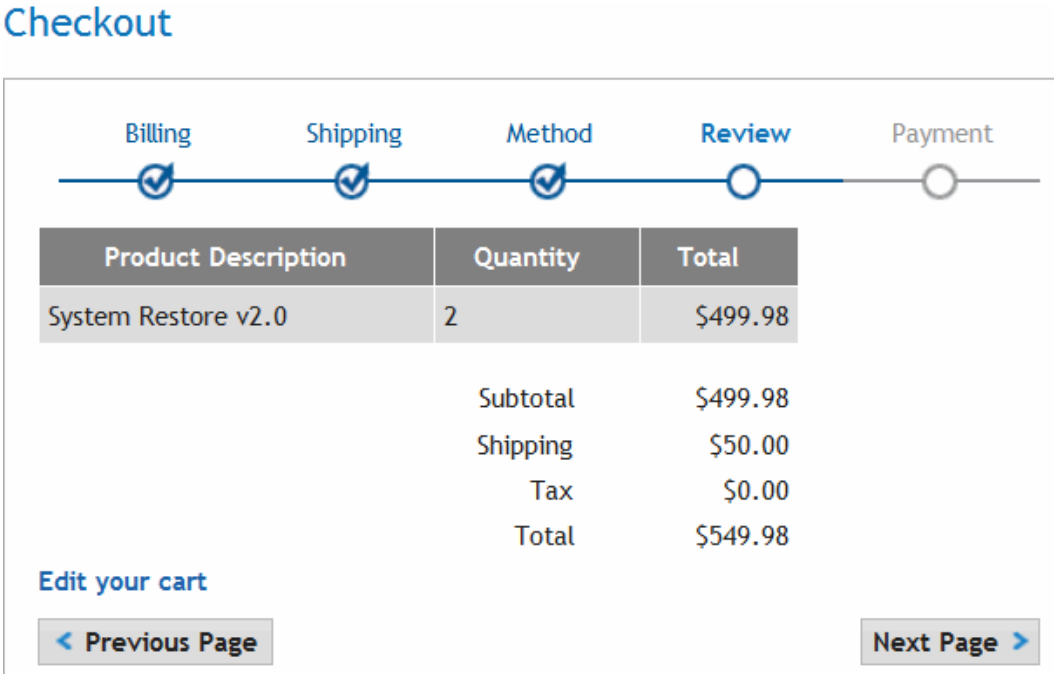
Select the type of shipping for products. Shipping methods that appear are defined in the **Workarea > Settings > Commerce > Shipping > Methods**. See also: Configuring Shipping Methods.



Review order

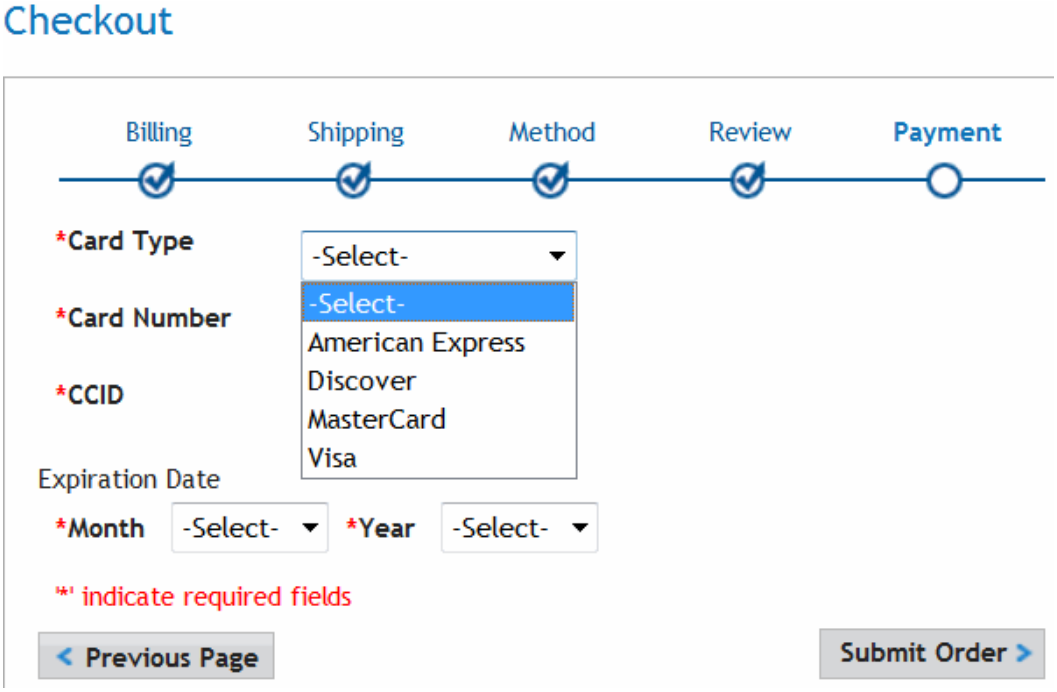
Displays information about products being purchased: their price, shipping charges, discounts, and taxes. At this point, if customers want to modify their cart, they click

Edit your cart. For example, a customer wants to apply a coupon to the cart. For this link to work properly, add the path to the template that contains the Cart server control to the Checkout server control's `TemplateCart` property.



Submit order

On the Submit Order page, a customer enters payment information. The customer can pay by check, credit card, or PayPal, depending on what has been set up in the eCommerce Payment Options screen. When a customer enters the information, the customer clicks **Submit**. At that point, the charge is submitted to the payment gateway, and the order is posted in Ektron. See also: Processing Orders.



Order complete

The Order Complete page displays a Thank You note, the order ID, and links to continue shopping or view an order's history.

The **Continue Shopping** link appears when you add the path of a template that allows a customer to find products to the `TemplateShopping` property. For example, you send them to a template containing a `ProductSearch` or `ProductList` server control.

The **Order History** link appears when you add the path of a template containing the OrderList server control to the `TemplateOrderHistory` property.

Adding a custom field to the checkout control

This example demonstrates how to add a custom field to the Checkout control's Billing Info entry screen.

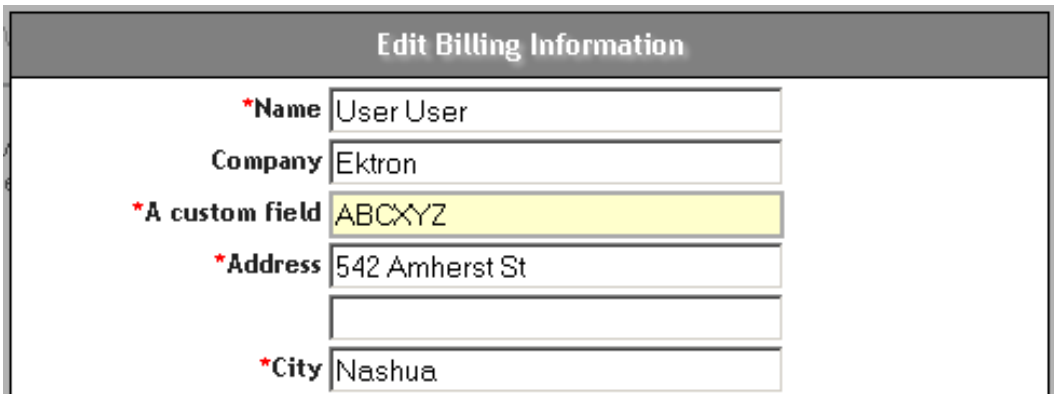
Step1: Add a field to the XSL

In the workarea/XSLT/Commerce/Checkout/ folder, look for the Checkout_ BillingInfo.xsl file. In the file, locate `EktronCheckout_BillingInfo_Company_`. Under the bulleted list item for company, add the following:

```
<li class="EktronCheckout_Required EktronCheckout_SerializableContainer">
      <label class="EktronCheckout_Row_LeftContents">
         <xsl:attribute name="for">
   EktronCheckout_BillingInfo_CustomField_<xsl:value-of select="$ControlId"/>
         </xsl:attribute>
        <span class="EktronCheckout_RequiredSymbol">*</span>
        A custom field
      </label>
      <input class="EktronCheckout_Company EktronCheckout_Row_RightContents">
         <xsl:attribute name="name">
   EktronCheckout_BillingInfo_CustomField_<xsl:value-of select="$ControlId"/>
         </xsl:attribute>
         <xsl:attribute name="id">
   EktronCheckout_BillingInfo_CustomField_<xsl:value-of select="$ControlId"/>
          </xsl:attribute>
         <xsl:attribute name="value">ABCXYZ</xsl:attribute>
      </input>
 </li>
```

Important notes:

- `EktronCheckout_Required`. Denotes that the field is required and will impose validation. `EktronCheckout_NotRequired` is also acceptable.
- `EktronCheckout_SerializableContainer`. Tells the checkout control to process and include the field in this <li> tag with the callback.
- `EktronCheckout_BillingInfo_CustomField_` . The name of the field, where `EktronCheckout_BillingInfo` is replaced with `param__` internally. The last portion, `CustomField`, is how the field will be referenced (see below).



Step2: Get the value of the field

In the codebehind of the page with the Checkout control, you need the following imports:

```
using Ektron.Cms.Controls;
using Ektron.Cms.Controls.ECommerce;
using Ektron.Cms.Controls.ECommerce.Checkout;
```

Next, place the following into the Page_Init method:

```
cmsCheckout.FilterAjaxCallback += this.HandleFilterAjaxCallback;
```

Then implement the HandleFilterAjaxCallback method:

```
protected void HandleFilterAjaxCallback(object sender,
FilterAjaxCallbackEventArgs e)
{
     string callbackParameters = e.EventArgs;
     System.Collections.Specialized.NameValueCollection data =
Ektron.Cms.Common.EkFunctions.ConvertToNameValueCollection(callbackParameters,
 true);
      string customFieldValue = data["param__customfield"];
}
```

Upon completing the Billing Info screen, the data is returned as part of the EventArgs, with the prefix `param__` (note the double underscore).

It can then be obtained directly by converting the string to a `NameValueCollection` (or other construct). Developers are free to call their own methods from here.

CurrencySelect

8.50 and higher

The CurrencySelect server control lets a customer select the monetary type he will use to make purchases. When a currency is selected, eCommerce server controls use it for that order. If the customer closes the browser, the currency needs to be selected again the next time the site is visited.

For a currency to appear in the CurrencySelect server control, enable it in the **Workarea > Settings > Commerce > Currencies** screen. See also: Configuring Currencies.

Inserting the CurrencySelect server control onto a page

PREREQUISITE

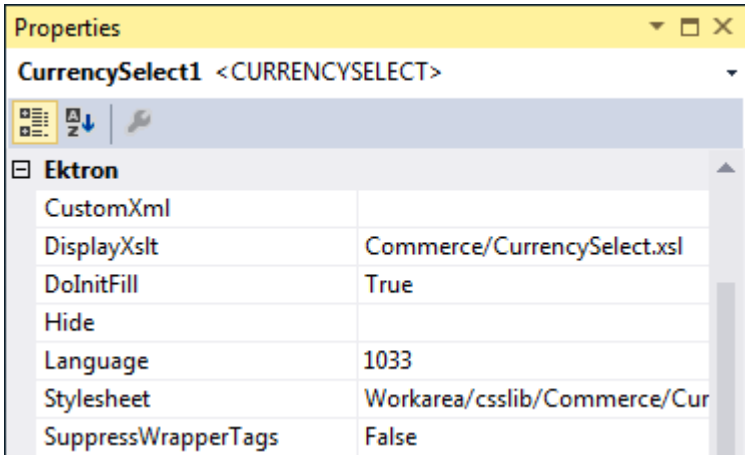
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **CurrencySelect** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:CurrencySelect ID="CurrencySelect1" runat="server" />
```

4. Click on `CurrencySelect` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



CurrencySelect properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses *siteroot*\Workarea\Xslt\Commerce\CurrencySelect.xsl.

  WARNING! Files stored in the siteroot\Workarea folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the siteroot\workarea folder then edit it. If there is no default file, create the file outside the siteroot\workarea folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the siteroot\workarea folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

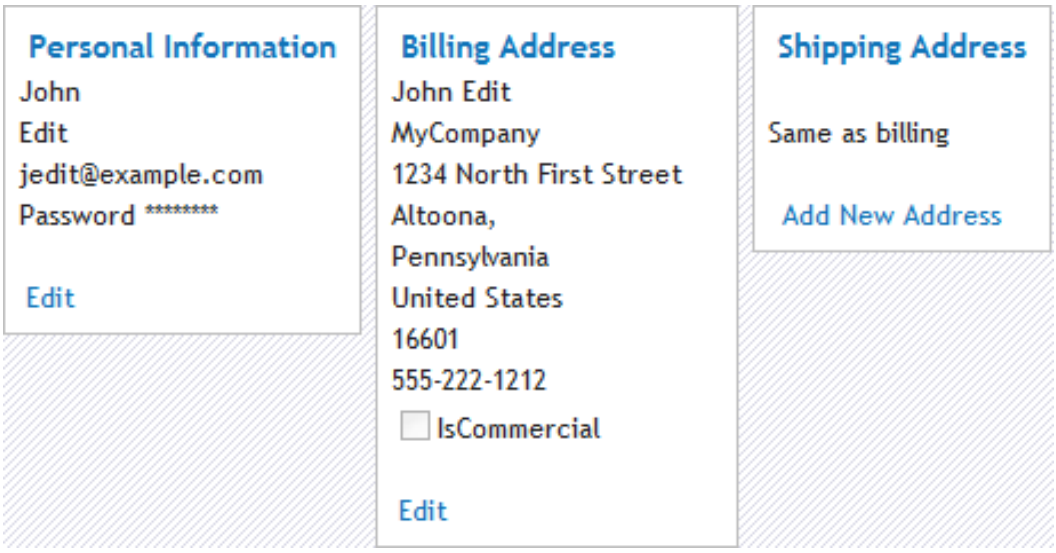
MyAccount

8.50 and higher

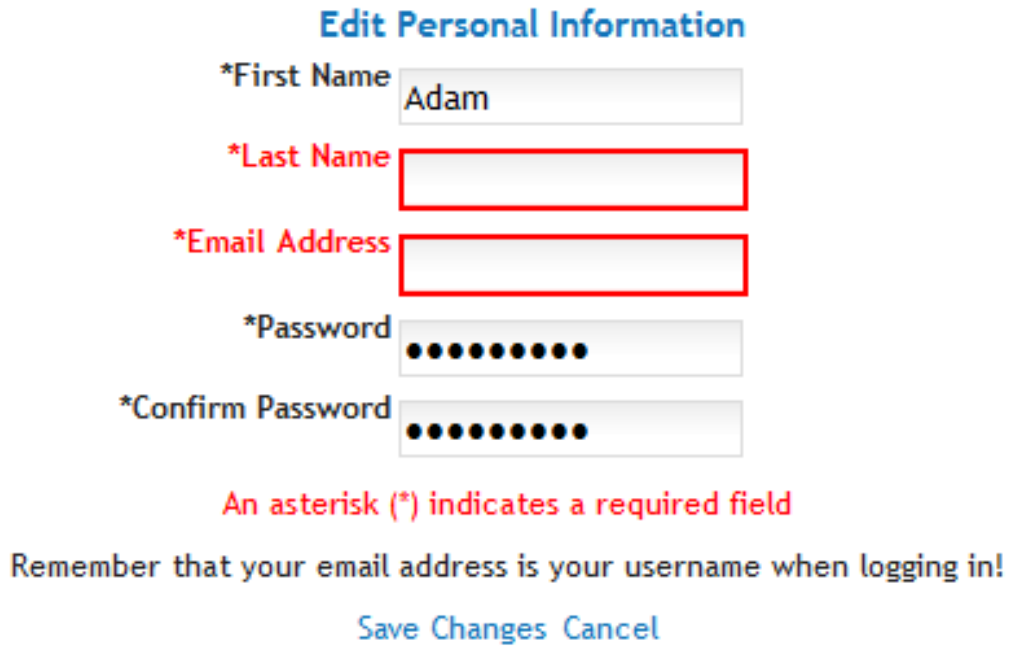
The MyAccount server control lets logged-in customers (site visitors) view and edit their Personal Information, Billing Address and Shipping Address. If the customer is not logged in and arrives at this control, one of the following happens:

- the visitor receives a message about not being logged in. This happens when the server control's `RedirectUrl` property is empty and the `web.config` file's `<add key="ek_RedirectToLoginURL" value="" />` value is blank.
- the visitor is redirected to a login page and once logged in, is sent back to the template containing the MyAccount server control. This happens when either the server control's `RedirectUrl` property contains the path of a template that contains a Login server control or when the `web.config` file's `<add key="ek_RedirectToLoginURL" value ="" />` `value` is set to the path of a template that contains a Login server control. If the control's `RedirectUrl` property and the `web.config` file contain different locations, the `RedirectUrl` property in the control overrides the `web.config` file.

Typically, the information displayed in this control is collected the first time a customer goes through the checkout process. A customer's information might appear in the Personal Information area before they have been through the checkout process if they are a current Ektron user or registered membership user.

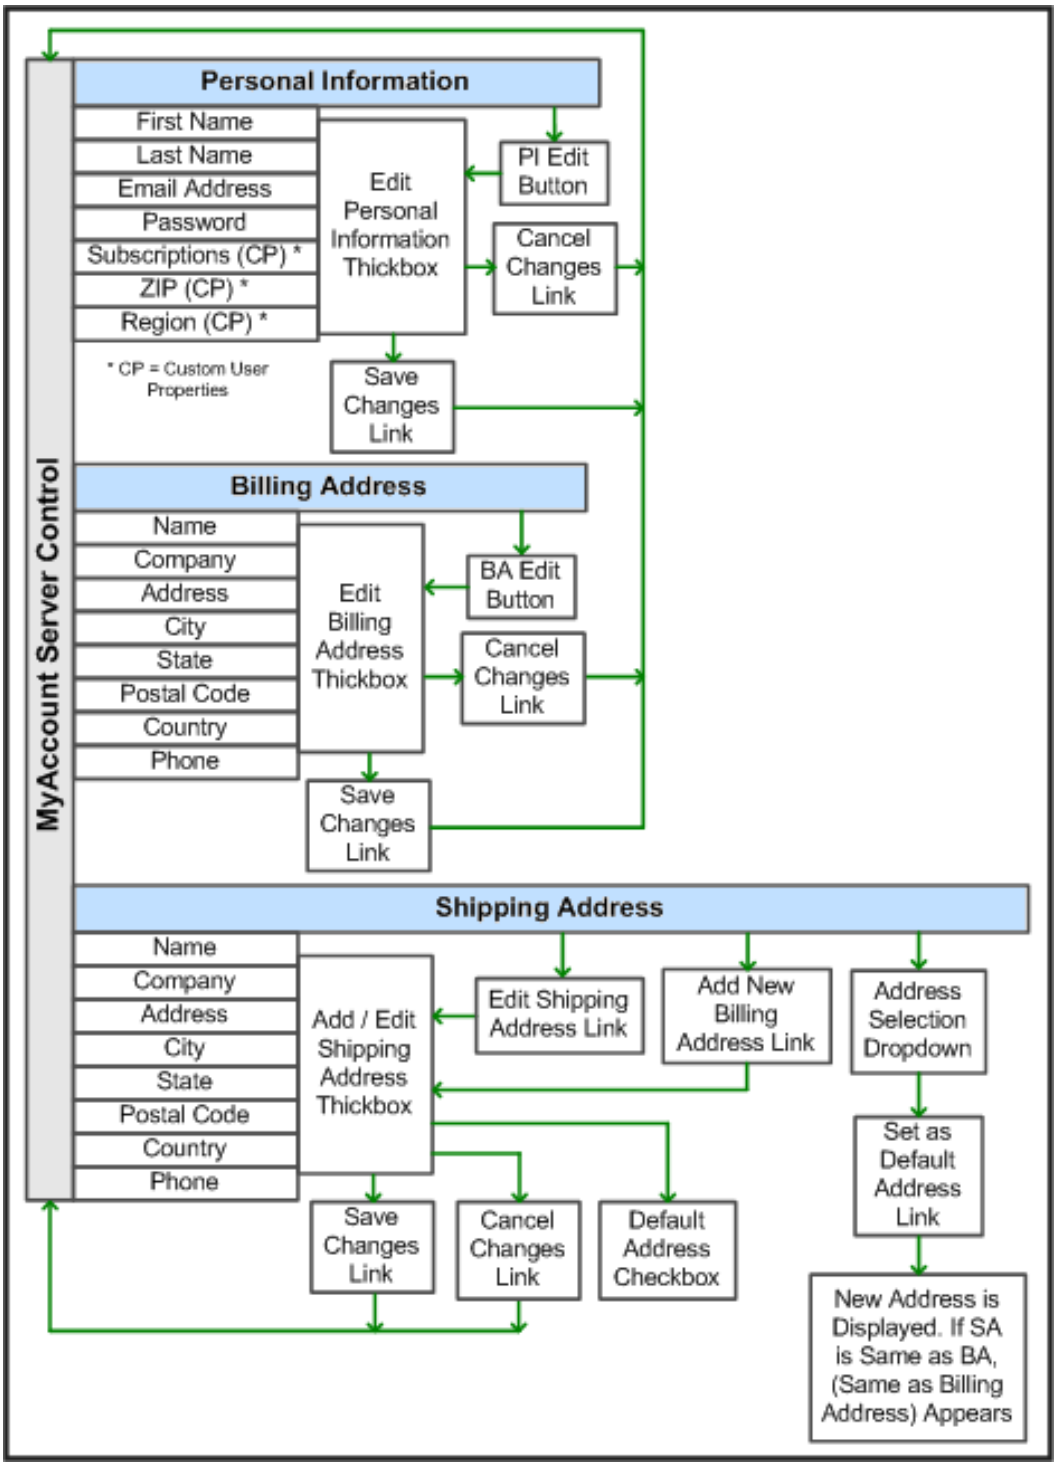


If a logged-in customer arrives at this server control and is missing required information, it must be entered before continuing. For example, a customer needs to provide a Last Name or E-mail Address.



As a developer, you need to create a link to this control in a site location that appears only after log in. For example, you might place the link on a menu or on a master page that appears after a customer logs in.

A customer typically arrives at this control by clicking a link placed on a main page, master page, or menu. The following figure shows the flow of the MyAccount server control.



Inserting the MyAccount server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

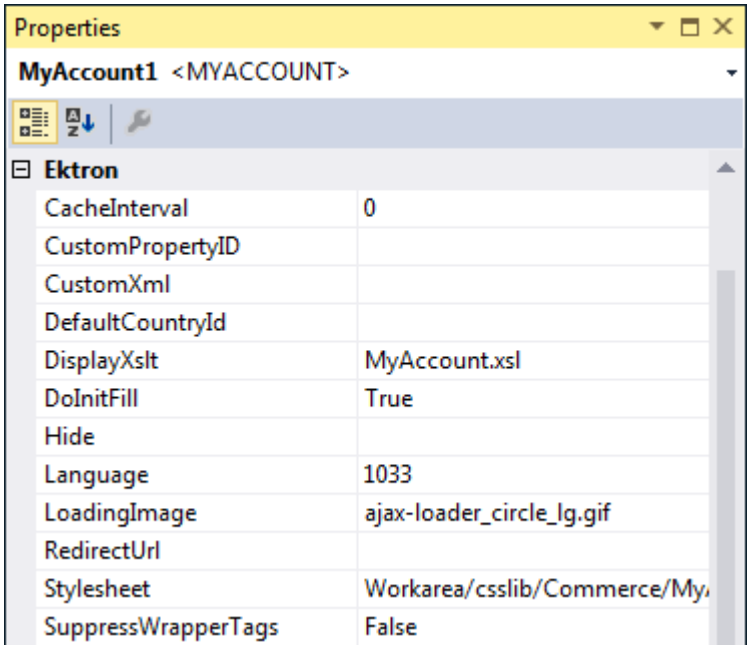
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.

3. Drag the **MyAccount** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:MyAccount ID="MyAccount1" runat="server" />
```

4. Click on `MyAccount` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



MyAccount properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomerPropertyID** (String)

  An ID or comma separated list of IDs for a Custom User Property (or properties) to expose in the UI. These properties are used to define information about a user beyond the standard Ektron user properties; such as Username, First Name, Password and email Address.

  IDs for these properties can be found in the **Workarea > Settings > Configuration > Custom Properties** screen. See also: Custom User properties.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DefaultCountryID** (Integer)

  The ID of the default country that appears in the Billing Address and Shipping Address. Set this ID to the country from which the majority of your customers will be making purchases. If the customer is from a different country, the customer can it change when editing the Billing or Shipping Address.

  NOTE: If a customer enters information in the Billing Address area, the Billing Country seeds the Shipping Country when adding a new Shipping Address.

  To find a country's numeric ID, sign into the Workarea. Then go to **Settings > Commerce > Configuration > Countries**. The Numeric ID is in the left column of that screen.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `MyAccount.xsl`. This file is located in *`siteroot`*`\Workarea\Xslt\Commerce`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LoadingImage** (String)

  The image to display while the control is fetching data. The default is *`siteroot`*`\Workarea\images\application\ajax-loader_circle_lg.gif`.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **RedirectUrl** (String)

  Enter the path of a template that contains the Login server control. When a customer arrives at this control and is not logged in, the control checks this property for a path to template containing a Login server control. If one exists, the customer is sent to that template. When the customer logs in, the template containing the MyAccount server control appears. If no path exists, the control checks the `web.config` file's <addkey="ek_RedirectToLoginURL"value=""/> value for a path.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

Editing personal information

The Personal Information area lets customers view and edit some information contained in their profile. By default, a customer can edit their First Name, Last Name, email Address, and Password. By adding a list of Custom User Property IDs to the `CustomPropertyID` property, you can let customers view and edit custom properties in their profile. See also: Custom User properties.

A customer can change the information in the Personal Information area by clicking **Edit** in the lower left corner of this area. The resulting page lets the person change any information in this area. When done, the customer clicks **Save Changes** to save the changes and return to the My Account page.

Editing a billing address

The Billing Address area lets customers view and edit their billing address information. A customer can edit their Name, Company, Address, City, State, Postal Code, Country, and Phone number. This information is used for billing purposes when the customer makes a purchase. Credit card companies typically want part or all of this information to match a customer's credit card account information when making a purchase.

To edit a customer's billing address, click **Edit** in the lower left corner of the Billing Address area.The resulting page let the person change any information in this area.

When done, a customer clicks **Save Changes** to save the changes and return to the My Account page.

Editing a shipping address

The Shipping Address area lets customers view, edit, delete or add a new address to their shipping address information. The fields in this area are the same as those in the Billing Address area with 2 exceptions: a **Same as Billing** check box, and a **Default Address** check box. The **Same as Billing Address** check box lets customers place a check mark in the box and use their billing address information as their shipping address. The **Default Address** check box lets customers specify the current shipping address as the default they want to use when making future purchases.

To edit a customer's shipping address, click **Edit** in the lower left corner of the Shipping Address area. The resulting page let the person change any information in this area. Note that a customer must uncheck **Same as Billing** to be able to edit the shipping address. Otherwise, it is locked to the billing address. When done, a customers clicks **Save Changes** to save the changes and return to the My Account page.

Adding a shipping address

To add a new shipping address, the customer clicks **Add New Address** located in the bottom center of the Shipping Address area.The resulting page lets the person enter new shipping address information. Note that the **Same as Billing** checkbox is not available when adding a new address. When done, a customer clicks **Save Changes** to save the changes and return to the My Account page.

Deleting a shipping address

To delete a shipping address, the customer clicks **Delete Address** at the bottom of the Shipping Address area. The visitor is asked to confirm. If the customer does and there are no other shipping addresses, the billing address is used as the shipping address. If the shipping address is the same as the billing address, you cannot delete it.

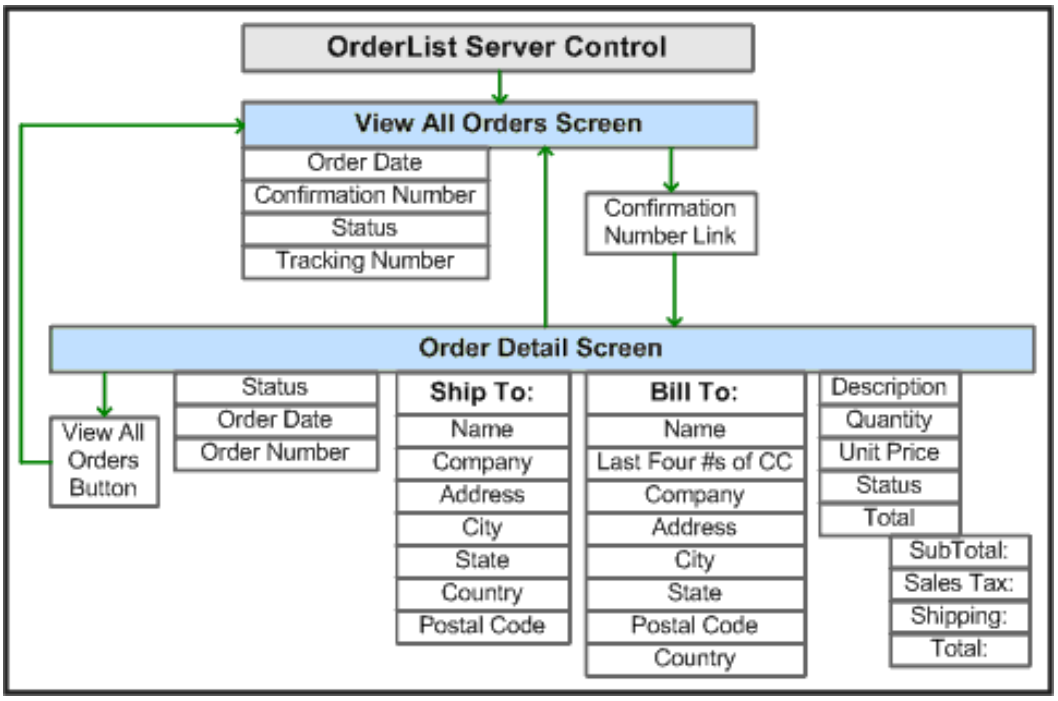
OrderList

8.50 and higher

The OrderList server control lets customers view a list of processed orders. Customers typically reach this server control by clicking a link on your site, such as the **View Order History** link.

Customers also can reach this control through a link at the end of the Checkout process. The link appears when the Checkout server control's `TemplateOrderHistory` property contains the path to the template containing the OrderList server control.

The following image depicts the flow of the OrderList server control.



Inserting the OrderList server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

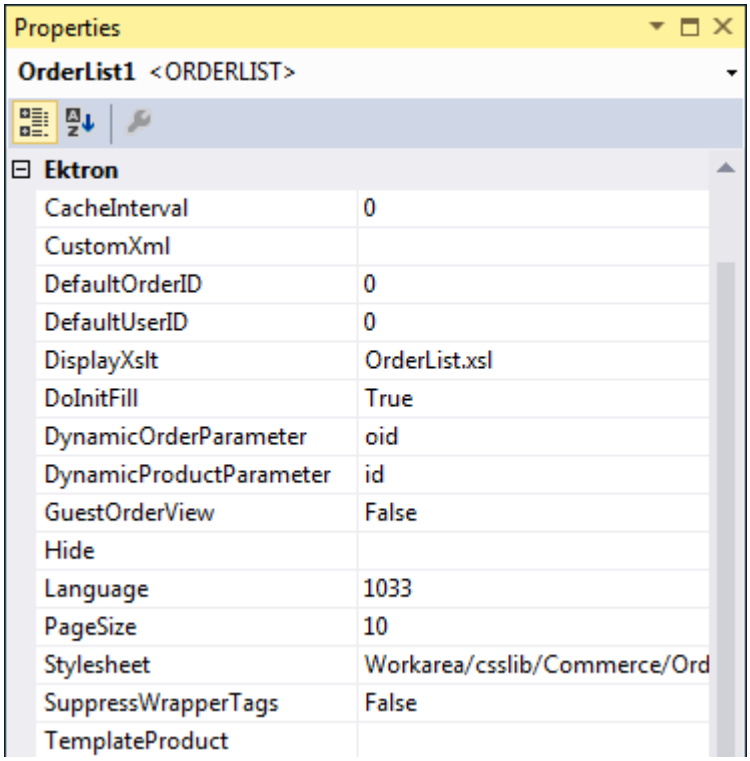
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **OrderList** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:OrderList ID="OrderList1" runat="server" />
   ```

4. Click on `OrderList` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



OrderList properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **CustomXml** (Code-behind Only) (String)
  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.
- **DefaultOrderId** (Long)
  The default ID of the list of orders to display.
- **DefaultUserId** (Long)
  The default ID of the user for which to display a list of orders.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `OrderList.xsl`. This file is located in *`siteroot`*`\Workarea\Xslt\Commerce`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicOrderParameter** (String)

  Sets the QueryString parameter name which is used to pass an order ID dynamically. By default, this parameter is OID.

- **DynamicProductParameter** (String)

  The QueryString parameter name which is used to pass the product ID to the product details page. For example, if your QueryString parameter for products is ID, enter that in this property. Then, when customers click a product in their order list, this parameter is passed with the product's ID to the product details page.

- **GuestOrderView** (Boolean)

  Set to **true** to allow guest account visitors to view their orders. If you do, a visitor can go to the View Orders screen, enter an order number and an email address, then view all submitted orders. See also: *Viewing a customer orders list* on the next page.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **PageSize** (Integer)

  The maximum number of orders to show per page.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder

outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateProduct** (String)
  The URL path of the template that allows a customer to view the details of a product in an order. When a path is entered, the product's title becomes a link that lets customers navigate to the template containing details of the product; for example, the template containing a Product server control.

Viewing a customer orders list

When customers arrive at this server control, they see the View All Orders portion of the server control.

This part of the server control displays a list of submitted orders. Customers can view each order's date, confirmation number, and status. When the number of orders exceeds the number defined in the `MaxResults` property, the list is paged and a user can navigate among pages with the links provided.

A customer can click the confirmation number to view the Order Details screen.

Order Status

Status: OnHold
Order Date: Wednesday, October 01, 2008
Order Number: 3

View All Orders

Ship To:	Bill To:
Admin 542 Amherst Street (Route 101A) Nashua, New Hampshire United States 03063	Admin **********1111 542 Amherst Street (Route 101A) Nashua, New Hampshire United States 03063

Description	Qty	Unit Price	Status	Total
Atrium Lounge Chair	1	$300.00	OnHold	$270.00
			Subtotal:	**$270.00**
			Coupon Total:	($30.00)
			Tax:	$0.00
			Shipping:	$50.00

To navigate back to the list of all orders, customers click **View All Orders**.

Viewing order details

- **Status**. The status of the order.
- **Order Date**. The date the order was submitted. This is the date an order went through the checkout process.
- **Order Number**. The order's ID number.
- **Ship To:**. Information needed to ship the order to customer.
  - Person to whom the product is being shipped
  - Company Name (optional)
  - Street Address
  - City and State or Region
  - Country
  - Zip Code
  - Tracking Number. This field appears if a tracking number has been entered in the View Order screen in the Workarea.
- **Bill To:**. Displays information about who is being billed for the order.
  - Person paying for the order
  - Credit Card information. For security purposes, only the last 4 digits appear.
  - Company Name (optional)

  - Street Address
  - City and State or Region
  - Country
  - Zip Code
- **Description**. A list of products in the order. When the path to the product server control is entered in the `TemplateProduct` property, the product's title becomes a hyperlink.
- **Quantity**. The total number of each product.
- **Sale Price**. The per unit price of each product.
- **Total**. The total amount paid for each product ordered. This is the Unit Price multiplied by the Quantity.
- **Subtotal**. The sum of all the order's line products before additional charges or discounts, such as tax, shipping and coupons.
- **Coupon Total**. The total amount discounted, based on all applied coupons.
- **Tax**. The tax amount applied to this order. See also: Configuring eCommerce.
- **Shipping**. The amount charged to ship the order to the recipient. See also: Configuring eCommerce.
- **Total**. The sum of all charges, including all line items, tax, shipping and handling.

Product

8.50 and higher

The Product server control lets customers view the details of a product and add it to their cart. To display a product on a Web page, drag and drop a Product server control on a template and enter a product ID in the `DefaultProductID` property. You could also dynamically pass a product's ID to the control by setting `DynamicProductParameter` property to the `QueryString` parameter used for product IDs.

This control handles each class of product Ektron provides such as Products, Kits, Bundles or Subscriptions without having to make any adjustments to the control.

Customers typically reach this server control when they click a product from either the ProductSearch or ProductList server control. When customers clicks a product, title or image in either of these controls, they are forwarded to the Product server control.

In addition, customers can reach this control from the Cart server control. In that control, customers click a product's title and are taken to the Product server control.

When a customer has viewed the product and decided to purchase it, they click **Add to Cart** in the control.

Inserting the Product server control onto a page

PREREQUISITE

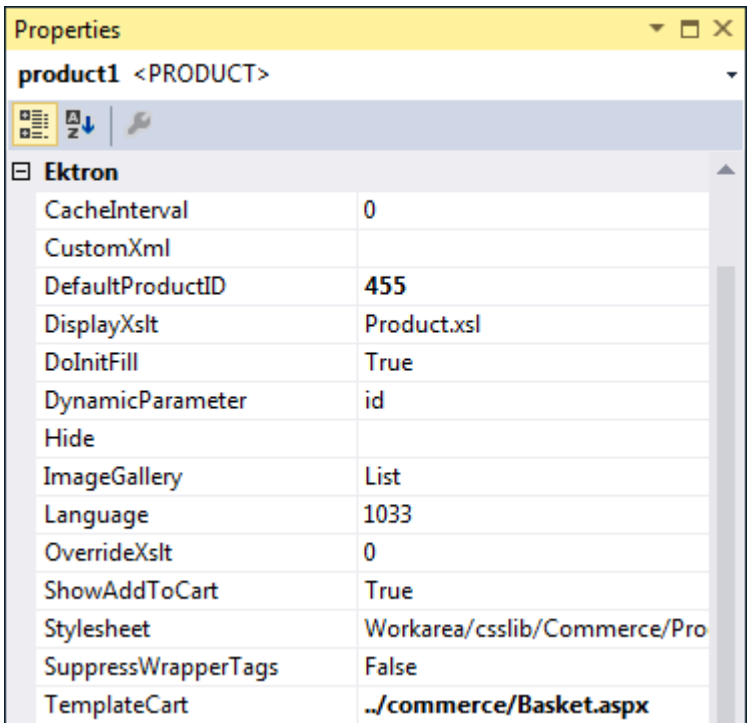
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Product** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Product ID="Product1" runat="server" />
```

4. Click on `Product` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Product properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DefaultProductID** (Integer)

  Enter a default product's ID. This is the default product that's displayed when the template containing this control is viewed by a customer and a product ID is not dynamically passed. To make this server control dynamic, enter zero (0) for this property and set the `DynamicProductParameter` to the QueryString parameter used to pass the product ID.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `product.xsl`. This file is located in *`siteroot`*`\Workarea\Xslt\Commerce`. See also: *The OverrideXslt and DisplayXslt properties* on the facing page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  The QueryString parameter name, which is used to read the product ID. For example, if your QueryString parameter for products is ID, enter that. Then, when customers view a product's details, the product's ID is passed to this control.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **ImageGallery** (ImageGalleryType)

  Determine if the image gallery appears along with a product's information. Images that appear in the gallery are set in the product's Media tab when creating or editing a product. The Gallery Display property for each image on the Media tab must be set to Yes. Choices:

- **List**. Display gallery images
- **None. H**ide gallery images

In the Image Gallery, images are displayed at their smallest size. If a customer clicks an image, a full size version appears.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **OverrideXslt** (Integer)

  Specifies an XSLT identified in the Edit Product Type Configuration screen.

- **ShowAddToCart** (Boolean)

  Set to true if you want to the **Add to Cart** button to appear. The default is True. Setting this property to false lets you show details of a product, but not offer it for sale. For example, a product is no longer for sale, but you want to allow people who purchased it to view details. Also, by using code-behind to dynamically set the property, you could create code that checks your inventory system and hides the button if a product is out of stock. You could also accomplish this for a product by removing the check from the **Buyable** property when creating or editing a product in the Workarea.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TemplateCart** (String)

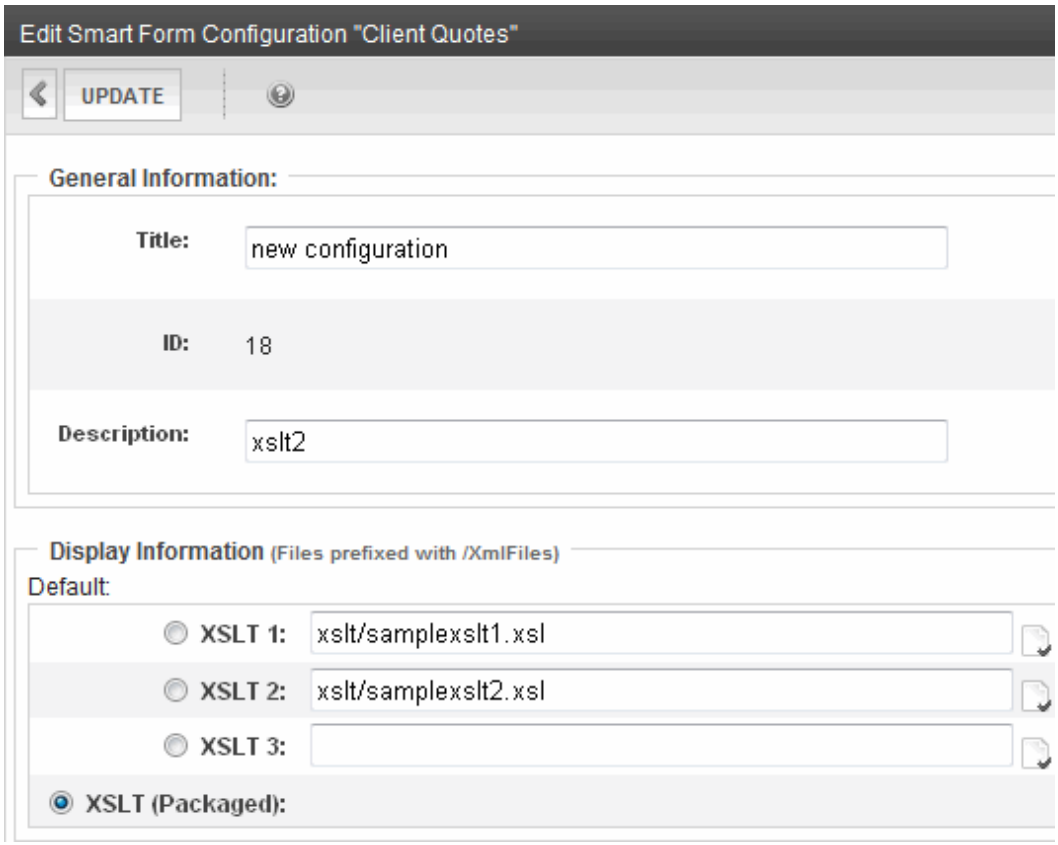
  Enter the URL path of the template that contains the *Cart* on page 2359 server control. The path can be relative or absolute.

The OverrideXslt and DisplayXslt properties

The `DisplayXslt` property is optional. If used, it specifies an external XSLT file. If the `DisplayXslt` property is not defined, the `OverrideXslt` property specifies an XSLT identified in the Edit Product Type screen. The following list provides more information about these properties.

- The default XSLT is specified in the Edit Smart Form Configuration screen. To use this display XSLT, enter 0 for OverrideXslt.

  NOTE: In this example, the XSLT Packaged option is the default XSLT, since it is selected. XSLT Packaged is the XSLT from the Edit Smart Form Configuration screen (that is, the XSLT created in the Data Designer).



- **XSLT 1** from the Edit Smart Form Configuration screen; to use this display XSLT, enter 1 for OverrideXslt.
- **XSLT 2** from the Edit Smart Form Configuration screen; to use this display XSLT, enter 2 for OverrideXslt.
- **XSLT 3** from the Edit Smart Form Configuration screen; to use this display XSLT, enter 3 for OverrideXslt.
- An absolute or relative path to an XSLT file. For DisplayXslt, enter an external XSLT file not specified in the Edit Product Type Configuration screen. For example: `sample.xslt`. No value is required for OverrideXslt. If an XSLT value exists, **OverrideXSLT** is ignored.

IMPORTANT: Files stored in the *siteroot*`\Workarea` folder are overwritten (or deleted) when you upgrade. To avoid problems, back up the files to a folder outside the `siteroot\Workarea` folder.

Displaying a product

A *product* is an item that has no kit, bundle or subscription information associated with it.

When displaying a simple product, the Product server control displays the following information:

- **Title** (optional). The **Title** field in the product's Smart Form. A content editor enters this information when creating a product in the Workarea. This area does not use the title of the product in Ektron's Workarea.
- **Description** (optional). The Description field in the product's Smart form. A content editor enters this information when creating a product in the Workarea.
- **Image Gallery**. The Media tab when creating or editing a product. The Gallery Display property for each image on the Media tab must be set to Yes. In the Image Gallery, images are displayed at their smallest size. When a customer clicks an image, the full size version appears. See also: *ActiveTopics* on page 2165.
- **Price**. The Pricing tab when creating or editing a product. This is the price defined in the **Our Sales Price** area. This is not the list price. See also: *ActiveTopics* on page 2165.
- **Add to Cart**. This button appears in the server control when:
  - a path to the Cart server control is defined in the `Templatecart` property
  - the product is buyable. When a product is not buyable, information about the product appears, but customers cannot add it to their cart. This property is set in the Workarea when creating or editing a product.
  - the `ShowAddToCart` property is set to True

  When customers click this button, the product is added to their cart and they are sent to a template containing the Cart server control.

You can hide this button by setting the `ShowAddToCart` property to false. This lets you show details of a product, but not offer it for sale. For example, you have a product that is no longer for sale, but you want to allow people who purchased the product to view its details.

Also, by using code-behind to dynamically set the property, you could create code that looks at your inventory system and hides the button depending on whether a product is in stock.

Using the Add to Cart button with aliasing

When a product has an alias path associated with it:

- Make sure the `TemplateCart` property's path is relative to the site root. For example:

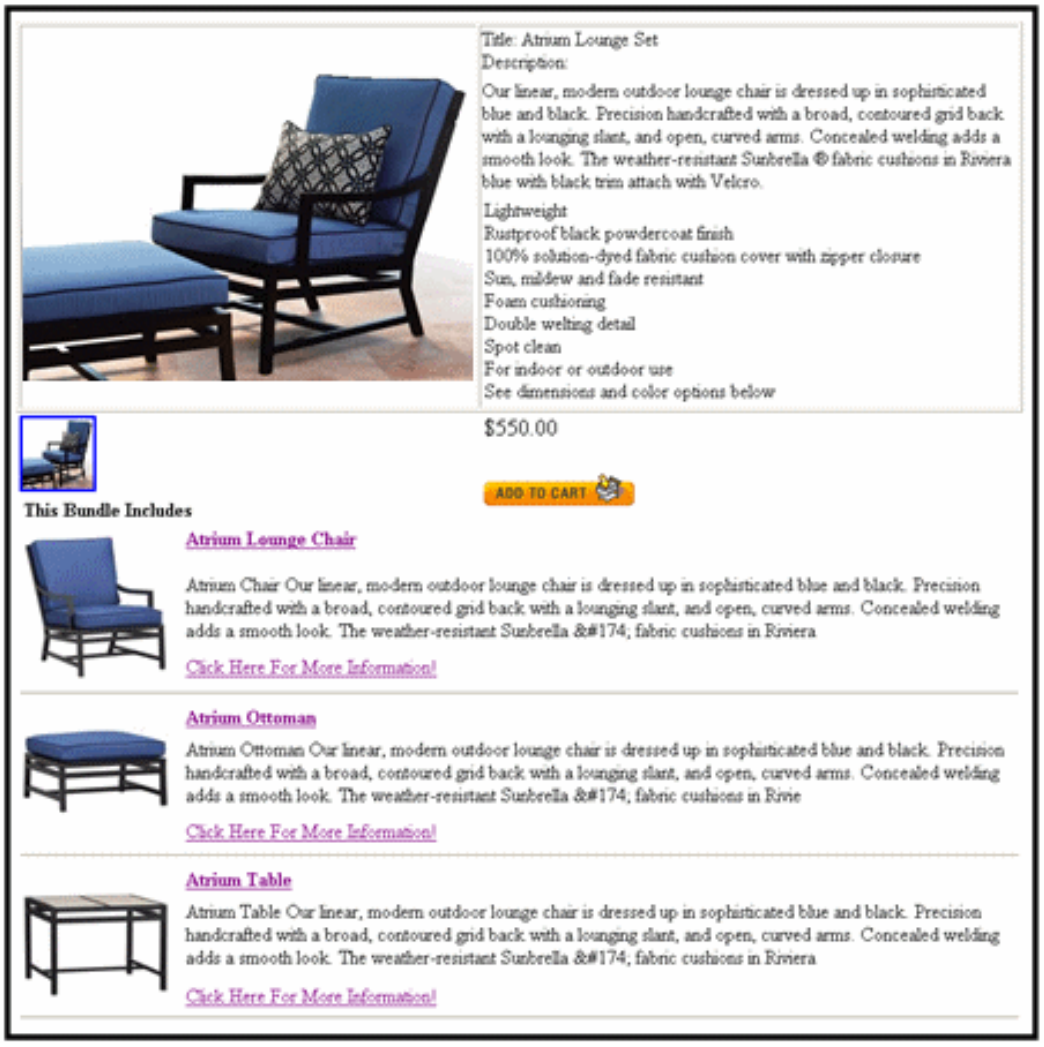
```
TemplateCart="Developer/Commerce/CartDemo.aspx"
```

- Add the following to the code-behind page. This example is in C#:

```
protected void Page_Init(object sender, EventArgs e)
{ Utilities.RegisterBaseUrl(this.Page); }
```

Displaying a bundled product

A bundled product is made up of multiple products that have been grouped together for sale as one product.



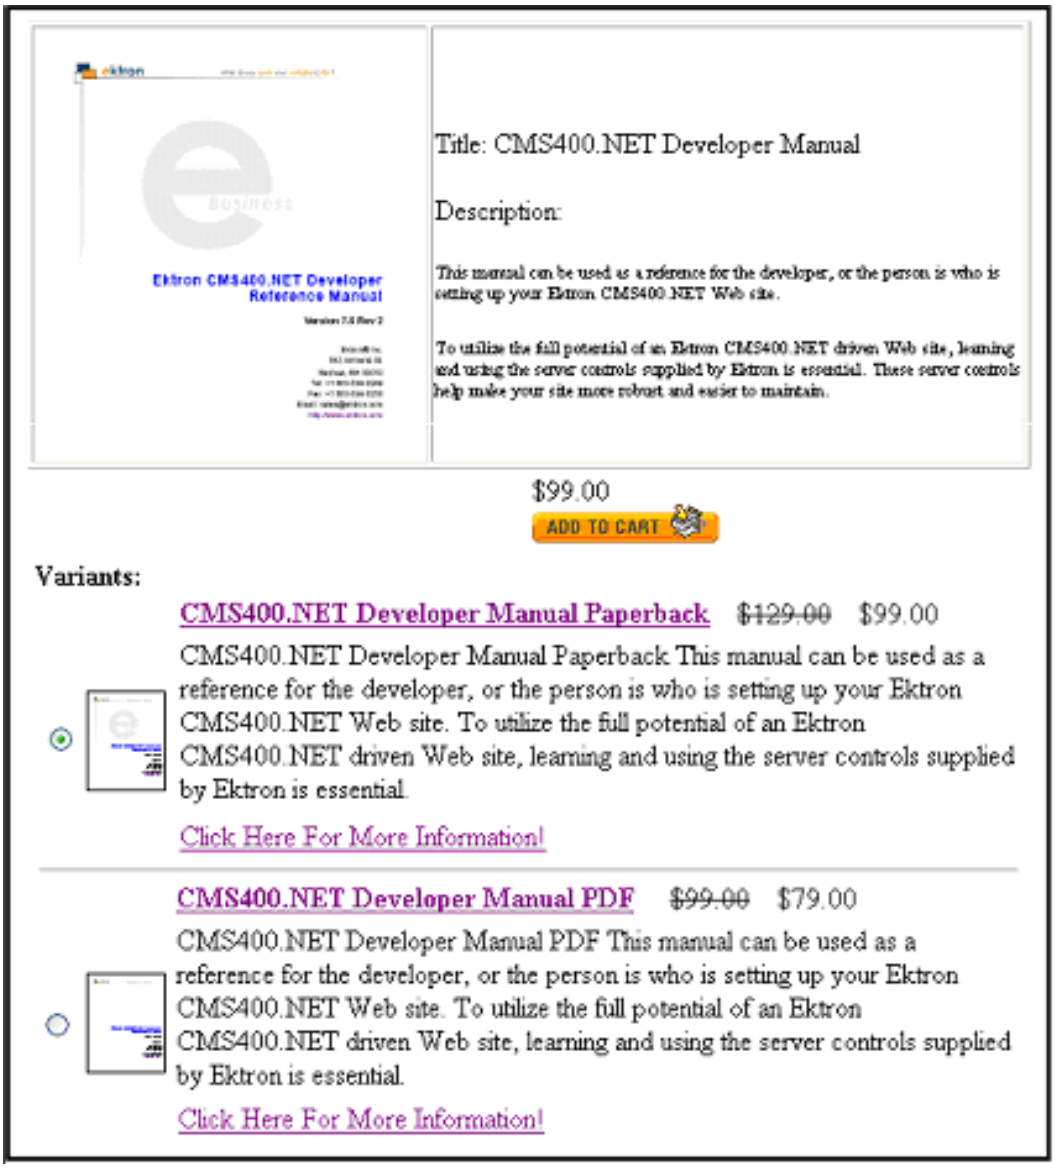
When displaying a bundled product, the Product server control displays all information displayed in a Product as well as information about the individual components of the bundle.

The **This Bundle Includes** area includes products listed on the **Items** tab for a Product Bundle in the Workarea. A content editor adds existing products to this tab when creating the bundle.

Any products on the tab are displayed with the image, title and description for each product. A link to additional information about each product is also displayed.

Displaying a complex product

A Complex Product lets the customer choose between variations of a product. For example, if your site sells books, variant selections might be Paperback or Electronic.

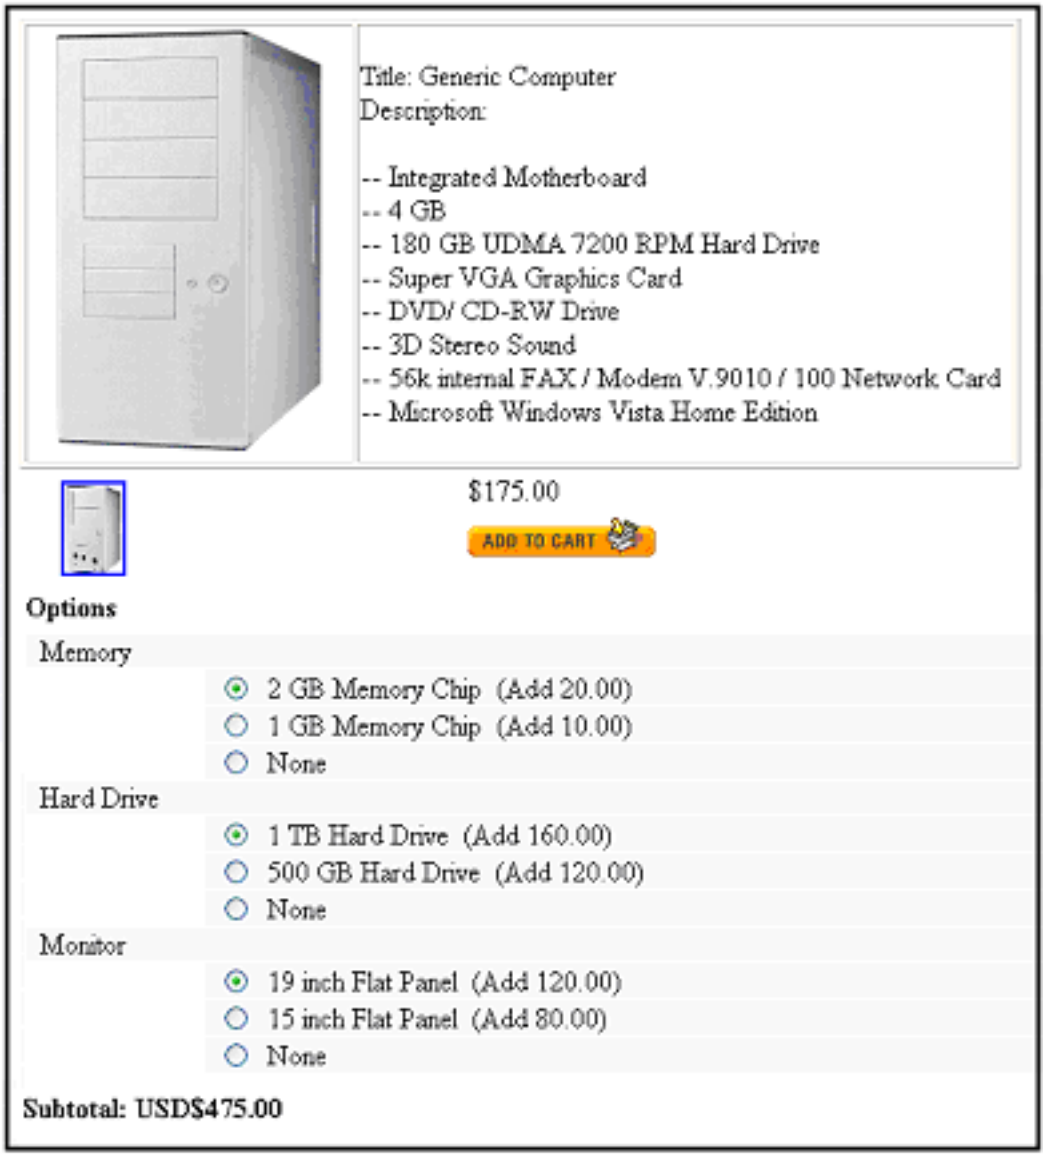


When displaying a Complex Product, the Product server control displays all of the information displayed in a Product in addition to information on product variants. The **Variants** area includes products listed on the **Items** tab. A content editor adds products to this tab when creating content.

Products on the **Items** tab are displayed with a radio button, image, title and description. A link to additional information about each product is also displayed. The radio buttons are used to select which product will be added to the cart.

Displaying a kit

A kit lets the customer select product options, which can affect the product's price. There is no limit to the types of options you can add, nor to the number of items in an option. For example, a customer purchasing a computer can add RAM, a hard drive, and a larger monitor.



When displaying a kit, the Product server control displays all information displayed in a product in addition to options and subtotal information.

The **Options** area displays product options based on the Item tab for a kit in the Workarea. Options are divided into groups. A radio button, name and price appears for each item. The radio button lets you select one item from each group.

The **Subtotal** area shows the updated cost of the product with all options.

ProductList

8.50 and higher

The ProductList server control displays a list of products on a Web page.

NOTE: Private catalog entries appear in display of the Product List server control only if the user is logged in and has at least Read-Only permissions for its catalog folder. Making Content Private

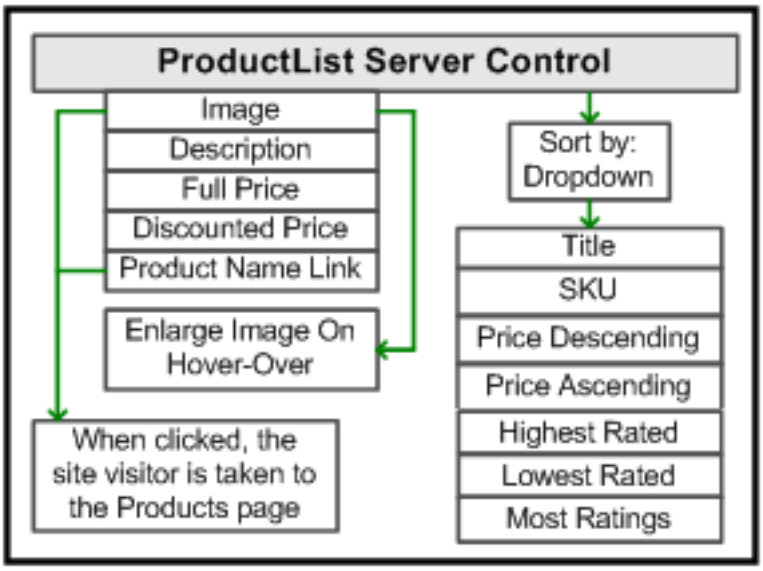
You decide which products appear by selecting a `SourceType` and populating either the `SourceId` or the `IdList` property, depending on the source type. You can choose from these source types.

If you want to display	Set the SourceType property to	In the `SourceId` property, enter	In the `IdList` property, enter
All products for a selected catalog	Catalog	The ID of the catalog	
All products across multiple catalogs	CatalogList		A comma separated list of catalog IDs
All products for a selected taxonomy	Taxonomy	The ID of the Taxonomy	
All products across multiple taxonomies	TaxonomyList		A comma separated list of taxonomy IDs
All products for a selected collection	Collection	The ID of the Collection	

If you want to display	Set the SourceType property to	In the `SourceId` property, enter	In the `IdList` property, enter
Display a list of products	IdList		A comma separated list of product IDs

There are several ways customers might arrive at the ProductList server control, such as

- when a list of products appears on the side of a page
- through a link in a master page
- when they click **Continue Shopping** on the Cart or Checkout server control.



Inserting the ProductList server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

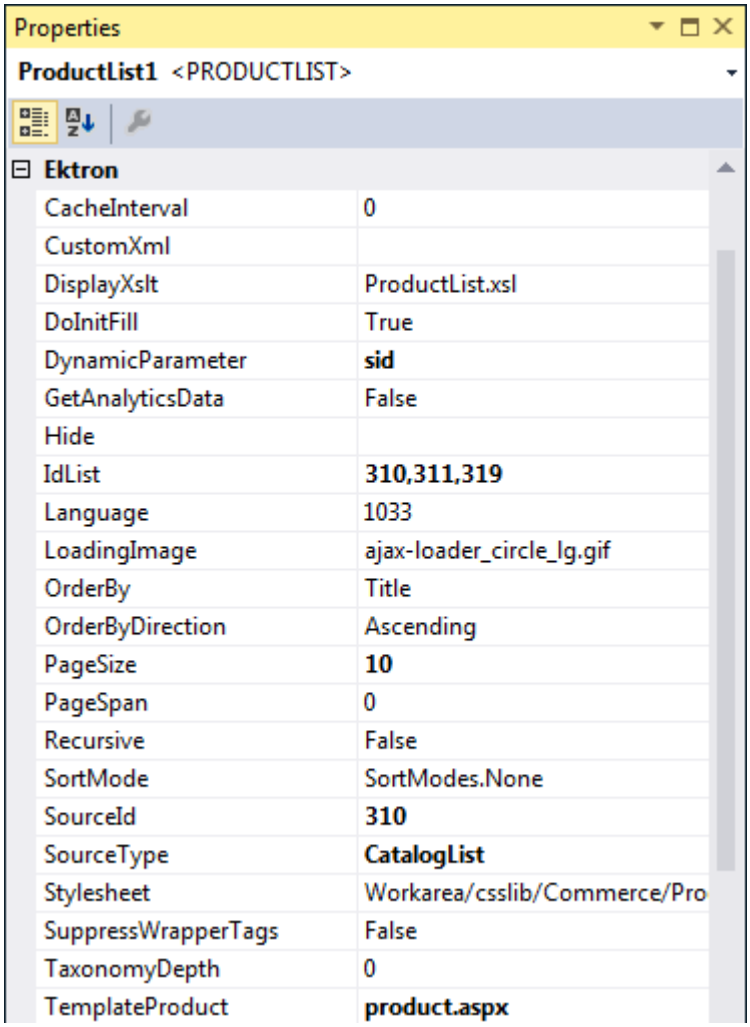
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ProductList** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:ProductList ID="ProductList1" runat="server" />
   ```

4. Click on `ProductList` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



ProductList properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `ProductList.xsl`. This file is located in *siteroot*`\Workarea\Xslt\Commerce`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Sets the QueryString parameter to read a source's ID dynamically. For example, if your QueryString parameter for a source ID is SID, enter that.

- **GetAnalyticsData** (Boolean)

  Set to `true` if you want the average rating for this product to appear with the product display, as shown below.

  
  Below the rating, a number indicates how many customers have rated the product. For information on customer product ratings, see *ContentReview* on page 2342.

  IMPORTANT: This property provides reliable data only when the Business Analytics feature is on.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IdList** (String)

  Enter a comma-separated list of IDs if the `SourceType` property is set to IdList, TaxonomyList or CatalogList.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LoadingImage** (String)

  The image to display while the Product List is loading. The default is *siteroot*`\Workarea\images\application\ajaxloader_circle_lg.gif`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **OrderBy**

  (*SortMode* property must be set to **None**)

  For further definition of the values shown here, see the **entryPropertyenumeration** in the **API documentation**.

  - **AverageRating**
  - **CatalogId**
  - **CollItemsDisplayOrder** (only available if `SourceType` property = Collection)
  - **ContentStatus**
  - **CurrencyId**
  - **EndDate**
  - **EntryType**
  - **GoLIve**
  - **Html**
  - **Id**
  - **IsArchived**
  - **IsBuyable**
  - **IsPublished**
  - **LanguageId**
  - **LastEditDate**
  - **LastEditorFirstName**
  - **LastEditorLastName**
  - **ListPrice**
  - **Media**
  - **NumberRated**
  - **ProductTypeId**

- **SalesPrice**
- **Sku**
- **Status**
- **Summary**
- **TaxClassId**
- **TaxItemsDisplayOrder** (only available if `SourceType` property = Taxonomy)
- **Title**
- **ViewCount**

- **OrderByDirection** (String)
  Select the direction of the `OrderBy` property. Choose Ascending or Descending.
- **PageSize** (Integer)
  Specify the number of items to show per page when a customer views the product list. If the number of items exceeds the quantity defined in this property, the list is paged and the customer can use the paging navigation system to move through the list.
- **PageSpan** (Integer)
  The number of pages to show before and after the current page. Enter zero to show all pages. For example, if you set this property to 2 and you are on page four of the product list, you see:

- **SortMode** (SortModes)
  Select the default way the product list is sorted when a customer first views the page. When the page is loaded, a customer can change the sort via a drop-down list. Choices are:
  - **Title**. Sorts in alphabetical order.

  - **SKU**. Sorts by the product number. This number is typically a unique number supplied by the producer of the product.
  - **Price Descending**. Sorts by price from highest to lowest.

- **Price Ascending**. Sorts by price from lowest to highest.
- **Highest Rated**. Sorts by rating from highest to lowest.
- **Lowest Rated**. Sorts by rating from lowest to highest.
- **Most Rated**. Sorts by products that have most ratings from highest to lowest.
- **None**. Use this setting to use *OrderBy* property.

See also: *Sorting the product List* on the facing page.

- **SourceId** (Integer)

  The ID of the catalog, collection or taxonomy that is being used as a product list. This property is used when the `SourceType` property is set to **Catalog**, **Collection** or **Taxonomy**.

- **SourceType** (SourceObjectType)

  The type of source being used to create the list. Choices are:

  - **Catalog**. Use the `SourceId` property to specify the ID of a single catalog when this source type is selected.
  - **CatalogList**. Use the `IdList` property to specify a list of catalog IDs when this source type is selected.
  - **Taxonomy**. Use the `SourceId` property to specify the ID of the single taxonomy when this source type is selected.
  - **TaxonomyList**. Use `IdList` property to specify a list of taxonomy IDs when this type is selected.
  - **IdList**. Use the `IdList` property to specify a list of product IDs when this source type is selected.
  - **Collection**. Use the `SourceId` property to specify the ID of a collection when this source type is selected.

- **Stylesheet** (String)

  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TaxonomyDepth** (Integer)

  Enter the number of taxonomy levels to retrieve below each taxonomy/category. Only the top level appears in the control. The rest of the levels are available through XML in Code-behind. For example, if the taxonomy is **DVDs > Movies > Comedies**, and you set **Taxonomy Depth** to **2**, only DVDs and Movies are available in Code-behind.

To retrieve all categories for a taxonomy recursively, enter -1. A depth greater than 1 or using -1 is only useful if you create a custom output using the Taxonomy's XML. The default value is 1.

For a live site, Ektron strongly recommends leaving this value at **1**. Increasing this value can slow down your live Web server. However, for testing on a staging server, you can increase the depth.

- **TemplateProduct** (String)
  Specify the URL that contains the Product server control. This allows a customer to see the details of the product when the product link is clicked.

Sorting the product List

The ProductList server control lets a customer sort by:

- Title
- SKU
- Price High to Low
- Price Low to High
- Highest Rated
- Lowest Rated and Most Ratings

You can set the default sort order by setting the `SortMode` property.

For the Highest Rated, Lowest Rated and Most Ratings sorting options to work as intended, a ContentReview server control should be associated with each product. This lets customers rate your products.

For example, place a ContentReview control on the Master page of the template that display products, and set its `DynamicParameter` property to `ID`. Then, when customers view the product, they can rate and comment on it.

Recommendation

8.50 and higher

PREREQUISITE

Cross sell or upsell products have been assigned to a catalog entry.

The Recommendation server control lets you cross-sell or up-sell products to a customer based on another product's ID. After you create a product in the Workarea, you can define a list of other products that you want to associate with the new product. While viewing a product in the Workarea, choose **View > Cross Sell** or **Up sell**. Then, by adding the Recommendation server control to a Web form that contains a Product server control, the customer sees the recommendations when viewing the original product's details.

Typically, this control appears on a page along with a Product server control. By using this control in conjunction with the Product control, a customer can view the

details of a product and also receive suggestions on additional purchases. A customer can click the title to view the suggested product to view its details.

For example, if your site is selling a hat, mitten and scarf set, you might use this server control to cross-sell winter jackets. You could also use the control to up-sell a more expensive hat, mitten and scarf set, or a set that includes additional items.

The `RecommendationType` property determines whether the Recommendation server control is used for up-selling or cross-selling.

Inserting the Recommendation server control onto a page

PREREQUISITE

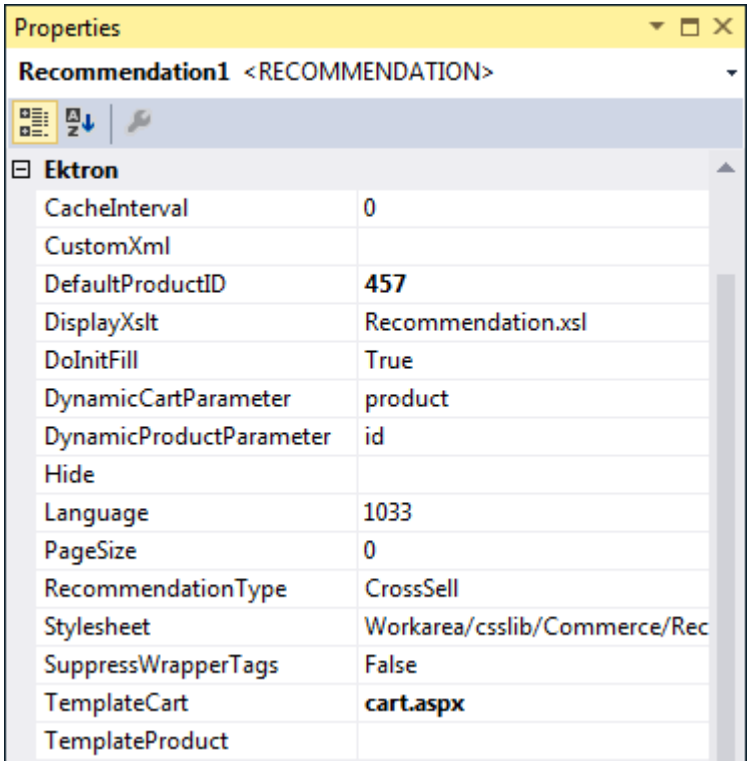
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Recommendation** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Recommendation ID="Recommendation1" runat="server" />
```

4. Click on `Recommendation` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Recommendation properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomXml** (Code-behind Only) (String)

  Lets you inject custom XML into the generated XML before being processed by the XSLT. Enter a string of XML that you want to make available to the XSLT as follows:

  ```
  <root><customXml>custom-xml-inserted-here</customXml></root>
  ```

  See also: *Displaying custom XML in Ektron's server controls* on page 2162.

- **DefaultProductID** (Integer)

  Enter a default product ID that contains either cross sell or up sell products. To make the server control dynamic, enter zero (0) in this property and set the `DynamicProductParameter` to QueryString parameter used to pass the product's ID.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. By default, the control uses `Recommendation.xsl`. This file is located in *`siteroot`*`\Workarea\Xslt\Commerce`.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicCartParameter** (String)

  The QueryString parameter name which is used to pass the product ID to the Cart server control. For example, if your QueryString parameter for products is Product, enter that in this property. Then, when customers click **Add to Cart**, this parameter is passed with the product's ID Web form containing the *Cart* on page 2359 server control.

- **DynamicProductParameter** (String)

  The QueryString parameter name which is used to pass the product ID to the product details page. For example, if your QueryString parameter for products is ID, enter that in this property. Then, when customers click a product's title, this parameter is passed with the product's ID to the product details page.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

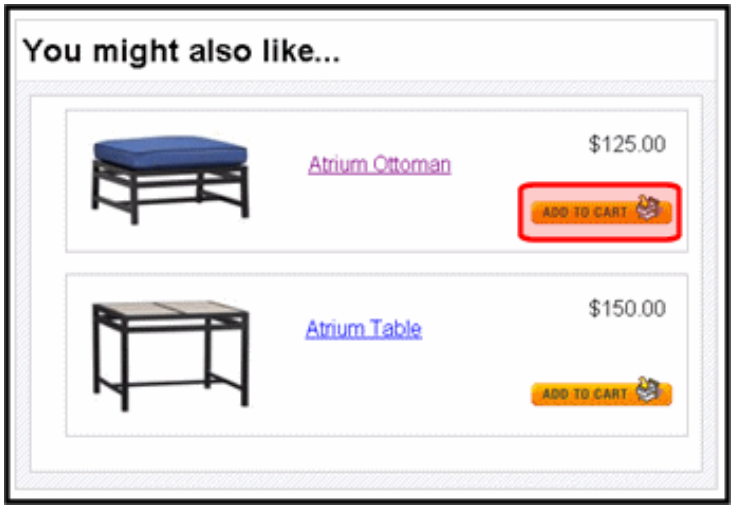
  If the template on which this server control resides includes a language selection control, and you want to let the customer select the language, enter zero (0).

  Otherwise, click the field, then the **ellipsis** button () and a popup box appears. Select a language from the list. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **PageSize** (Integer)
  Specify the number of items to show per page when a customer views recommendations. If the number of items exceeds the quantity defined in this property, the list is paged and the customer can use the paging navigation system to move through the list.
- **RecommendationType** (`EkEnumeration.RecommendationType`)
  The type of recommendation to show. Choices are:
  - **CrossSell**. Related products that a customer might be interested in. For example, if you are selling Denim Jackets, you might want to cross sell them pants or shirts.
  - **UpSell**. Products that improve on the product being purchased. For example, if you are selling 7 megapixel digital cameras, you show a 10 megapixel digital camera.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.
- **SuppressWrapperTags** (Boolean)
- Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateCart** (String)
  The URL to navigate to when a customer clicks **Add to Cart**. The path can be relative or absolute. When a path is entered, the **Add to Cart** button appears next to the product and allows a customer to add the product directly to their cart.
- **TemplateProduct** (String)
  Specify the URL that contains the Product server control. This allows a customer to see the details of the product when the product link is clicked. The path can be relative or absolute.

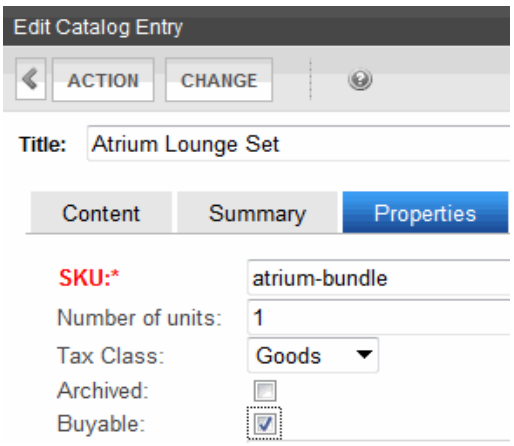
Enabling the Add to Cart button

Customers can add a product to their cart directly from the Recommendation server control by clicking **Add to cart** next to a product. This link appears below the price and allows them to skip the product's information page and add the product directly to their cart.

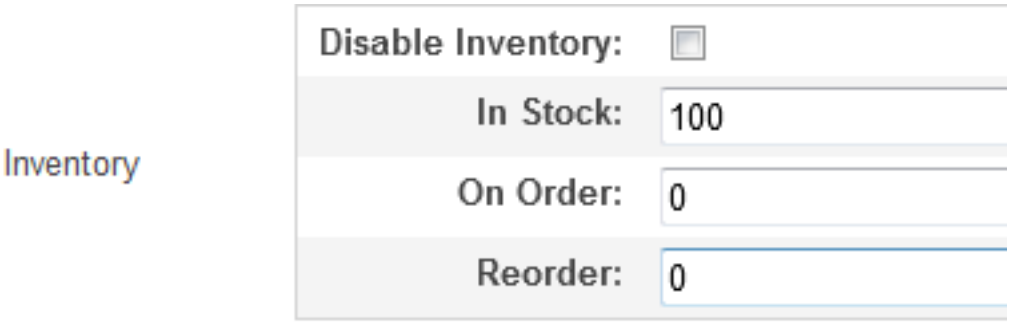


By default, this button appears when the following conditions are met:

- The product is buyable. That is, there is a check mark in the **Buyable** property for a product in the Workarea.



- The product has an **In Stock** quantity of at least one.



- The `TemplateCart` property has a cart's template location defined.

In addition, if a product has an alias path associated with it, you need to:

- Make sure the `TemplateCart` property's path is relative to the site root. For example:

```
TemplateCart="Developer/Commerce/CartDemo.aspx"
```

- Add the following to the code-behind page. This example is in C#:

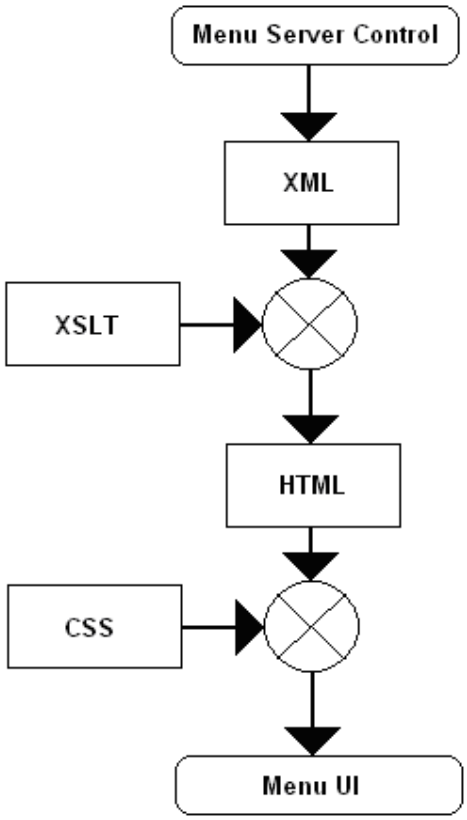
```
protected void Page_Init(object sender, EventArgs e)
{ Utilities.RegisterBaseUrl(this.Page); }
```

FlexMenu

8.50 and higher

IMPORTANT: Starting from release 8.6, the FlexMenu server control was replaced by the FrameworkUI: <ektron:MenuView> templated server control. If you are already using the FlexMenu server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The FlexMenu server control displays a menu on a Web form. A FlexMenu creates XML, so you can modify its behavior using an XSLT file, and change its appearance using a cascading style sheet (.css) file.



Before you can use this server control, you must create one or more menus in the Workarea. See also: *Menu* on page 2493, Contrasting Menu server controls.

This section also contains the following topics.

Inserting the FlewMenu server control onto a page

PREREQUISITE

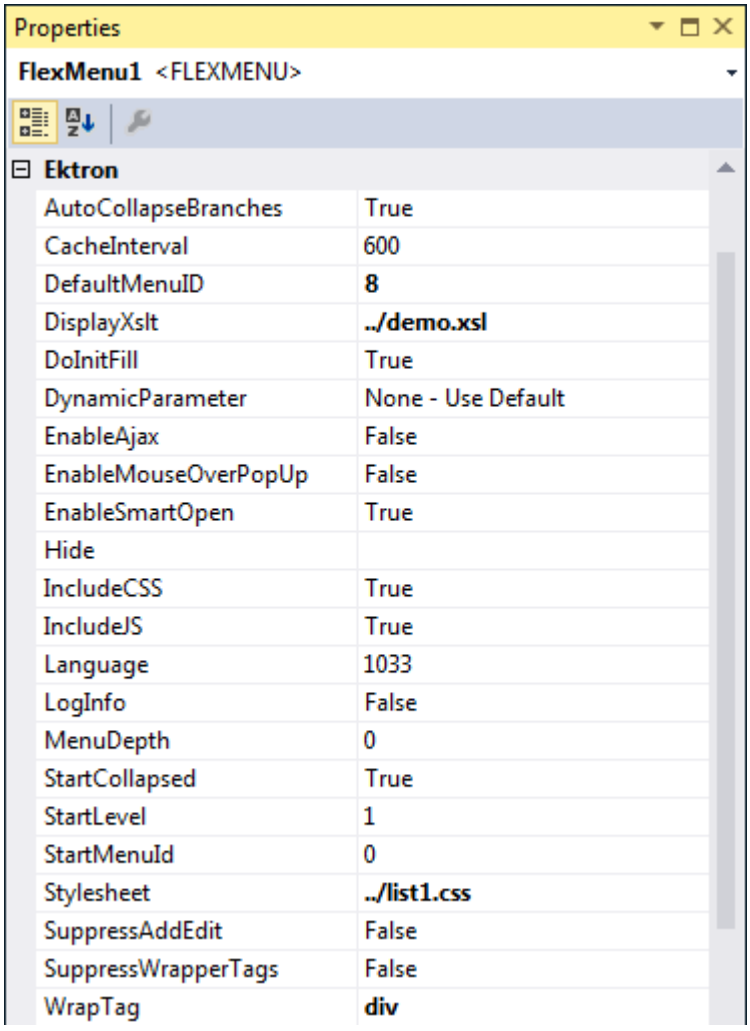
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **FlewMenu** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:FlewMenu ID="FlewMenu1" runat="server" />
```

4. Click on `FlewMenu` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



FlexMenu properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AutoCollapseBranches** (Boolean)
  - **True**. Whenever a new submenu opens, all other submenus close.
  - **False**. Other submenus remain open when a new one opens.
- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DefaultMenuID** (Long)

  The ID of a menu that appears where you insert this server control if no other menu is identified or available. If you don't know the ID number of the menu, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147

  NOTE: If you want to change the Default menu's Starting menu, use the StartMenuID property.
- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. If nothing is specified, the menu is output as raw XML. FlexMenus use an .xsl file to control the menu's behavior, and a .css file to control its display. Ektron provides several sample menus, and each has an xslt file. If this is a new menu, you may find it easier to copy and edit an xslt file provided with a sample menu. See also: *SampleMenu* on page 2496.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.
- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a FlexMenu ID dynamically. Set to **None. Use Default** if you want to always display the default menu.
  - **None. Use Default**. Use the default FlexMenu ID list.
  - **ekfrm**. Reads a form block's ID dynamically.

  - You may display FlexMenus dynamically by entering any value other than **id**. **id** is the default parameter for **PostParameter**.
- **EnableAjax** (Boolean)

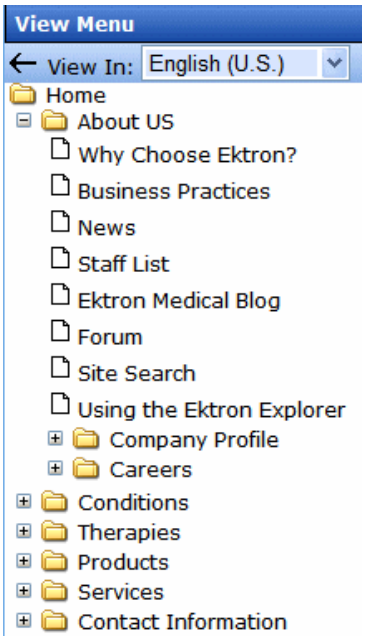
  Set to **True** to enable Ajax, which only downloads sub-menus as needed.
- **EnableMouseOverPopup** (Boolean)
  - **True**. Submenus appear as soon as the cursor moves over them.
  - **False**. Submenus only appear if a site visitor clicks them or a keyboard equivalent.
- **EnableSmartOpen** (Boolean)

  Lets you prevent submenus from opening by default. Under some circumstances, such submenus look cluttered.
  - **True**. Submenu can open automatically. To learn how to do this, see Assigning a Folder or Template to a Menu.
  - **False**. Even if all required conditions are present, submenus on a FlexMenu do not automatically open.
- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IncludeCSS** (Boolean)
  - **True**. Load the menu's cascading stylesheet (CSS).
  - **False**. Ignore the menu's CSS.
- **IncludeJS** (Boolean)
  - **True**. Load the menu's JavaScript.
  - **False**. Ignore the menu's JavaScript. This would be useful if you redefine the menu's output with an XSLT.
- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MenuDepth** (Integer)

  To let site visitors browse through all menu levels, enter zero (0). To restrict site visitors to a menu level, enter the number of the lowest level. In the following example, if you set this property to **1**, a site visitor can browse through the **About Us** menu options but would not see the level 2 options (**Company Profile** and **Careers**).



- **StartCollapsed** (Boolean)
  If you set to **True**, when the menu first appears, all submenus are closed.
- **StartLevel** (Integer)
  Enter a number to indicate the level at which you want this menu to display when it first appears. To begin the menu display at the root level, enter zero (0). In the following example, the **Home** folder is level 0. The others are level 1.

  A site visitor can click a menu option to navigate to folders below the displayed level.

  NOTE: If you set a StartMenuID, the StartLevel property is ignored.

- **StartMenuId** (Integer)
  Use this property to have the default menu begin somewhere other than its root. That is, at any submenu under the default menu. For example, menu ID 46 (Products) is the default menu. However when that menu displays, you only want to show its submenus, beginning with Products Support (ID 58). In this case, enter **46** into the `DefaultMenuID` property and **58** into the `StartMenuID` property.

NOTE: If you set a `StartMenuID`, the StartLevel property is ignored.

- **Stylesheet** (String)

  Enter the style sheet that will determine the appearance of the menus. FlexMenus use an .xsl file to control their behavior, and a .css file to control their display. Ektron provides several sample menus, and each has a .css file. If this is a new menu, you may find it easier to copy and edit a .css file provided with a sample menu. See also: *SampleMenu* on page 2496.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **SuppressAddEdit** (Boolean)

  When set to **True**, suppress the Add and Edit buttons on the menu when a user is logged in to Ektron. The default is False.

  - **True**. Suppress the Add and Edit button when a user is logged in to Ektron.
  - **False**. Show the Add and Edit buttons when a user is logged in to Ektron.

- **SuppressWrapperTags** (Boolean)

  This property is set to `false` because Ajax uses `<div>` tags to rewrite the region around the tag. You *cannot* change the value to `true`.

- **WrapTag** (String)

  Lets a developer specify a server control's tag.

  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Working with the FlexMenu Xslt file

This section explains some non-intuitive elements of the *.xslt file.

- MenuFragment

  ```
  <xsl:when test="/MenuDataResult/Info/menuFragment='false'">
  ```

  A flag that indicates the XML data is not complete. Instead, it's a fragment that begins deeper than the top level (for example, a submenu fragment).

  Because the data is incomplete, the XSLT processes the fragment differently. For example, don't generate JavaScript startup code.

- menuConst

  ```
  <xsl:attributename="id"><xsl:value-ofselect="$menuConst"/>0_
  ekflexmenu</xsl:attribute>
  ```

Each menu generates several elements, which the client code (JavaScript) accesses via a unique ID. For example, JavaScript needs to identify the selected submenu or item when a user clicks on an element.

`menuConst` is only used is when creating elements without a corresponding XML block, such as when creating a structure to hold the menu.

- #NoScroll

  ```
  <xsl:attribute name="href">#NoScroll </xsl:attribute>
  ```

  `NoScroll` is sent to the `href` portion of a link when there is nothing to put there (for example, when the link is supposed to run JavaScript).

  `NoScroll` prevents the page from refreshing, going to another page, or scrolling when it should not.

- event

  ```
  <xsl:attribute name="onkeydown">returnekFlexMenu.menuBtnKeyHdlr
  (event);</xsl:attribute>
  ```

  To make the xslt cross-browser compatible, it must support different methods of obtaining/passing the event object. In this example, the global event object is passed to the handling function.

  NOTE: `event` corresponds to `window.event`. `window;` is implied.

How FlexMenu determines which item is selected

The FlexMenu server control can select (highlight) options in a FlexMenu as site visitors navigate around the website. For example, a site visitor arrives at a Web page through a link in an email. If the QueryString matches the an item in a FlexMenu, the item is shown as selected.

Below is the logic the FlexMenu uses to decide when a menu item should show as selected. The list is presented in the order in which the code checks to see if an item should be highlighted.

If any menu item is selected, its parent menu is marked selected. If any menu is selected, all ancestor menus are selected. When all tests have been performed and no matches are found, the FlexMenu is rendered with no items selected.

NOTE: As soon as one condition is satisfied, the item is shown as selected and the testing stops.

NOTE: Steps 2 through 8 are each repeated recursively throughout the menu data hierarchy until either a match is found or the end is reached. If there are no matches for a test, the control continues with the next one.

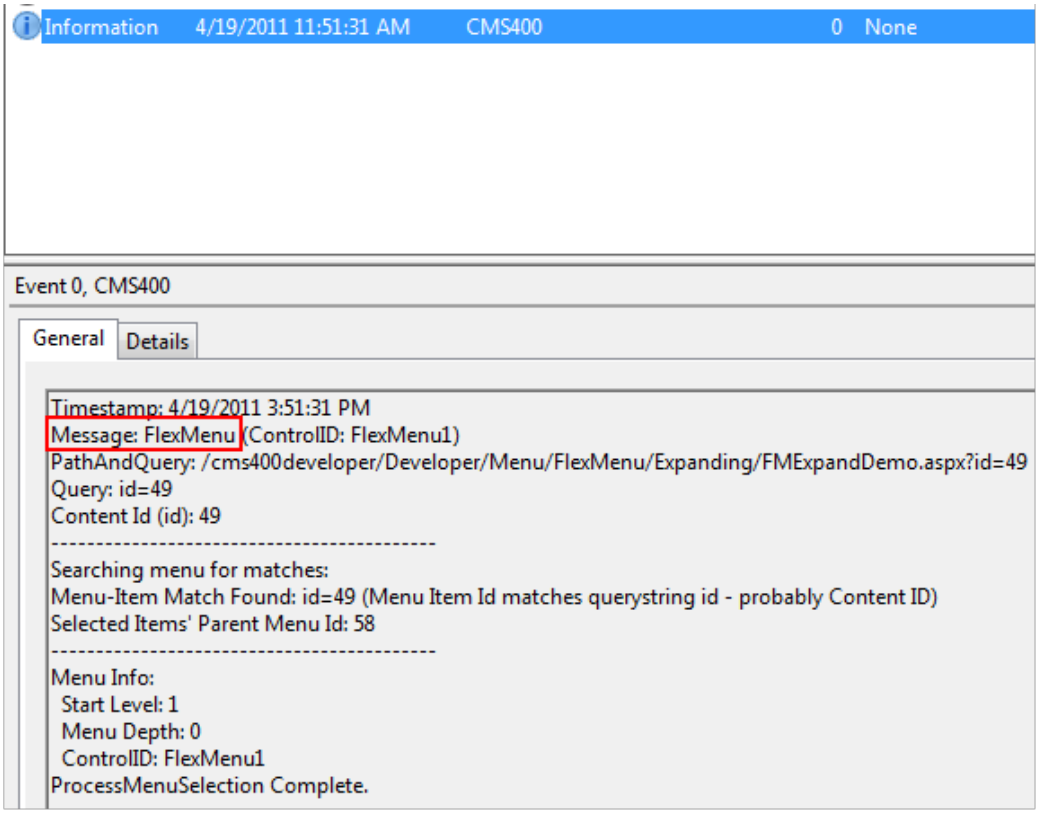
1. Inspects the QueryString to see if the `ekxmensel` parameter is present with a matching menu node ID. This parameter is used to specify the exact node a user clicked. The node, its parent, and ancestor menus are all marked as selected.
2. Inspects the QueryString to see if a Content ID parameter value matches a menu item. If the Content ID in the QueryString matches a menu item, it is

highlighted. For example, the QueryString includes `ExamplePage.aspx?id=123`, and a menu item links to Content ID 123.

3. Inspects the QueryString to see if a Form ID parameter value matches a menu item. If the Form ID passed in the QueryString matches a FlexMenu item, it is highlighted. For example, the QueryString includes `ExamplePage.aspx?ekfrm=456`, and a menu item links to Form ID of 456.
4. Inspects the QueryString for a direct match with a menu item link. If there is a match, the menu item is selected. For example, if the QueryString has `ExamplePage.aspx` and there is an item on the menu that matches, the menu item is shown as selected.
5. Inspects the QueryString for a `id`, `ekfrm` or `pageid` parameter. If one is found, the control looks for a folder association between submenus and the folder that contains the object with the given ID. If the association exists, the menu item is shown as selected.
6. Inspects the QueryString to see if there is a direct match with a menu button link. If there is a match, the menu button is selected. For example, the QueryString has `ExamplePage.aspx` and there is a button on the menu that matches.
7. Inspects the QueryString to see if there's a template association with the filename. If there's a match, the menu item is shown as selected.
8. Inspects the QueryString for the `id` or `ekfrm` parameter and whether a value greater than zero is associated with it. If so, the control checks menu buttons for use of `LinkIt.aspx`. If a button is using `LinkIt.aspx` and either `id` or `ekfrm` parameter matches, the menu button is selected.

Analyzing FlexMenu's selection of menu items

The FlexMenu server control performs a complex sequence of tasks to determine which menu option to select. If you are unsure of a FlexMenu's behavior, you can view a log that lists the reasons for a menu selection. Use the log to troubleshoot issues with a FlexMenu.



Setting up log of FlexMenu information

Follow these steps to set up the ability to view a log of FlexMenu display information.

1. Open your *site root*`/web.config` file.
2. Under `system.diagnostics`, set `LogLevel` to **4**. Save and close web.config.

```
<system.diagnostics>
  <switches>
    <!-- Determines the level of messages that are logged
      1 = Error:  Only Errors are logged.
      2 = Warning:  Only warnings and Errors are logged.
      3 = Information:  Only Informationals, Warnings, and Er
      4 = Verbose:  Everything is logged.

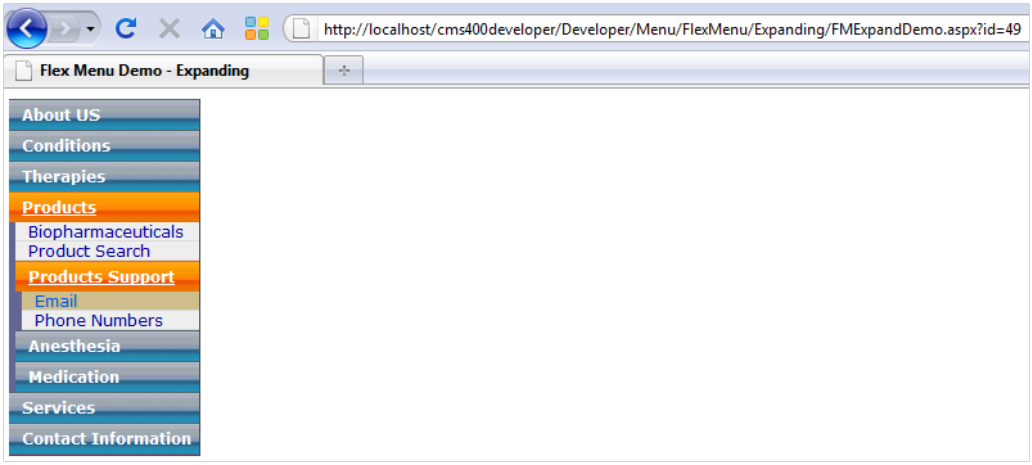
      NOTE: you can configure where each message level is log
    -->
    <add name="LogLevel" value="4" />
  </switches>
</system.diagnostics>
<ektronCommerce>
  <add key="ek_ecom_ComplianceMode" value="false" />
  <!-- This is used only when compliance mode is on, and canno
  <add key="ek_ecom_PasswordHistory" value="4" />
```

3. Edit the .aspx or .ascx page that hosts the FlexMenu control.
4. Set the control's `LogInfo` property to **true** and save the page.

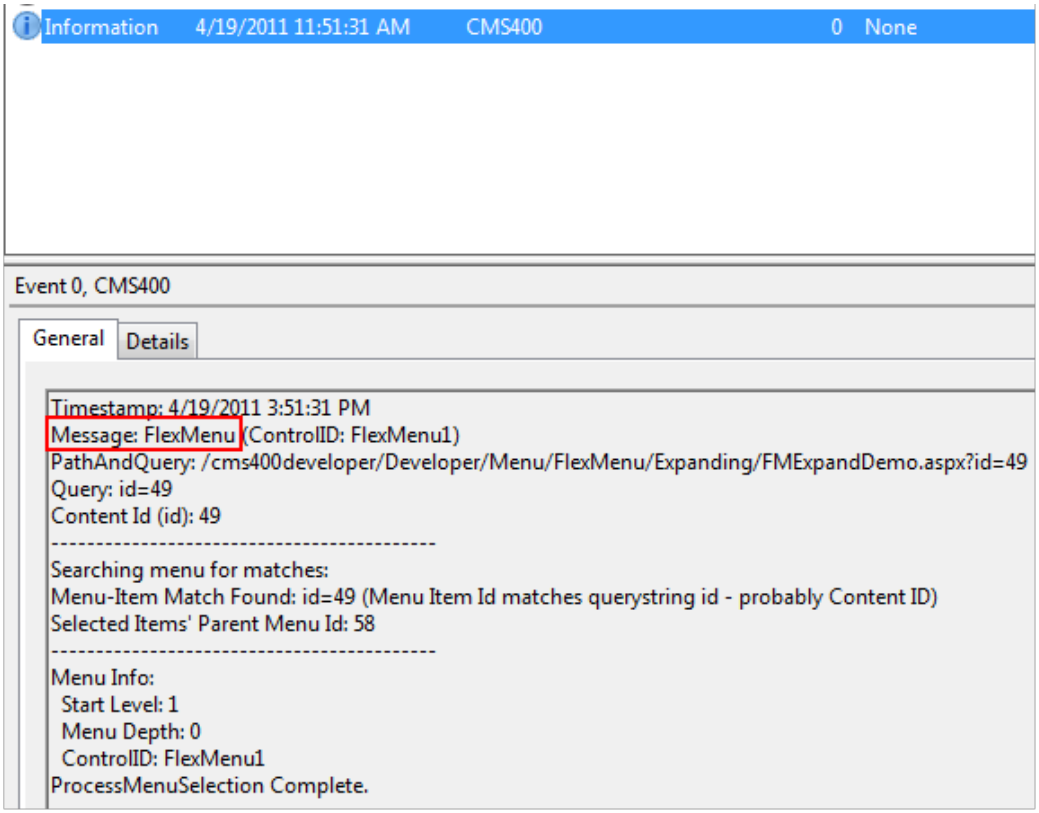
```
<CMS:FlexMenu ID="FlexMenu1" LogInfo="True" runat="server" />
```

NOTE: It may be helpful to temporarily disable the menu's cache by setting `CacheInterval="0"`.

5. Refresh the browser that contains the FlexMenu you edited in the Step 4.



6. Using the Windows Event Viewer, look for the newest information-level event that contains **Message: FlexMenu** (under the timestamp line).

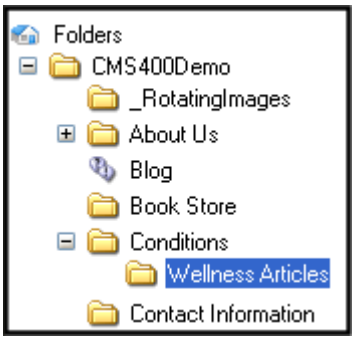


The event message identifies the reason the menu node was selected. Or, if no matches were found, the message indicates that nothing is selected.

FolderBreadcrumb

8.50 and higher

The FolderBreadcrumb server control displays Sitemap breadcrumbs. This trail typically consists of the current content's folder path. For example, the FolderBreadcrumb below matches the content's folder structure.



The FolderBreadcrumb server control does not read your folder structure and display its path. Instead, administrators define a folder's breadcrumb trail on the Folder properties > **Breadcrumb** tab.

Inserting the FolderBreadcrumb server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

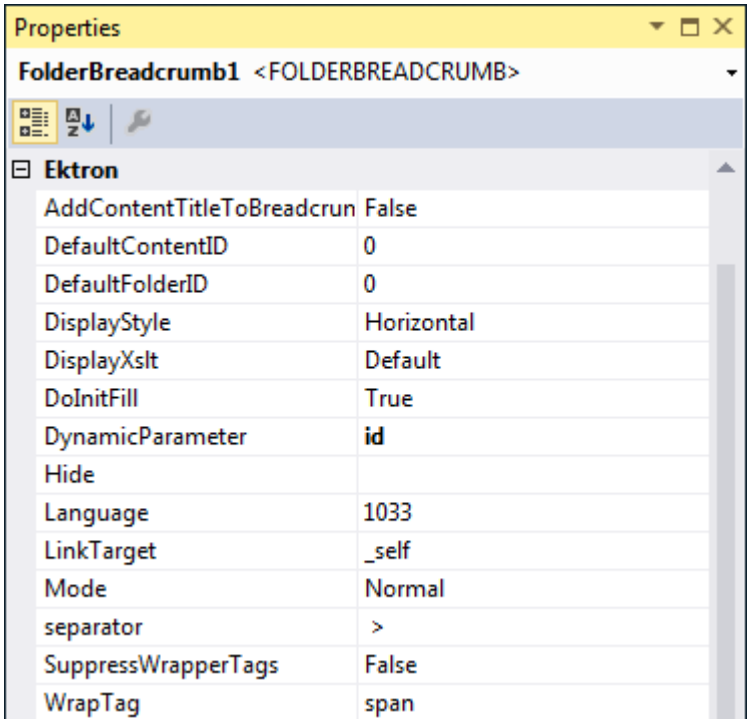
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **FolderBreadcrumb** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:FolderBreadcrumb ID="FolderBreadcrumb1" runat="server" />
   ```

4. Click on `FolderBreadcrumb` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as

you modify the property values.



FolderBreadCrumb properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddContentTitleToBreadcrumb** (Boolean)

  When set to **true**, the content title is added to the end of the breadcrumb path, as shown.

  Home > Content > Content_Title

  By default, the value is set to **false**. In that case, the breadcrumb path looks like this.

  Home > Content

- **DefaultContentID** (Long)

  Display the breadcrumb trail for the folder in which the given content ID resides. To use this property, breadcrumb information for a folder must be defined in the Workarea > [Specified Folder] > Folder properties > Breadcrumb tab.

- **DefaultFolderID** (Long)

  The folder ID for which you want the breadcrumb trail to display. If a DefaultContentID is given, it overrides this property. To use this property, breadcrumb information for a folder must be defined in the Workarea > [Specified Folder] > Folder properties > Breadcrumb tab.

- **DisplayStyle** (DisplayStyles)

  Indicate how to display the breadcrumb trail: horizontally or vertically. The default is Horizontal.

- **DisplayXslt** (String)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page. If nothing is specified, the menu is output as raw XML. FlexMenus use an .xsl file to control the menu's behavior, and a .css file to control its display. Ektron provides several sample menus, and each has an xslt file. If this is a new menu, you may find it easier to copy and edit an xslt file provided with a sample menu. See also: *SampleMenu* on page 2496.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID dynamically.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **Mode** (Modes)

  Lets you make the breadcrumb trail appear as non-hyperlinked plain text.

  - **Normal** (normal). Breadcrumb trail is hyperlinked
  - **DisplayOnly**. Breadcrumb trail is plain text

- **Separator** (String)
  Enter one or more characters to separate the items in a breadcrumb trail on this Web form. The default character is the greater than sign (**>**).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Using a FolderBreadcrumb server control

Add the FolderBreadcrumb server control to each Web form for which you want to create a breadcrumb site map.

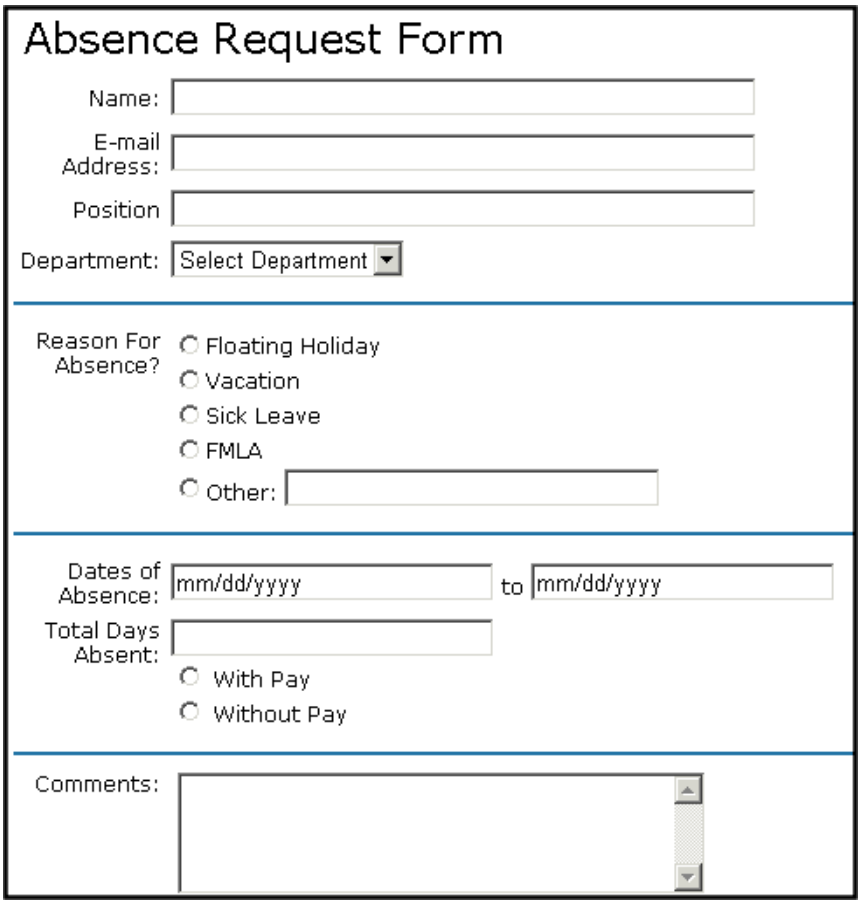
Follow these steps to use a FolderBreadcrumb server control.

1. In the Workarea, define breadcrumb information for a folder. See also: *BreadCrumb* on page 2196
2. Open a Web form for which you want to create a site map.
3. Drag and drop the FolderBreadcrumb server control onto the Web form.
4. Set the `DefaultContentID` or `DefaultFolderID` property. If you use `DefaultContentID`, make sure the content is in a folder for which breadcrumb information is defined. If you use `DefaultFolderID`, make sure breadcrumb information is defined for that folder.
5. Save the Web form.
6. Open a browser.
7. View a Web page that hosts the control to view the breadcrumb trail.

FormBlock

8.50 and higher

The FormBlock server control displays a content block associated with a form. When added to a template and visited, the form content block might look like the following example. You can change the display to suit your needs by modifying its properties. See also: Working with HTML Forms.



IMPORTANT: If you create a template for an existing form content block, you must manually change its quicklink to point to the new template. This change does not occur automatically. This procedure is described in Adding a Quicklink to Content.

Inserting the FormBlock server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

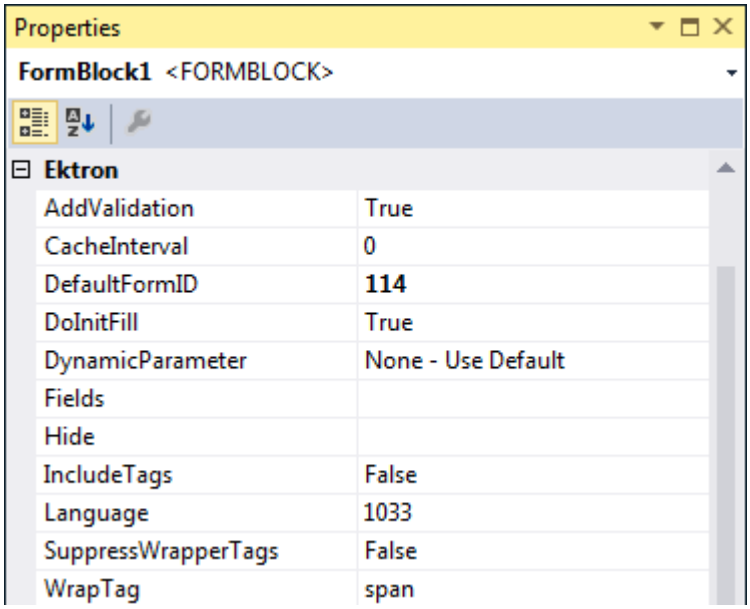
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.

3. Drag the **FormBlock** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:FormBlock ID="FormBlock1" runat="server" />
   ```

4. Click on `FormBlock` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



FormBlock properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddValidation** (Boolean)

  The AddValidation property is obsolete and ignored. It has no effect. It is always true.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultFormID** (Long)

  The ID of a FormBlock that appears where you inserted this server control if no other form block is identified. If you don't know the ID number of the form block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  To make this form block dynamic, select **id**. When you do, this server control uses the form block passed as a URL parameter.
- **Fields** (FormFieldCollection)
  Displays a list of fields that are defined in the form. These fields are read only. This is an excellent way of displaying the field names used on the form. With this list of names, you can create events using the fields without having to enter the Workarea to see the names.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IncludeTags** (Boolean)
  Determines if tags are generated automatically of manually.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Forum

8.50 and higher

After creating at least one hierarchy of discussion board elements, place a Forum server control on a Web page. The Forum server control displays a discussion board on a Web page. You should add text below the Login server control to remind the site

visitor to enter an email address at the **User** field. For example, "At the **User** field, enter your email address." See also: Working with Discussion Boards.

CMS300 Discussions about CMS300	3	5	Friday, August 25, 2006 8:25 AM by sk

If you want to require site visitors to authenticate, the Web page that hosts the forum should contain

- a Membership server control (or a link to page that has one). This lets site visitors/membership users register for discussion boards.
- a Login server control that lets the site visitor/membership user log in

IMPORTANT: After placing a Forum server control on a page, follow the procedure described in *Updating the page Command* on page 2443. Otherwise, the user may get an error when posting a reply.

Inserting the Forum server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

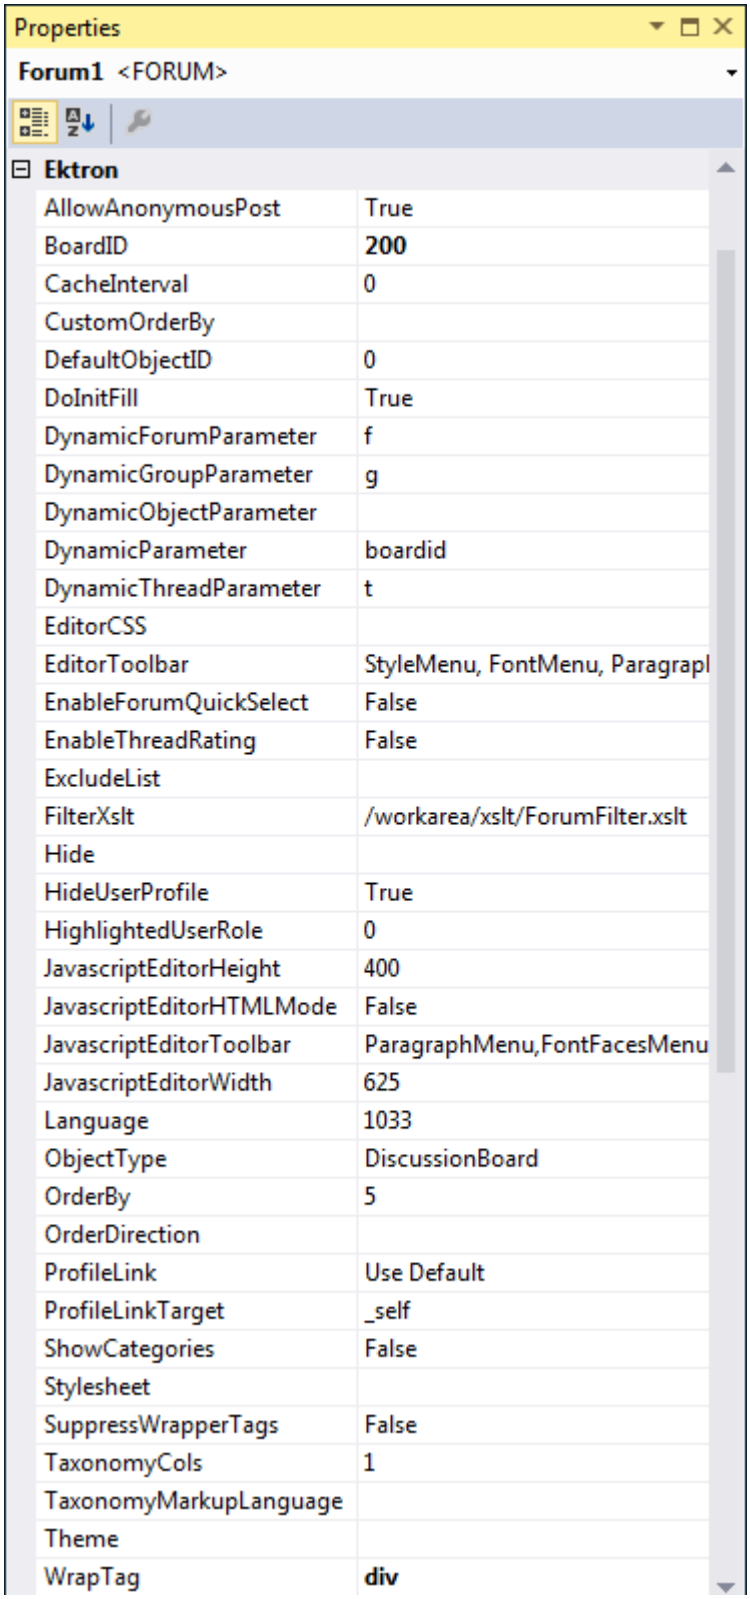
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Forum** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Forum ID="Forum1" runat="server" />
   ```

4. Click on `Forum` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Forum properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AllowAnonymousPost** (Boolean)

  Set to True to allow site visitors the option of posting anonymously to the forum. When true, a **Post Anonymous** checkbox appears above the text editor used to create a post.

  If a site visitor adds a check mark to this box, the word Anonymous appears where the Display Name normally appears. The default is **True**.

  - **True**. Display **Post Anonymous** checkbox when site visitors create a post.
  - **False**. Disable **Post Anonymous** checkbox.

- **BoardID** (Long)

  The ID of the discussion board to display on this page if one is not defined in a query string parameter. If you don't know the ID, click **Ellipses** (), then sign in and select a discussion board.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **CustomOrderBy** (String)

  Provide a property's Friendly Name to order search results by that property. For example, if you define DocAuthor, results will be sorted by the document's author. Results can be ascending or descending based on `OrderDirection`. If you enter an invalid property, no search results are returned. If you specify both `CustomOrderBy` and `OrderBy`, the `OrderBy` property is ignored.

- **DefaultObjectID** (Long)

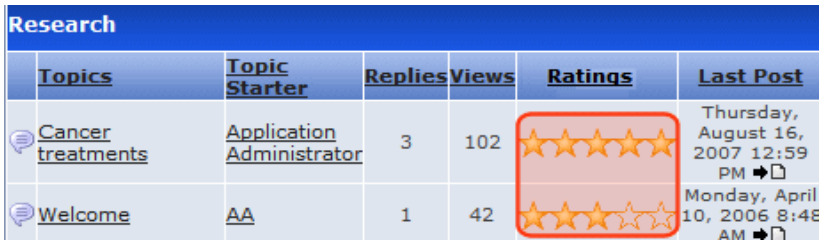
  The Static ID of a community group.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during

the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicForumParameter** (String)
  Gets or sets the QueryString parameter to read a forum ID dynamically. The default is "**f**". Note that a Forum resides one level below a discussion board.
- **DynamicGroupParameter** (String)
  Gets or sets the QueryString parameter to read a group's ID dynamically. The default is "**g**".
- **DynamicObjectParameter** (String)
  Dynamic Parameter for the community group id. Default is "**id**".
- **DynamicParameter** (String)
  Gets or sets the QueryString parameter to read a discussion board's ID dynamically. Set to **None - Use Default**. If you want to always display the default discussion board. Note that a discussion board is one level above a Forum.
  - **boardid**. Reads a Threaded discussion board's ID dynamically.
  - **None - Use Default**. Use the default discussion board's ID.
  - **ID**. Reads a discussion board's ID dynamically.
- **DynamicThreadParameter** (String)
  Gets or sets the QueryString parameter to read an individual thread's ID dynamically. The default is "**t**". Note that a Thread resides 2 levels below a discussion board and one level below a Forum.
- **EditorCSS** (String)
  Set the style sheet for the Editor when a site visitor creates or edits a post. By default, this property is blank. When a style sheet is not supplied, the style sheet defined in the Theme property is used.
- **EditorToolbar** (String)
  Enter a comma separated list of items that you want to appear on the Editor's toolbar. The default is **StyleMenu, FontMenu, ParagraphMenu, TextFormatMenu, LinkMenu, ClipBoardMenu, SymbolsMenu, EmoticonSelect, WMV, Table**. See also: *Adding and removing toolbar items from the editor* on page 2444.
- **EnableForumQuickSelect** (Boolean)
  If you set this property to `true`, a drop-down list of all forums appears below the topic list. The site visitor can click a forum and jump immediately to it.
- **EnableThreadRating** (Boolean)
  If you set this property to `true`, a ContentReview server control appears on any topic screen run by this server control. The site visitor can use the control to rate the topic thread. An average rating for the thread appears next to each topic on the forum screen.



- **ExcludeList** (String)

  Enter a comma-separated list of custom user properties to exclude from the Forum's profile page. For example, to suppress the **Subscriptions** field value, enter **subscriptions**.

- **FilterXslt** (String)

  Enter the path to an XSLT file used to filter forum content, such as, HTML Attributes, Tags and unwanted words in a user's forum post. The path can be relative or absolute. The user's post is filtered when the user clicks **Submit**.

  By default, this property points to `<webroot>/siteroot/Workarea/Xslt/ForumFilter.xslt`. This file removes hrefs with javascript:, vbscript: and "on" events in the link. You can modify this file or create a new one.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **HideUserProfile** (Boolean)
  - **True**. Hide user profiles from non-administrator users.
  - **False**. Display user profiles for non-administrator users.

  The default is **True**. An administrator can view a profile regardless of how this property is set.

  On the other hand, if the **Private Profile** is set to Private for any user, the profile information is not visible, regardless of this setting. If Private Profile is set to Colleagues, only colleagues can see profile information. When the profile is visible, only properties and their values not listed in the `ExcludeList` property (above) appear.

- **JavascriptEditorHeight** (Integer)

  Set the height in pixels for the eWebEdit400 editor. The default is **400**. The minimum height is 300.

- **JavascriptEditorWidth** (Integer)
  Set the width in pixels for the eWebEdit400 editor. The default is **625**. The minimum width is 500.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

  Set property to **-1** if you want the Forum server control to display topics from all available languages.
- **ObjectType** (String)
  Describes the type of forum displayed by this server control.
  - **CommunityGroup**. Used for forums inside a Community page.
  - **DiscussionBoard**. Used for forums on templates that are not Community pages.
- **OrderBy** (String)
  The order of search results. For example, you want to sort search results by last modified date.
  - **Title**. Content title (alphabetical).
  - **ID**. Content ID number.
  - **Date Created**. Date the content was created.
  - **Date Modified**. Date the content was most recently modified.
  - **Editor.** User who last edited the content (alphabetical).
  - **Rank**. Rank assigned to the content.

  NOTE: The **OrderDirection** field determines the *direction* of the search results. For example, if you sort by ID and **OrderDirection** is set to **Descending**, the results sort by ContentID number with the highest number at the top of the list.

  IMPORTANT: Specifying a `CustomOrderBy` property overrides this property.
- **OrderDirection** (String)
  The direction in which search results are sorted. The default is **Ascending**.
  - **Ascending**. Alphabetical results from A to Z; numeric values low to high; dates from oldest to most recent
  - **Descending**. Alphabetical results from Z to A; numeric values high to low; dates from most recent to oldest
- **ProfileLink** (ItemLinkTargets)
  Enter a link to the user's social networking profile page, a part of Ektron's community platform. This allows a user to click another user's name link or avatar and be taken to the user's profile page. The link has 2 variables that represent the user's ID and display name.
  - **{0}**. User ID
  - **{1}**. User display name

You need to have both variables in the link. The Web form can be relative or absolute. For example:

```
userprofilepage.aspx?uid={0}&dn={1}
```

The default for this property is `?g=profileu={0}`.

When the default for this property is used, users are forwarded to a user's profile page that is included with the forum control.

- **ProfileLinkTarget**

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **ShowCategories** (Boolean)

  If set to **True**, when this server control appears, the user see a **Filter by Category** option. This option helps a site visitor zero in on relevant content. If **False**, the **Filter by Category** option does not appear.
- **Stylesheet** (String)

  Enter the style sheet that will determine the appearance of the menus. FlexMenus use an .xsl file to control their behavior, and a .css file to control their display. Ektron provides several sample menus, and each has a .css file. If this is a new menu, you may find it easier to copy and edit a .css file provided with a sample menu. See also: *SampleMenu* on page 2496.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.
- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TaxonomyCols** (String)

  Use this property to determine the number of columns on the Taxonomy screen available from this discussion board. In the illustration below, taxonomy categories are arranged in 3 columns (the default value).

- **TaxonomyMarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633
- **Theme** (String)
  Enter the custom theme's folder name. The theme can be relative to the site root or located in the current folder. For example:
  - Relative. `Theme="/workarea/csslib/themes/winter"`
  - Current Folder. `Theme="mytheme"`

  If you do not specify a theme, the property uses the location defined by the discussion board's CSS theme property in the Workarea. See also: *Using a custom theme* on the next page
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Updating the page Command

To prevent an error from appearing when a user posts a reply to the Web page that hosts the Forum server control:

1. Open the Web form onto which you inserted the Forum server control.
2. Access Source view.
3. Go to the top line of the Web form, which begins with `@ Page`.

```
<%@ PageLanguage="VB"AutoEventWireup="false"
CodeFile="Default2.aspx.vb"Inherits="Default2" %>
```

4. Near the end of the line, enter `validaterequest=false`.
5. Build the page.

Using a custom theme

This property lets you specify a custom location for your themes. By doing so, you prevent them from being overwritten when you upgrade.

If you do not specify a theme in the server control, Ektron uses what is defined in the discussion board's properties **CSS Theme** field.

To create a custom theme:

1. Create a new subfolder on your site. In this example, we use a winter theme:

```
<web root>/<your site>/Workarea/csslib/winter.
```

2. Copy all files in the `/Workarea/Threadeddisc/themes` folder to the `winter` folder.
3. Change the image files to match your theme. To find the name of an image:
   a. Right click on it while viewing it in a browser.
   b. Select Properties. The name appears at the top of the dialog box.
4. Change the discussion board's .css file to match your theme and save it with a custom name. (You do not need to do this if an existing .css file meets your theme's needs.)

   IMPORTANT: Make sure the **CSS theme** property in the Workarea is pointing to the proper CSS file.

5. View the discussion board in a browser to see the changes.

Adding and removing toolbar items from the editor

IMPORTANT: You cannot create new buttons and add them to the Forum Editor. You can only add and remove existing buttons.

IMPORTANT: This section is only applicable if you are using the eWebEdit400 editor.

You can add and remove toolbar items on the Forum Editor by editing the EditorToolbar property. This property contains a series of string values that represent each item, listed below.

- **StyleMenu**. Display a list of paragraph styles. Users can select from the list to apply a style to selected text.
- **FontMenu**. Display a list of available font styles, sizes and colors.

- **ParagraphMenu**. Controls the display of buttons that affect a paragraph. This includes:
  - Numbered List
  - Bullet List
  - Outdent
  - Indent
  - Align Left
  - Align Center
  - Align Right
  - Justify
  - Horizontal Rule
- **TextFormatMenu**. Controls the display of buttons that format text. This includes:
  - Bold
  - Italics
  - Underline
- **LinkMenu**. Controls the display of buttons that allow a user to add and remove hyperlinks links and work with the library. This includes:
  - Hyperlink Manager
  - Remove Link
  - Library
- **ClipBoardMenu**. Controls clipboard buttons that allow a user to cut, copy, and paste content. This item also controls the Undo and Redo buttons.
- **SymbolsMenu**. Controls the display of the Symbol button, which allows users to insert symbols and special characters.
- **EmoticonSelect**. Controls the display of the Emoticon button.
- **WMV**. Controls the display of the Insert WMV button.
- **Table**. Controls the display of the Insert table button.

ImageControl

8.50 and higher

The ImageControl server control, when viewed on a Web form, displays an image stored within the Ektron Document Management feature. If you log in and have permission to edit the image, you can right click the image and select **Edit**. This action displays a dialog box with which the user can update the image.

IMPORTANT: Images are stored as assets using the Document Management feature. This control does not use the Ektron Library.

Inserting the ImageControl server control onto a page

PREREQUISITE

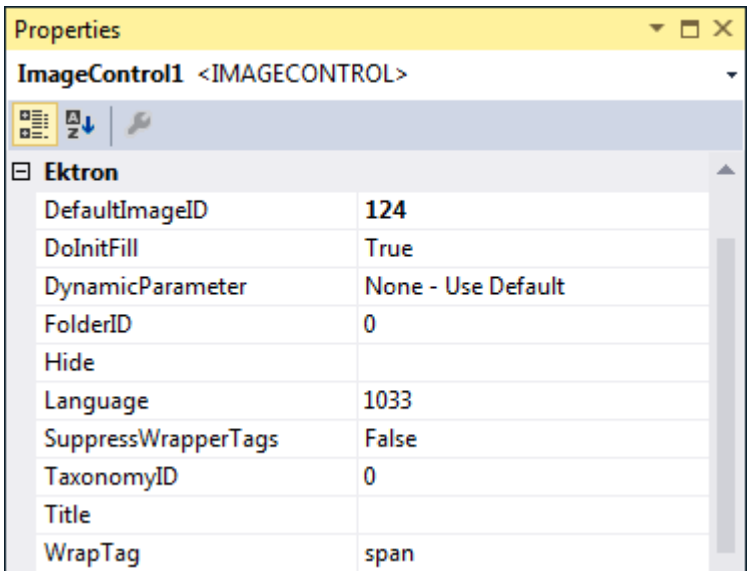
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ImageControl** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:ImageControl ID="ImageControl1" runat="server" />
   ```

4. Click on `ImageControl` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ImageControl properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DefaultImageID** (Long)

  The image asset's content ID you want to display. If you don't know the ID number of the asset, use the CMS Explorer to browse to it.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)
  Gets or sets the QueryString parameter to read an image asset's ID dynamically. To have the default image ID used, leave blank.
- **FolderID** (Long)
  The ID of the folder where images are added. If you don't know the ID number of the folder, use the CMS Explorer to browse to it.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TaxonomyID** (long)
  The ID of the taxonomy to which assets are added.
- **Title** (String)
  Set the image's alt/title text. By default, the image file name is used.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Language server controls

8.50 and higher

The Language server controls are as follows:

- *LanguageAPI* below
- *LanguageSelect* on page 2450

LanguageAPI

8.50 and higher

The LanguageAPI server control lets a developer force a particular language for a website. You can do this by dropping the server control on the page and setting a language in the `SiteLanguage` property box. You can also override site language logic by programmatically using the LanguageAPI server control to detect the browser's language, and display the site in that language.

Inserting the LanguageAPI server control onto a page

PREREQUISITE

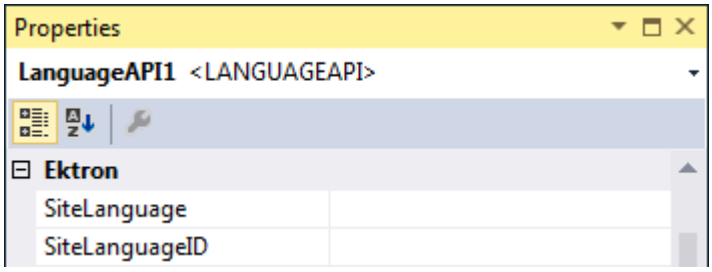
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **LanguageAPI** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:LanguageAPI ID="LanguageAPI1" runat="server" />
   ```

4. Click on `LanguageAPI` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



LanguageAPI properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **SiteLanguage** (String)

  Sets the site language. Runs through the IsValid function to verify that the language is an active language in the system.

- **SiteLanguageID** (Integer)

  Numeric value of the site language. This is the property you will use if you are using code-behind to set the sites language ID.

  Example: 1036 = French

For a list of supported languages, go to **Workarea > Settings > Configuration > Language Settings**.

LanguageAPI code-behind Only properties and Methods

The following is a list can only be used programmatically.

- **CurrentLanguage** (String)
  Read only. Returns the current language.
- **CurrentLanguageID** (Integer)
  Read only. Returns the current language ID.
- **DefaultLanguage** (String)
  Read only. What the default language of the site is set to. For example, the demo site is "English (Standard)".
- **DefaultLanguageID** (Integer)
  Read only. Returns the value that is the default language ID of the site. For example, the demo site is "1033" for English.
- **GetLanguage** (Integer Argument)
  This method returns a string. Pass in a valid language ID and it will return the language name.
- **GetLanguageID** (Sting Argument)
  This method returns an integer. Pass in a valid language name and it will return the language ID.
- **IsValid** (Argument)
  This method returns a boolean. You can pass in a language ID or a string and it will tell you if the system is supporting it.
- **LanguageIdList** (Array of Integers)
  Read only. Lists all the language IDs that are activated in Ektron. For information on how to enable languages, see Determining Which Languages are Available.
- **LanguageTitleList** (Array of Strings)
  Read only. Lists all the languages that are activated in Ektron.
- **MultiLanguageEnabled** (Boolean)
  Read only. Tells if the site supports multi-language mode.
  - **True** (default). Multi-language enabled
  - **False**. Multi-language not enabled

Using LanguageAPI programmatically

This example uses a logo that is not managed through Ektron. It retrieves the current language from the LanguageAPI control, and uses that information to choose the logo version to display. The code-behind looks like this.

```
Select Case LanguageAPI1.CurrentLanguageID
       Case 1031
       Image1.ImageUrl = "germanlogo.png"
       Case 1033
       Image1.ImageUrl = "englishlogo.png"
       Case 1036
       Image1.ImageUrl = "frenchlogo.png"
End Select
```

LanguageSelect

8.50 and higher

The LanguageSelect server control displays a language selection drop-down list on an Ektron Web page. The control lets a site visitor select a language in which to view the site. Here is what the control looks like when published on a Web page.

It lists all languages selected on the **Settings > Configuration > Language settings** screen. (For more information, see Determining Which Languages are Available.)

You can place this control in any location of any page on your site.

Inserting the LanguageSelect server control onto a page

PREREQUISITE

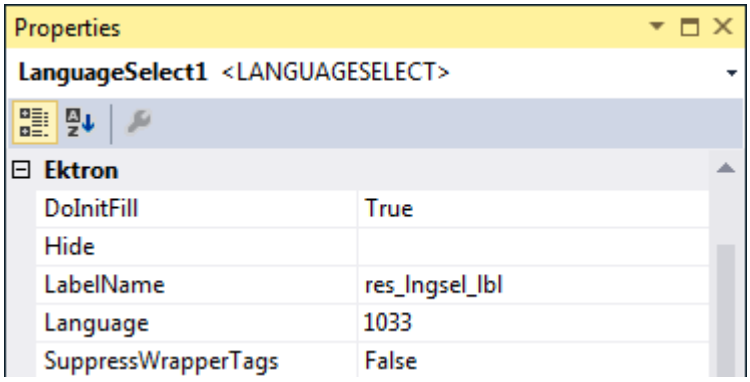
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **LanguageSelect** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:LanguageSelect ID="LanguageSelect1" runat="server" />
```

4. Click on `LanguageSelect` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



LanguageSelect properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

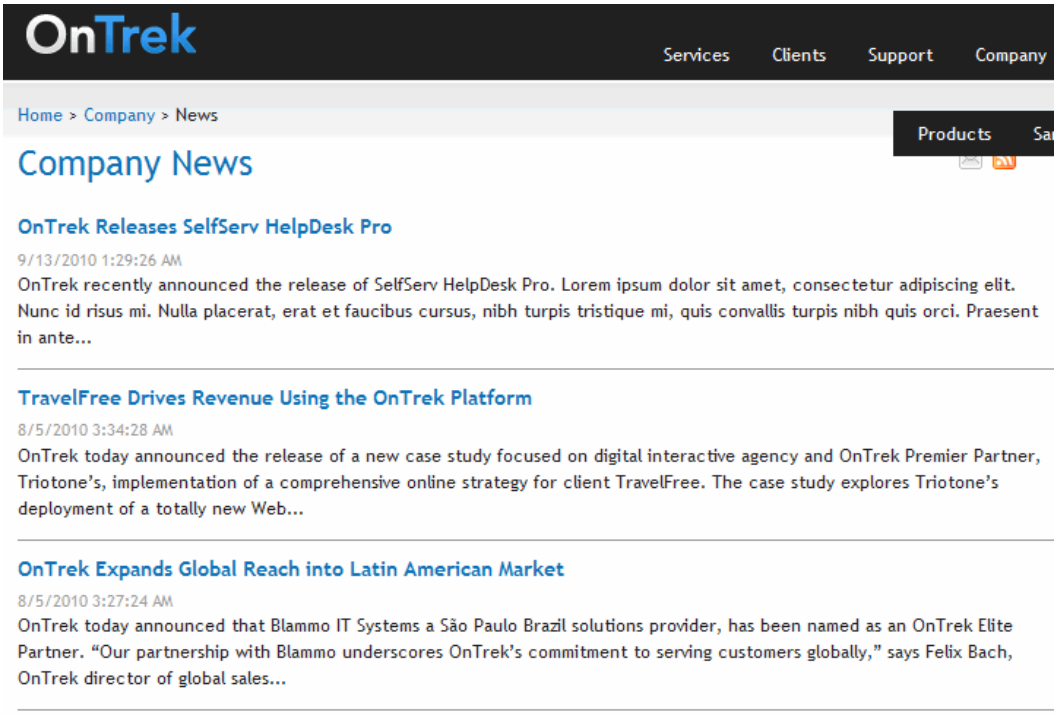
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **LabelName** (String)
  Lets you define the label next to the language select drop-down box.
- **Language** (Integer)
  Set a language for the Language Select Box. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

ListSummary

8.50 and higher

IMPORTANT: Starting from release 8.60, the ListSummary server control was replaced by the FrameworkUI: <ektron:ContentView> templated server control. If you are already using the ListSummary server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The ListSummary server control displays a list of content in a selected folder on a Web page. Optionally, the display can include content in all subfolders of the selected folder. When added to a template and visited, a ListSummary looks like this.



It displays each content block's title and summary information. You can modify the display to suit your needs by modifying its properties.

NOTE: To display a List Summary on a PageBuilder page, use the ListSummary widget.

This section also contains the following topics.

NOTE: In contrast to a List Summary, a ContentList server control displays selected content items from any Ektron folder. See also: *ContentList* on page 2336

Inserting the ListSummary server control onto a page

PREREQUISITE

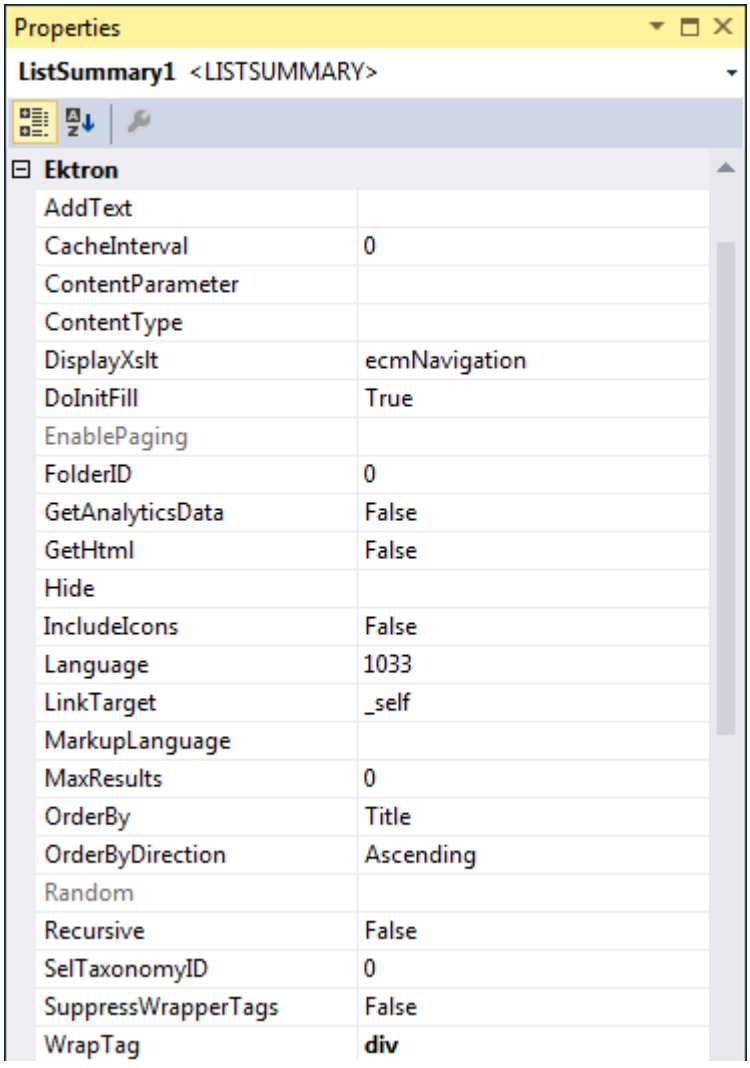
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **ListSummary** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:ListSummary ID="ListSummary1" runat="server" />
```

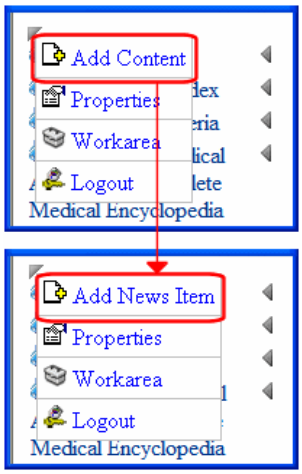
4. Click on `ListSummary` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



ListSummary properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddText** (String)
  Override the control's default text for the Add Content menu item.
  For example, you have a News website. You could change **Add Content** to **Add News Item**.



- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

  NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **ContentParameter** (String)
  Checks the QueryString for this value and replaces the list summary with a content block when specified. Leave blank to always display the list summary.

- **ContentType** (String)
  Determines the type of content that appears in the list summary. The default is Content. Choices are:

  - **AllTypes**. All content types for the given folder
  - **Content**. A list of content items.
  - **Forms**. Forms appear in the list summary
  - **Archive_Content**. Archived content blocks appear in the list summary
  - **Archive_Forms**. Archived forms appear in the list summary
  - **Assets**. Assets, such as offices documents, appear in the list summary
  - **Archive_Assets**. Archived assets appear in the list summary
  - **LibraryItem**. Library items appear in the list summary
  - **Multimedia**. Multimedia items appear in the list summary
  - **Archive_Media**. Archived multimedia items appear in the list summary
  - **NonLibraryContent**. All content types except library items.
  - **DiscussionTopic**. Forum topics appear in the list summary.

- **CatalogEntry**. Displays all catalog entries (products) for a specified catalog.

- **DisplayXslt** (String)
  Determines how information on the page appears
  - **None**. Databind only
  - **ecmNavigation**. Lists the title of every content block in the folder.
  - **ecmTeaser**. Lists the title of every content block in the folder plus the content summary.
  - **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **EnablePaging** (Boolean)
  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen.

  See example below.

  So, for example, if a List Summary has 9 items and the `MaxResults` property is set to 3, the screen displays only the first 3 items. When the site visitor clicks **[Next]**, he sees items 4, 5 and 6, and so on.
  - **True**. Use paging feature
  - **False**. Ignore paging feature

NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **FolderID** (Long)

  The folder that contains the items which appear in the list summary. See also: *Browsing your Ektron site using CMS Explorer* on page 2147. The `Recursive` property determines whether content blocks in this folder's child folders also appear.

- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. Analyzing Websites.

- **GetHtml** (Boolean)

  Set to **True** to display the HTML body for all content in the list summary. For example, to display content inside a Web server control such as a GridView.

  - **True**. Get and display HTML for each content block in the list summary
  - **False**. Do not get and display HTML.

- **Hide** (Boolean)

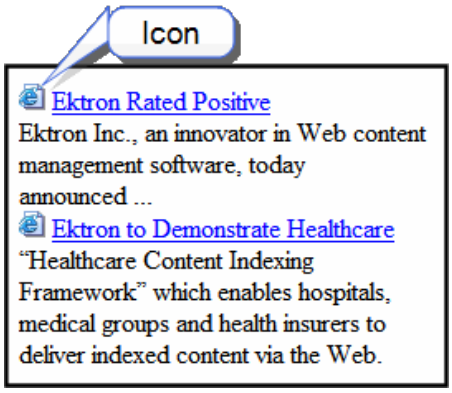
  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **IncludeIcons** (Boolean)

  Choose whether to display icons next to the list summary's links.

  IMPORTANT: This property works only when ecmSummary or ecmTeaser are used in the `DisplayXslt` property. When the `[$ImageIcon]` variable is used in an EkML file and that file is assigned to the `MarkupLanguage` property, this property acts as True. See also: *Ektron Markup Language* on page 2633.



- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **LinkTarget** (String)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633

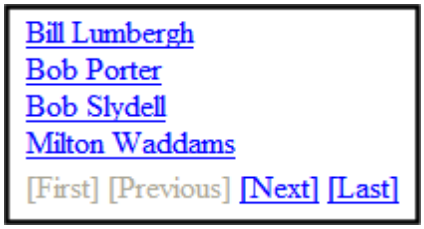
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.

  See also: *listsummary.ekml* on page 2635
- **MaxResults** (Integer)
  Enter the maximum number of items to appear in the initial display of this server control.

  If you enter no value or 0 (zero), the maximum is 50. This is done for performance reasons.

  To let site visitors view more than the maximum but limit the amount of space being occupied, enter the maximum number of results per page here. Then, set the `EnablePaging` property to **True**.

  If you do and more than the number of `MaxResults` are available, navigation aids appear below the last item to help the site visitor view additional items. See example below.



- **OrderBy** (Ektron.Cms.Controls.CmsWebService.TeasersOrderBy)

  NOTE: For releases 8.0.1 and later the **OrderKey** property has been replaced by this **OrderBy** property.

  Sort the list by one of the values.

  - **Title**. Content Title
  - **DateModified**. Date content last modified
  - **DateCreated**. Date content created
  - **LastEditorFname**. First name of user who last edited content
  - **LastEditorLname**. Last name of user who last edited content
  - **Start Date**. Go Live date of content
  - **Rated**. Business Analytics Content Rating
  - **ContentViewCount**. Business Analytics Content Views
- **OrderbyDirection** (Ektron.Cms.Controls.CmsWebService.OrderByDirection)

  How to order the hyperlinks on the list. The sort field is determined by the `OrderKey` property.

  - **ascending**. Hyperlinks are arranged A, B, C or 1,2,3.
  - **descending**. Hyperlinks are arranged Z, Y, X or 3,2,1

  If sorting by date, descending puts the most recent first.
- **Random** (Boolean)

  Set to **True** if you want to randomly display one content block in the specified folder. The content changes each time a user views the page.

  - **True**. Randomly display one content block.
  - **False**. Display the list summary normally.

  If you use a custom XSLT or EkML file, the type of content displayed can be manipulated. For example, if you use an EkML file that has the [$Html] variable in it, the actual content appears instead of a link. See also: *Ektron Markup Language* on page 2633 and *[$Html]* on page 2666
- **Recursive** (Boolean)

  Determines if the display includes content in child folders of the selected folder.

  - **True**. Include content from child folders.
  - **False**. Do not include content from child folders.

- **SelTaxonomyID** (Integer)
  Set the ID of the taxonomy that content will be associated with when a logged in site visitor uses the Silver Access Point's **Add HTML Content** to add content to a list summary server control.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Retrieving the XML structure of a list summary

Retrieving the XML structure of XML content allows for greater control over developing XSLs. The following example shows how to retrieve the XML structure.

1. Open a new Web form.
2. Drag and drop a ListSummary server control onto it.
3. Set the `FolderID` property.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to MultiLine.

   NOTE: You should set the width of the text box to at least 400px.

6. On the code-behind page, add the following line.

```
Textbox1.Text = ListSummary1.XmlDoc.InnerXml
```

7. Build the project.
8. View the Web form in a browser.
9. The ListSummary's XML structure appears in the textbox.

Login

8.50 and higher

The Login server control places a login button on the template when displayed in a browser. The Login server control displays the following buttons on a Web page. See also: Managing Logins and Passwords.

. When user is not logged in, this button appears. Clicking the button opens the login window, where a user can enter a username and password. Upon authentication, the user is logged in to the Ektron website.

. After a user logs in, this button replaces the login button to let the user log out.

. When logged in, this button appears under the logout button, allowing the user to access the Workarea.

. Lets the user preview the entire website as if all checked-in content were published.

. Turns off site preview mode.

. Launches Ektron online help.

Placing a Login button

You can add any number of login buttons to a template. You can insert a login button on each template, or set up a special Web page, called login.aspx, from which users can log into the Ektron site without the public being able to access the page.

Inserting the Login server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

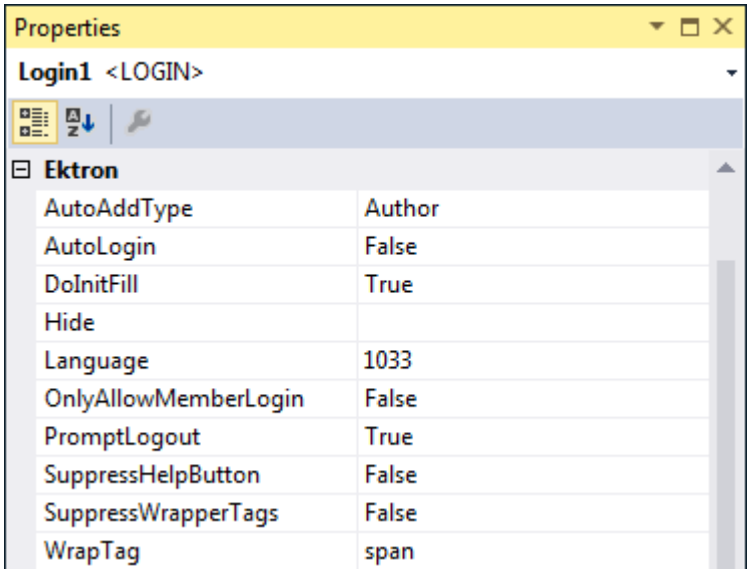
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Login** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Login ID="Login1" runat="server" />
```

4. Click on `Login` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Login properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AutoAddType** (Common.EkEnumeration.AutoAddUserType)

  When using Single Signon, the Login server control can be used to add users to Ektron. In this scenario, when a user signs on with Active Directory credentials, that user is created within the Ektron database. Use this property to define the type of user that is automatically added to Ektron. See also: Single Sign On.

  - **Author.** Ektron user
  - **Member**. Membership user

- **AutoLogin** (Boolean)

  If this property is set to true and Active Directory Integration is enabled, users are automatically logged in using Active Directory authentication. They do not need to enter a username or password. See also: Single Sign On.

  - **True**. Use Active Directory authentication when logging in.
  - **False** (default). Do not use Active Directory authentication when logging in.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

- **True**. Hide the control output.
- **False**. Display the control output.

- **Language** (Integer)

  Set a language for the Login server control. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **OnlyAllowMemberLogin** (Boolean)

  Allows only membership users to log in. This property prevent users from logging as an Ektron user and accessing the Workarea. If an Ektron user tries to log in using this control, this message appears: "Only members are allowed to login here." The default is **False**.

  - **True**. Only membership users can log in
  - **False**. Ektron users and membership users can log in

- **PromptLogout** (Boolean)

  When set to False, the logout process omits the Logout window.

  
  - **True**. Users must click **Logout** to log out.
  - **False**. Logout window does not appear.

- **SuppressHelpButton** (Boolean)

  Hides or displays the Help button. When displayed, the button appears below the Login button.

  - **True**. Do not display the Help button.

  - **False** (default). Display Help button.

    
  If you are editing this server control from a text file and want to suppress the Help button, add the following code to the login tag source:

  ```
  <CMS:Login ID="Login1" runat="server" SuppressHelpButton="True" />
  ```

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

- **True**. Suppress wrap tags.
- **False** (default). Allow wrap tags.

- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Map

8.50 and higher

The Map server control displays a map that flags locations of interest. Each location is an Ektron content item to which map information was added. For example, if your site hosts a school district, each location could represent one school.

Inserting the Map server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

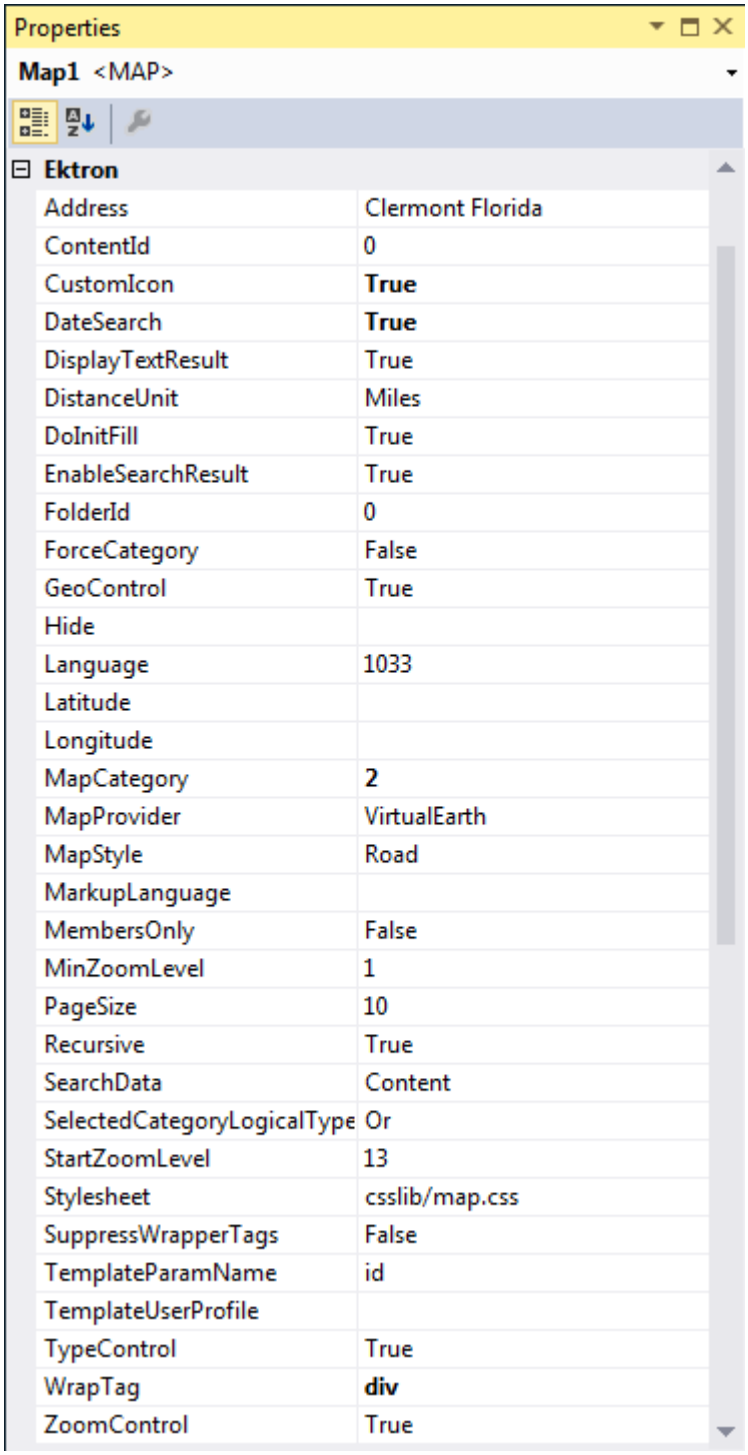
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Map** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Map ID="Map1" runat="server" />
```

4. Click on `Map` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Map properties

Within Visual Studio, you cannot see the map in design mode. However, you can right mouse click the mouse and select **View in Browser** to see the effect of changing the properties.

You cannot place more than one map server control on a form.

Troubleshooting

- If Map does not render on Web page, change the VirtualEarthMap `web.config` element as follows:

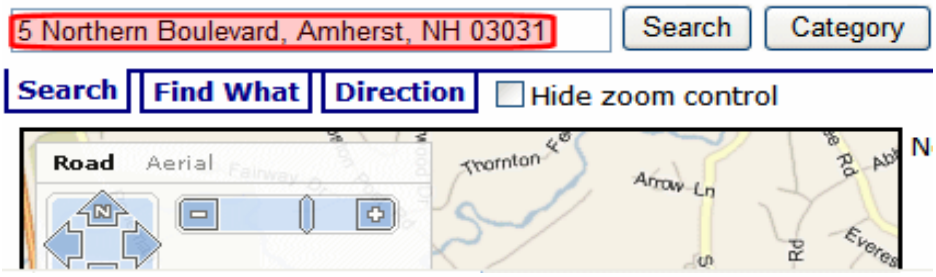
```
<add key="VirtualEarthMap"
  value="https://dev.virtualearth.net/mapcontrol/
  mapcontrol.ashx?v=6.1&amp;s=1" />
```

- If a user must click a warning away before users can see map on page, upgrade Google Maps to a premier subscription. For more information, see Google Maps for Business.

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **Address** (String)

  To set a default map center, enter its address. The address appears in the **Search** field when the map first displays. If you only enter a zip code, the map centers on its post office. If you enter an address, the `latitude` and `longitude` properties are ignored.



- **ContentId** (Long)

  Use this field in conjunction with the **EnableSearchResult** field to limit the map to a single content item. Here, you identify the content item to be mapped. Content *must* have latitude and longitude values to appear on a map.

- **CustomIcon** (Boolean)

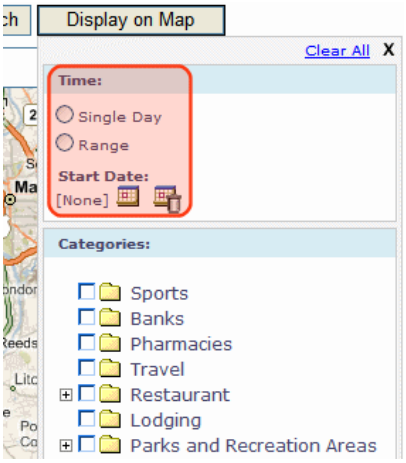
  Use this field if you want the Category popup box to display an icon to the left of each category, as shown below.

  To use this value, open the `webroot/Workarea/images/application/maps/tree` folder. In that folder, create a new folder whose name is the same as the Taxonomy category assigned to the Map server control at the `MapCategory` property. (In the sample

site, this Taxonomy's name is `MapCategory`.) Then, place the icons in that folder by category title name with a .png extension. Use an underscore (_) to separate taxonomy levels. For example, the image for the category Restaurant > American must be named `Restaurant_American.png`.

- **DateSearch** (Boolean)

  Set to **True** to assign a date to content. This feature is helpful for date-related content, such as concerts, meetings, or sporting events. You can filter what appears on the map by date. If you set this property to true, assign a date to date-related content using the **MapDate** standard metadata field. Then, publish the content. When you click a map's **Display on Map** button, the popup screen includes date criteria, as shown below. You can select map items by a single date or a range of dates.



- **DisplayTextResult** (Boolean)

  If you want to display a box of information about each map item to the right of a map, enter **True**. To suppress the text box, enter **False**.

- **DistanceUnit** (Unit)

  Enter the map's units of distance. Choices are miles and kilometers. The default value is miles.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **EnableSearchResult** (Boolean)

  Use to determine if the Map server control accesses the Ektron search to return results. **True** is the default value. You would change it to **False** if you want to display a map with only one content item, that is, a single location. Specify this item at the `ContentID` property. In this case, the map does not find other Ektron content whose longitude and latitude are within the map's boundaries. Site visitors viewing the map can still use the **Search** and **Directions** tabs to get directions to the location. For example, your site features homes for sale, and you want a map to show a featured home of the week. To do so, set this

property to **False**, and enter the content that describes that home in the **ContentID** field.

- **FolderId** (Long)

  Enter the ID number of the folder whose content is searched on this map. If the `recursive` property is true, folders below this folder are also searched.

- **ForceCategory** (Boolean)

  When set to true, this property causes the map to only show content associated with the taxonomy category defined in the `MapCategory` property. When set to false, the map shows all content within the map's boundaries. For example, if 5 content blocks appear on a map and 3 are assigned to a taxonomy, set this property to True and the `MapCategory` property to the ID of the taxonomy. When a user views the map, it displays the 3 content items associated with the taxonomy.

- **GeoControl** (Boolean)

  If you want to see a search box with tabs above a map, enter **True**. To suppress the text box, enter **False**. See also: .

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **Latitude** (Decimal)

  To set a default map center via latitude and longitude (as opposed to an address), enter the latitude here.

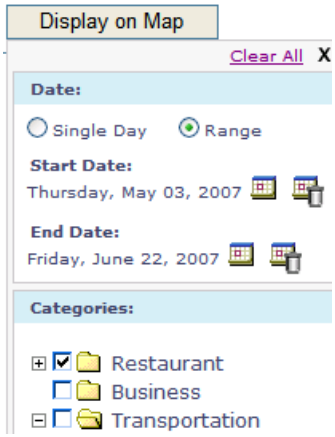
- **Longitude** (Decimal)

  To set a default map center via latitude and longitude (as opposed to an address), enter the longitude here.

- **MapCategory** (Long)

  Enter the ID number of the taxonomy whose categories appear when up click this map's **Display on Map** button. When a map first appears, all eligible content appears. If you click **Display on Map**, you can choose categories and limit the map to items assigned to them. For example, you could view restaurants only. As another example, a map could initially display all campuses in your state college system. Use the **Display on Map** pop-up window to limit the map to community colleges.

  While an OR relationship among categories is the most intuitive and common, you can set up an AND or NOT logical relationship among selected categories.



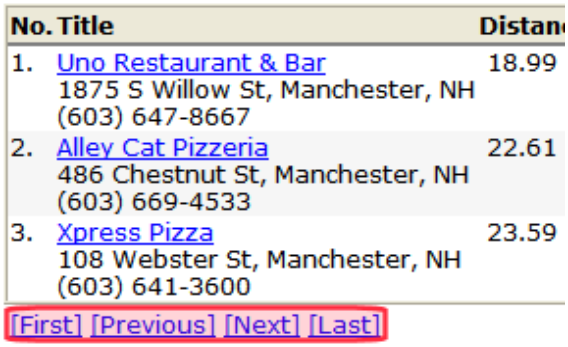
- **MapProvider** (Provider)
  Select the service that provides the map, either Google or Bing Maps for Enterprise.
- **MapStyle** (Style)
  Enter the map's display mode: Road, Satellite or Hybrid. This setting only affects Bing Maps for Enterprise maps.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

  To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

  See also: *Ektron Markup Language* on page 2633

  See also: *map.ekml* on page 2637
- **MinZoomLevel** (Integer)
  If you want to set a map zoom level below which map locations will not appear, enter that value. The default value is 4. Possible values are between 1 (most detailed) and 19.
- **PageSize** (Integer)
  Enter the number of locations that can appear on one page of the text box after a search is executed. See also: . If more than this number of locations are available, use **[First] [Previous] [Next] [Last]** at the bottom of the page to view additional locations.



- **Recursive** (Boolean)

  In the `FolderID` property, you specify a folder whose content is searched on this map. To extend the search to all folders below this folder, set this property to **true**.

- **SelectedCategoryLogicalType** (LogicalType)

  Use this property to determine the logical relationship among several categories on the Display on Map tab. (See). There are 3 choices: OR, AND, and NOT.

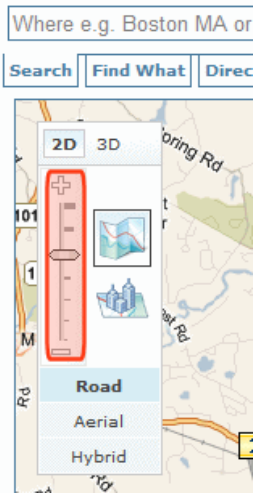
  By default, an OR relationship exists among your selections. So, for example, if all 3 Restaurant categories are checked, then any restaurant that is defined as American, Chinese or Pizza appears on the map. If you change this property's value to AND, only content to which *all* selected categories apply appear on the map. In the above example, only restaurants defined as American *and* Chinese *and* Pizza appear on the map.

  Alternatively, you can set the property's value to NOT. In this case, only content to which the selected categories are not applied appear on the map. To continue the above example, if you select **Chinese**, only restaurants that are not assigned the Chinese category appear on the map.

- **StartZoomLevel** (Integer)

  Enter the zoom level at which the map initially appears. See also: . Zoom level 1 is the least detailed, showing the entire world. Zoom level 19 is the most detailed, showing the smallest streets. By default, maps in the sample site have

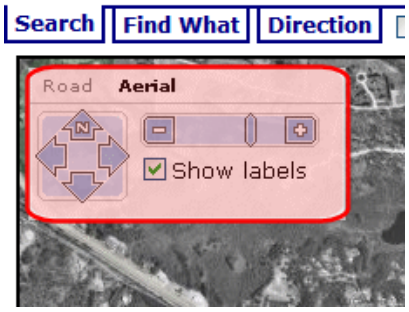
a zoom level of 12, which shows an area of about 10 miles (16 kilometers). A site visitor can adjust the level using the zoom control (circled below).



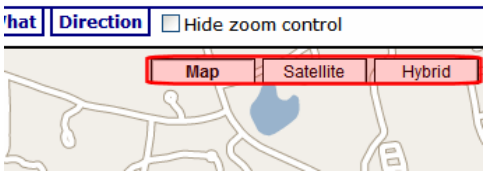
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  NOTE: If you enter a valid EkML file at the `MarkupLanguage` property, the `Stylesheet` property is ignored.

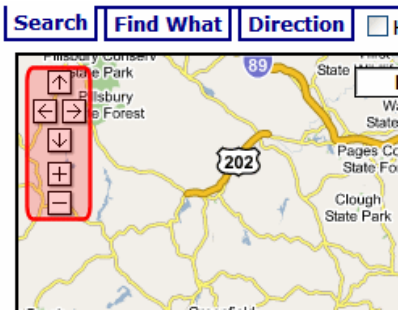
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TemplateParamName** (String)
  Sets a QueryString parameter for the ID of users that are returned in the search results. This parameter is passed to the template page defined in the `TemplateUserProfile` property when a user clicks the Location (map) icon associated with a user.
- **TemplateUserProfile** (String)
  The URL path of the user profile template. The path can be relative or absolute.
- **TypeControl** (Boolean)
  If this map uses Bing Maps for Enterprise maps, this property enables or disables the zoom/direction/type control (highlighted below). It lets you zoom the map in and out, move the center in any direction, and change the display style (Road or Aerial).



If this map uses Google Earth maps, this property enables or disables the type control (highlighted below). It lets you change the display style (Map, Satellite, or Hybrid). Use the `ZoomControl` property to display or suppress Google Earth's zoom and direction controls.



- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.
- **ZoomControl** (Boolean)
  Use this property to display or suppress the Google map zoom control (highlighted below). For Bing Maps for Enterprise maps, the `TypeControl` property determines the zoom control display.



Using the Map server control

The Map server control displays a map that flags locations of interest. Each location is an Ektron content item to which map information was added. For example, if your site hosts a school district, each location could represent one school.

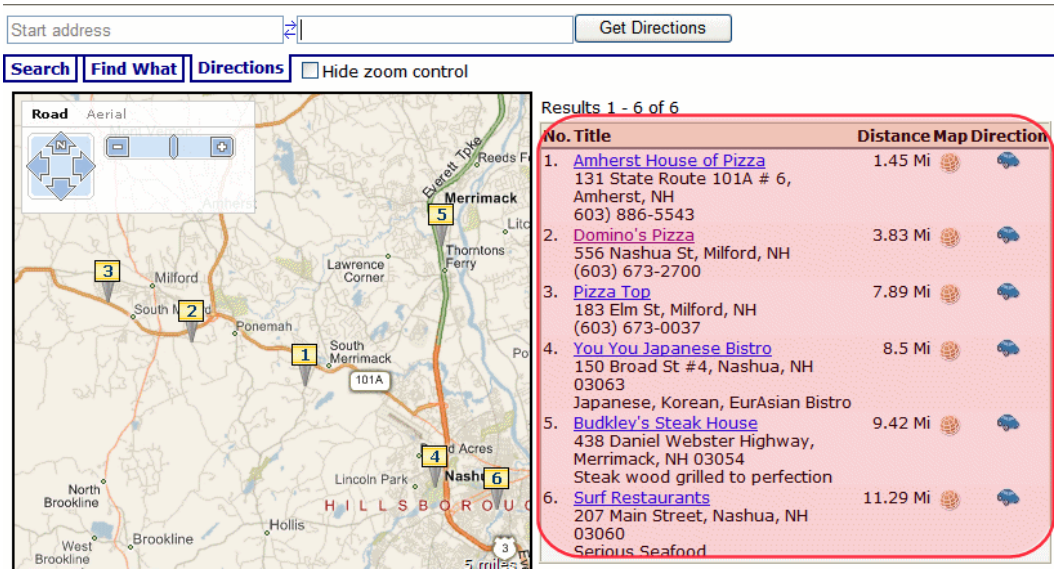
You can zoom the map in and out, get directions to a location, and narrow the list of locations using a text search. For example, if your map initially flags all schools in a geographic area, you can redraw the map to show only schools with a gym.

If you want the map to show events, you can apply dates to Ektron content, which allows searching by date or location.

IMPORTANT: As a map's boundaries change, only locations within boundaries appear. Likewise, if a date is assigned to content, only content within the selected date range appears.

If a map has at least one flagged location, a box can appear to its right with information about each location, which are sorted by distance to starting location. From this box, you can:

- view content to which the location is assigned
- find the distance to a location
- center the map on a location
- get directions to a location



- **No.**. Map item number. The lowest numbered item is closest to the map's center.
- **Title**. The content that corresponds to the numbered map location. Click the title to access that content on your website. The text below the title is the Metadata **Map Address** field, followed by the Metadata **Description** field (see illustration below).
- **Distance**. Distance from the map's center to this content location.
- **Map**. Click icon to recenter map on this content's location.
- **Directions**. Click icon to select the **Directions** tab and paste this content location's address into the end location box. You could then enter a starting location to get directions to this location.

When you hover the cursor over a numbered map location, a text "bubble" appears.

Bubble information:

- **Title**. Content that corresponds to the numbered map location. Click the title to proceed to that content on your website.
- **Summary**. Value of the content's **Summary** tab.
- **Metadata description**. Value of the content's **Metadata Description** field.
- **Get Directions**. Click **To Here** or **From Here** to select the **Directions** tab and paste this location's address into the To or From location box. Then, supply the missing location to get directions between locations.

Ektron supports 2 map providers: Google maps and Bing maps.

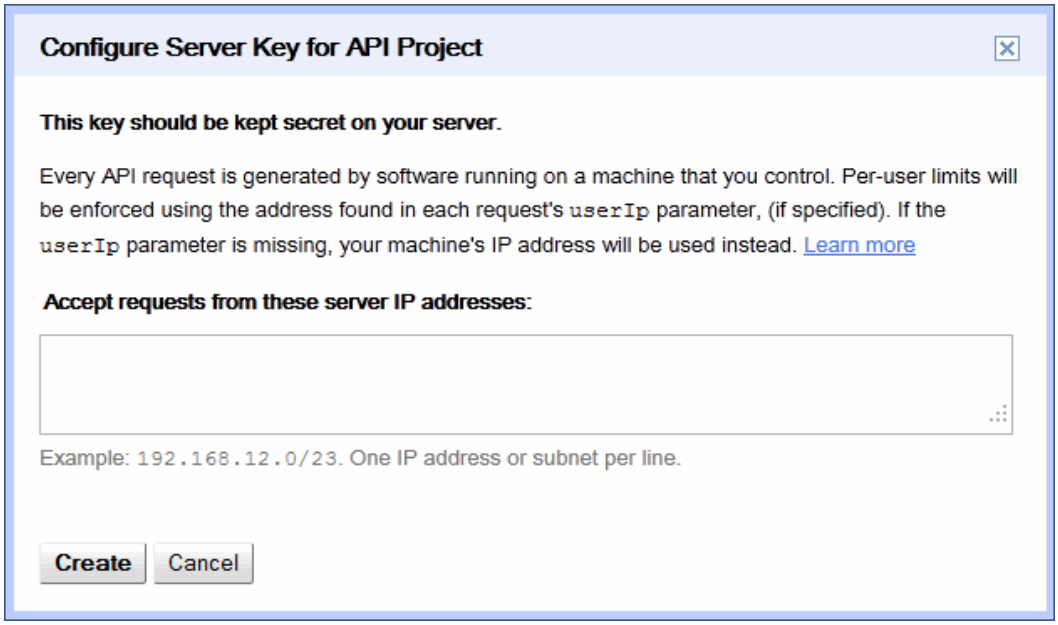
Configuring Google maps

Ektron provides a Google map key that you can use for testing on localhost. If you want to use Google map with your production server, you must install a license key.

Before your production server can use Google's map feature, follow these steps to obtain and install a license key. For Google Map's terms and conditions, see Google Maps/Google Earth APIs Terms of Service.

1. Go to Google APIs.
2. Log into (or create) a Google account.
3. Click **Services** from the left navigation panel.
4. Enable **Google Maps API v3**.
5. Click **API Access** from the left navigation panel.

6. Click **Create new Server key...**



7. Enter 1 or more server IP addresses and click **Create**. A key is created for server apps and browser apps (such as `AIzaSyBcN7RJzxr4f-iOOfdMwUq9op-5xrtOh4M`).
8. Without closing that page, open the *site root*`/web.config` file.
9. Go to the line that begins `<add key="GoogleMap"`.
10. Within that line, replace the following `localhost`key with the key you obtained in Step 7.

```
key="AQWESyCAtPrvLE6I2RTS7xK1-3btrrTO0eO6543"/>
```

Configuring Bing maps

9.10 and higher

Follow these steps to use Bing Maps with the Map server control.

1. Obtain a Bing Map API key (https://www.bingmapsportal.com/).
2. Insert the API key in `web.config`.

```
<add key="BingMapsAPIKey" value="nnnnnnnnnnnnnnnnnn"/>
```

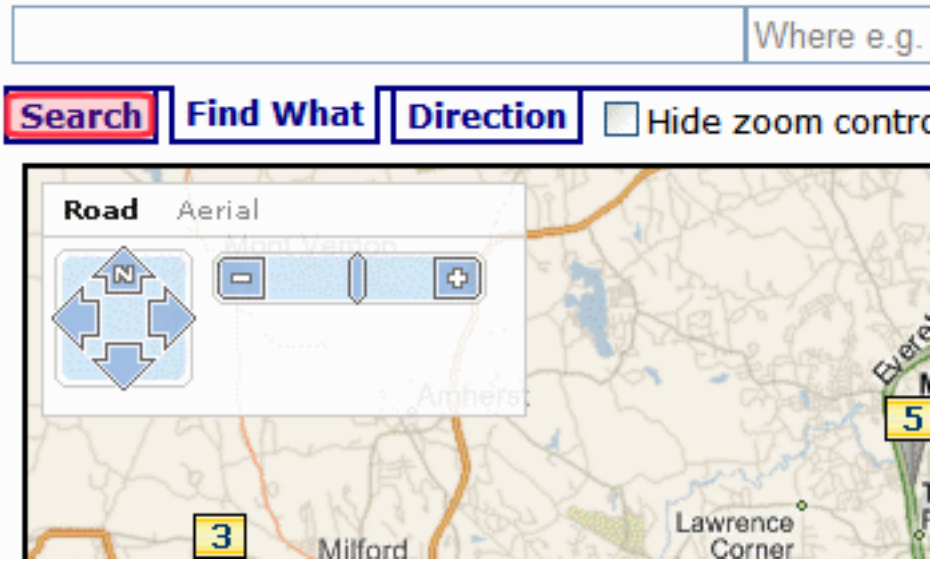
Controlling the map experience

NOTE: Within Visual Studio, you cannot see the map in design mode. But, you can right click the mouse and select **View in Browser** to see the effect of changing properties in a browser.

To learn about customizing the display using the Ektron Markup Language, see *map.ekml* on page 2637.

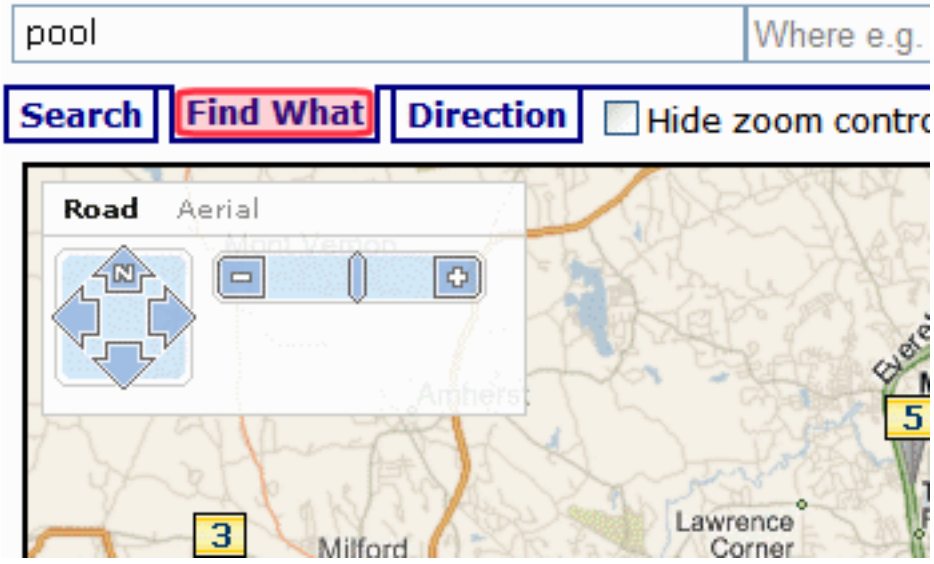
Recentering the map

The **Search** tab lets you recenter the map on a location. You can enter a combination of street address, city, state and zip code and click **Search**. Only content within that geographic area which satisfies other search criteria appears.



Finding Locations with a search term

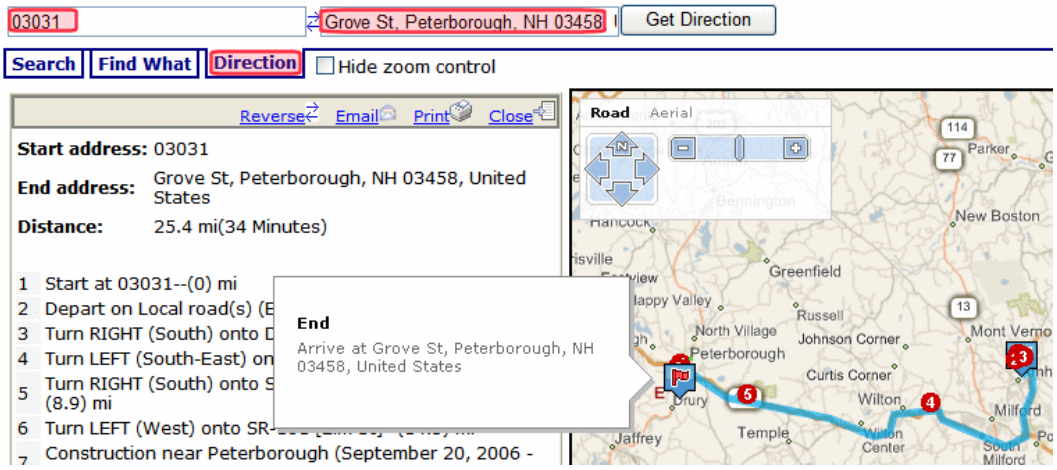
You can use the **Find What** tab to find only locations that include a search term. For example, if a map flags hotels, you can click the **Find What** tab then insert **pool** in the text box above to view only hotels with a pool. The **Find What** tab uses the same logic used in the Web Search to find content on your site.



Getting directions

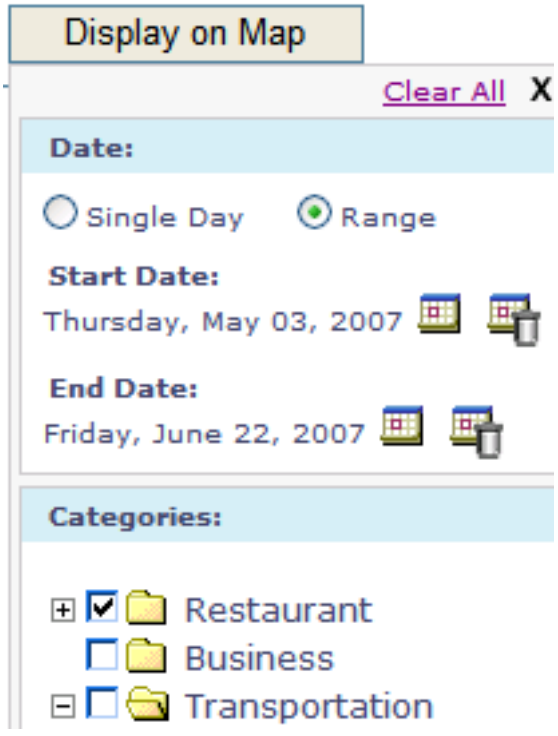
Use the **Directions** tab to get directions between 2 locations. Enter a combination of street address, city, state, and zip code into both text boxes above the tabs and click **Get Directions**. The screen displays text directions on the left, and a map of the directions on the right.

NOTE: To enable the emailing of directions for Bing maps in 9.10 and up, you must configure the system email and SMTP settings. See also: Enabling Email Notification



Restricting locations to taxonomy categories

If you use Ektron's taxonomy feature to classify mapped content, you can click **Display on Map** to restrict the map's locations to content in your categories. The popup window also prompts you to select one or a range of dates, and only retrieves content to which one of the selected dates is assigned.



For example, the category **Restaurant** has 5 subcategories in Ektron's sample site.

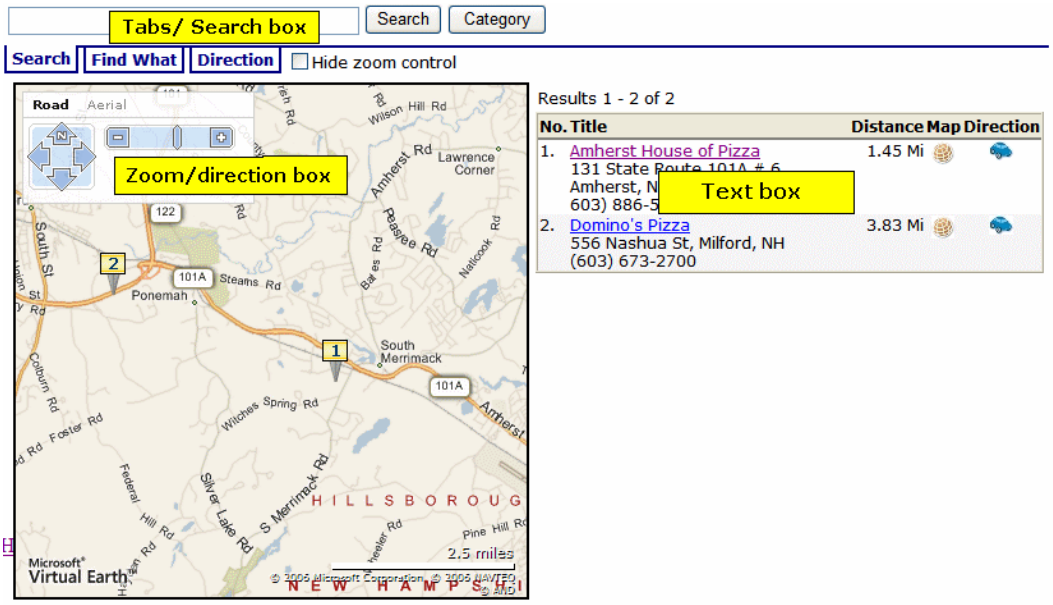
When you use the map, you can click **Display on Map**, see your content's categories, and select those of interest. The map updates to show content in selected categories only. To learn about assigning taxonomy categories to content, see Organizing Content with Taxonomies.

NOTE: While an OR logical relationship among selected categories is the most intuitive and common, you can set up AND or NOT relationships among categories.

Displaying/suppressing map elements

You can use Map properties to display or suppress the following map elements.

- Tabs/Search box. GeoControl
- Text box. DisplayTextResult
- Zoom/direction. ZoomControl; for Bing Maps in 9.10 and up, or for Enterprise maps, this property also controls the Map type selection.
- Map type (road, satellite, combination). TypeControl; affects only Google maps.



Setting a map's initial boundaries

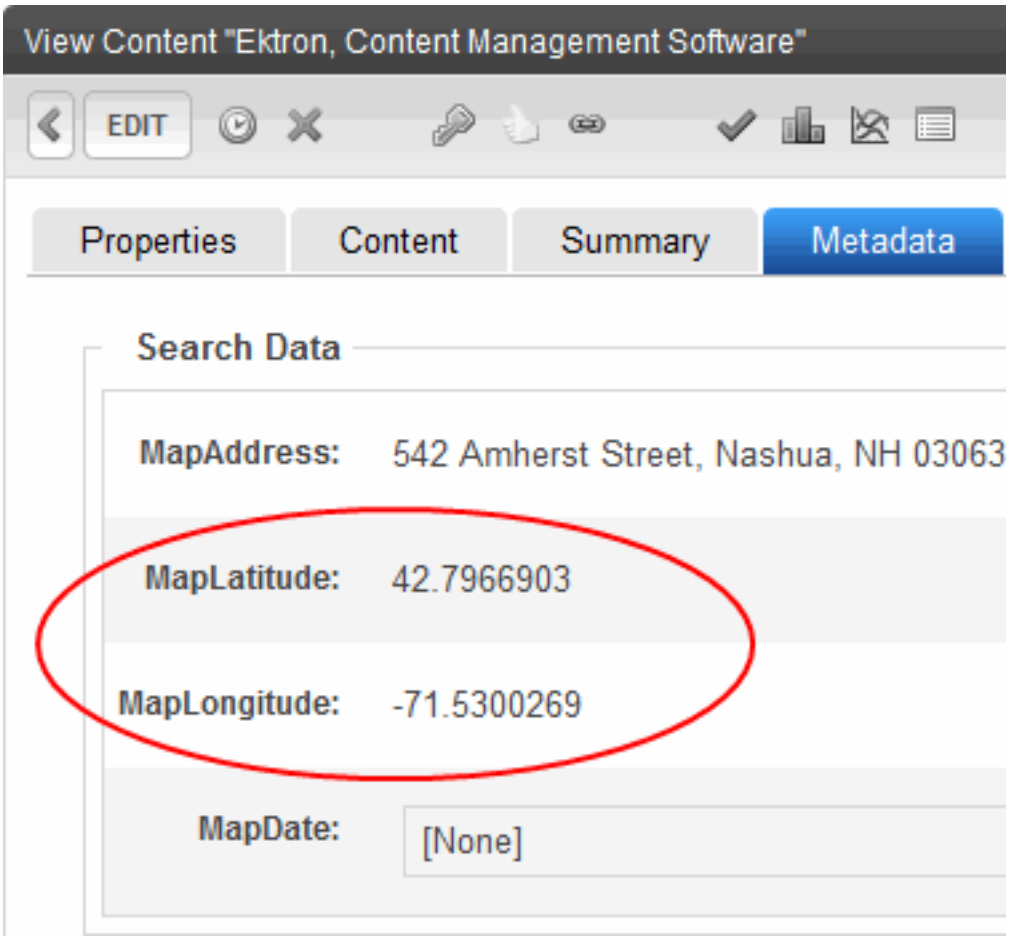
Because the map only displays content whose address lies within the map's boundaries, focus the initial display on your businesses/locations. Map properties let you specify a beginning address (or longitude/latitude) and a starting zoom level. All content with address data within that area is flagged on the map.

If your locations are too spread out to appear on a single map, create several regional maps. Each map server control must appear on a separate Web form.

IMPORTANT: You cannot place more than one map server control on a Web form.

Setting content found on a map

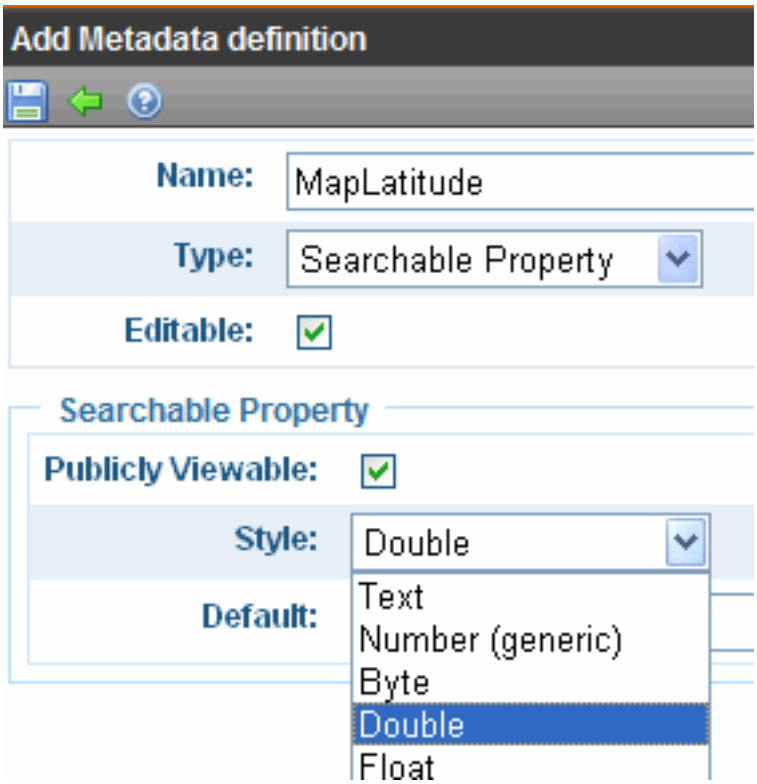
Whether you use Google or Bing Maps for Enterprise maps, content must have latitude and longitude values to appear on a map.



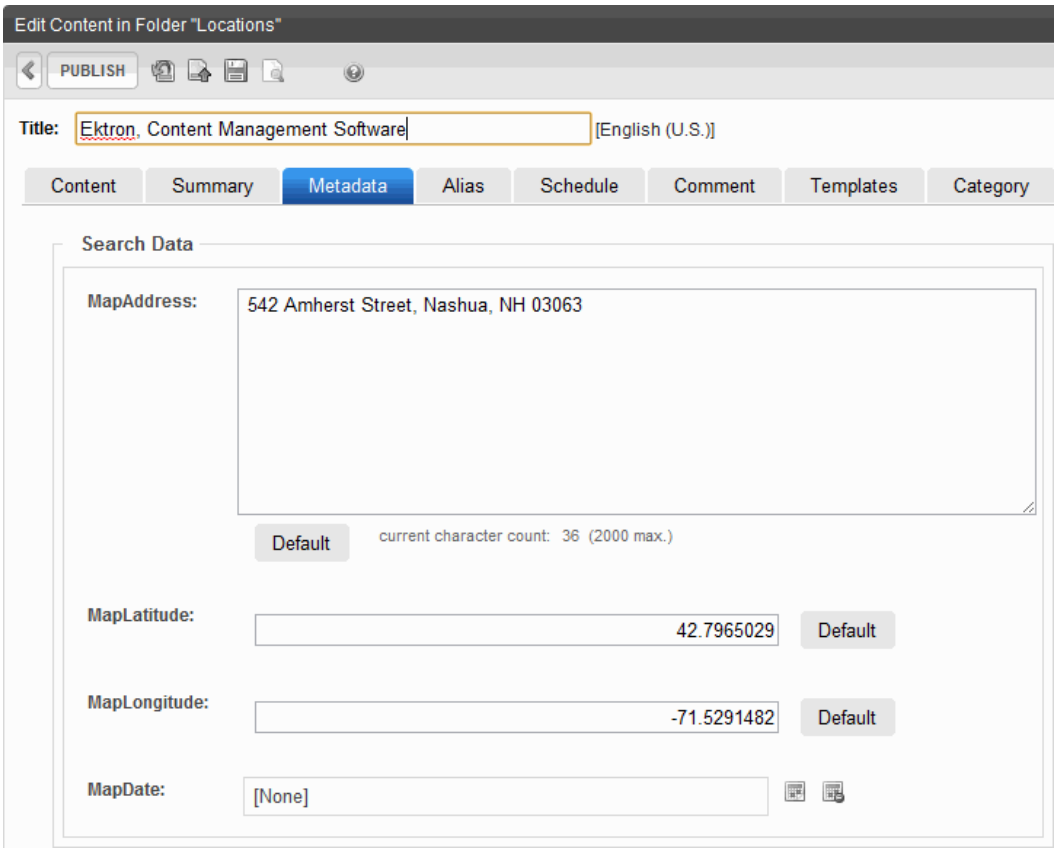
Google maps take a content item's address and return its latitude and longitude. You don't need to use Google's automatic retrieval of latitude and longitude. Instead, you can enter the values manually. To do so, open the content item, go to its metadata, and enter the latitude and longitude values under **Search Data**.

To automatically obtain latitude and longitude information for a content item:

IMPORTANT: The following procedure assumes you are using Ektron's sample site. If you are using the Min site, you must create searchable metadata definitions for **Map Address**, **Map Latitude** and **Map Longitude**. When defining **Map Latitude** and **Map Longitude**, set their **Style** to **Double**. If you are using dates with metadata, set **MapDate**'s style to **Date**.



1. Obtain a Google maps license key. See *Configuring Google maps* on page 2473
2. Create the content if necessary. On the content's **Metadata** tab, under **Search Data**, enter a **MapAddress** (that is, any combination of street, city, state, and zip code).



If you enter only a zip code, the latitude and longitude are set to that post office.

3. Publish the content.

   This action creates the Web services call to Google maps, which retrieves the latitude and longitude for each address. If Google maps cannot find a latitude and longitude (usually due to insufficient or conflicting information), it writes failure information to your server. You can view this under **Windows Event Viewer > EktronLog**. Any event's properties explain why the retrieval of latitude and longitude failed.

Restricting content for a particular map

You may want a map to show a subset of all content with a latitude and longitude. For example, your business includes restaurants and bakeries, and you want a map to show only bakeries.

To accomplish this, place content for restaurants in one folder, and bakeries in another. Then, in the map server control that shows bakeries only, at the `FolderID` property, identify the bakeries folder.

If you want another map to show both restaurants and bakeries, create the restaurant and bakery folders under a parent folder. Then, in that map server control's `FolderID` property, identify the parent folder, and set the `Recursive` property to **true**.

Membership

8.50 and higher

The Membership server control has a tabbed form that lets a site visitor create or update a profile. The control also can present new membership users with terms and conditions for using Discussion Boards when needed. See also: Membership Users and Groups.

NOTE: You can view the Membership server control on the OnTrek starter site when you edit your profile.

IMPORTANT: You cannot use the Membership server control with CMS users.

Users specify the following information in the Membership server control tabs.

Inserting the Membership server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

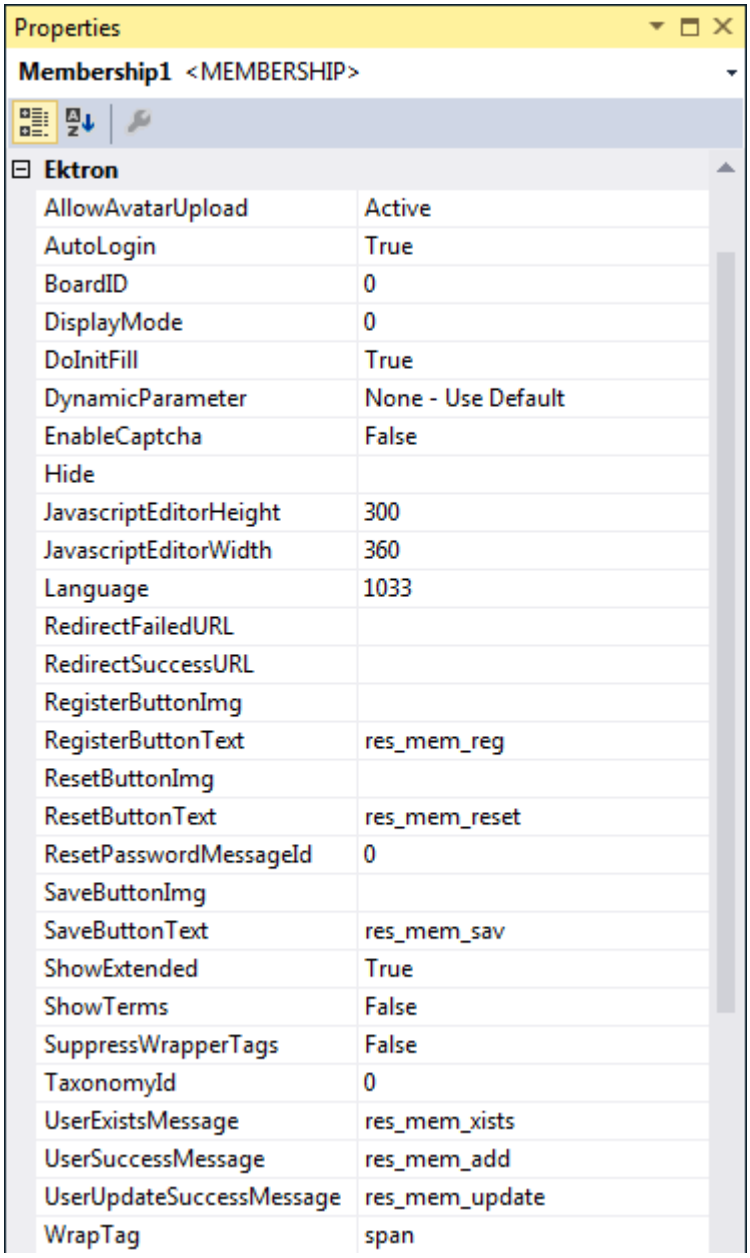
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Membership** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:Membership ID="Membership1" runat="server" />
   ```

4. Click on `Membership` in the code to display and modify the control's properties using the properties window of Visual Studio. The page is updated as you modify

the property values.



Membership properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AllowAvatarUpload** (String)

  When set to **Active**, **Click to upload your avatar** appears on the **General** tab. This allows site visitors to upload an avatar when registering for the site. When set to **Disable**, the link is hidden. To force site visitors to choose from a gallery of avatars, enter a path to the template containing them.

- **BoardID** (Long)

  The ID of the Discussion Board for which to show the Terms and Conditions. If you don't know the ID, click **Ellipses**, then sign in, browse to and select the Discussion Board.

- **DisplayMode** (Mode)

  Lets a developer decide what type of membership form is added to the Web form. The following describes possible settings.

  - **User Registration**. Lets a site visitor register as a membership user. Also allows membership users to update their information and preferences when logged in.
  - **Reset Password**. Lets a membership user reset a password.

    NOTE: Starting in Ektron 9.10, password restrictions defined in the Application Setup screen's **Regex** tab are not applied when memberships users reset their password. See also: Password Regex Tab.

    See also: Ektron Knowledge Base article "Changing the Membership User Password Reset Message".
  - **Unsubscribe Secured**. Lets membership user unsubscribe by entering a username and password.
  - **Unsubscribe Unsecured**. Lets membership user unsubscribe by entering a username.
  - **Account Activate**. Let a site visitor activate a membership by entering the ID number sent in the account verification email.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter**

  To make this control dynamic, select id. When you do, this server control is attached to the user passed as a URL parameter.

- **EnableCaptcha** (Boolean)

  Use to add a Captcha control for more security. It looks like this.

  
  - **True**. Show Captcha
  - **False**. Hide Captcha

If this property is set to **true**, Captcha appears while the control is in **User Registration**, **Account Activate**, or **Reset Password** mode. See www.captcha.net for more information about Captcha.

- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **JavascriptEditorHeight** (Integer)
  Set the height in pixels for the eWebEdit400 editor. The default is **300**.
- **JavascriptEditorWidth** (Integer)
  Set the width in pixels for the eWebEdit400 editor. The default is **360**.
- **Language** (Integer)
  Set a language for the server control. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **RedirectFailedURL** (String)
  The URL to which a membership user is sent if the registration fails.
  - If the page resides in the same folder as the registration page, enter the page name. For example, **RegFailed.aspx**.
  - If the page resides in a subfolder, enter its path. For example, **members\RegFailed.aspx**.
- **RedirectSucessURL** (String)
  The URL to which a membership user is sent when the registration succeeds.
  - If the page resides in the same folder as the registration page, enter the page name. For example, **RegSucceed.aspx**.
  - If the page resides in a subfolder, add its path. For example, **members\RegSucceed.aspx**.
- **RegisterButtonImg** (String)
  Lets you replace text on the register button with an image. Enter a path to the image. For example:

  ```
  http://www.example.com/buttons/registerbutton.gif
  ```

  If the image is located in the site root, enter only the subfolder path and image name. For example: `/buttons/registerbutton.gif`
- **RegisterButtonText** (String)
  Text that appears on the Register button. The default is **Register**. If you use a register button image, you do not see this text.
- **ResetButtonImg** (String)
  Lets you replace text on the reset button with an image. Enter a path to the image. For example:

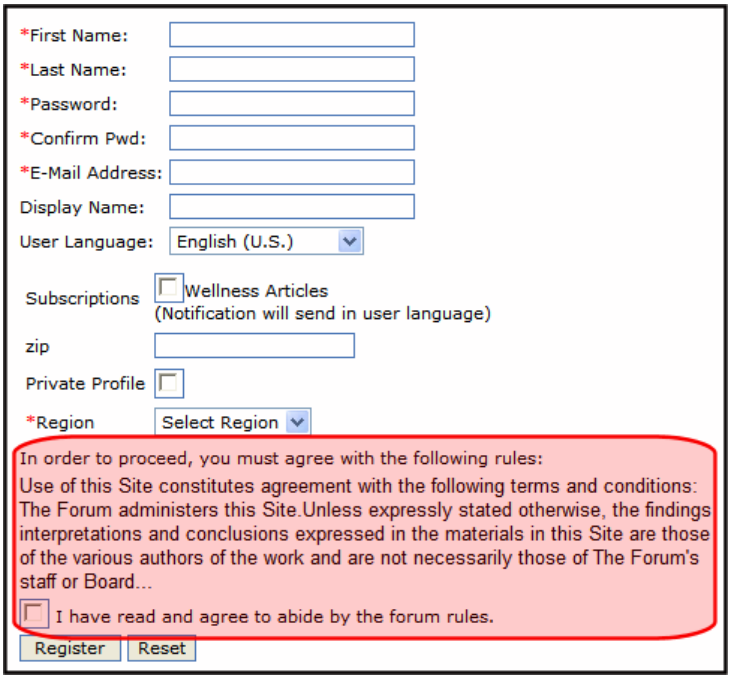
  ```
  http://www.example.com/buttons/resetbutton.gif
  ```

If the image is located in the site root, enter only the subfolder path and image name. For example: `/buttons/resetbutton.gif`

- **ResetButtonText** (String)
  Text that appears on the reset button. The default is **Reset**. If you use a reset button image, you do not see this text.
- **SaveButtonImg** (String)
  Lets you replace text on the Save button with an image. Enter a path to the image. For example:

  ```
  http://www.example.com/buttons/savebutton.gif
  ```

  If the image is located in the site root, enter only the subfolder path and image name. For example: `/buttons/savebutton.gif`
- **SaveButtonText** (String)
  Text that appears on the save button. The default is **Save**. If you use a save button image, you do not see this text.
- **ShowExtended** (String)
  Decide if the Custom User Properties Tab is available when using this control. The default setting is **True**.
  - **True**. Show Custom User Properties tab.
  - **False**. Hide Custom User Properties tab. For more information, see Creating Custom User properties.
- **ShowTerms** (Boolean)
  Terms and Conditions are defined for the Discussion Forum specified in the Membership server control's `BoardID` property. If you set the `ShowTerms` property to `True`, the Terms and Conditions for the forum identified in the control's `BoardID` property appear near the bottom of the Membership server control. A membership user must check the box to complete a registration.



If Terms and Conditions are defined for the specified Discussion Board and `ShowTerms` property is set to `False`, you must accept the Terms and Conditions the first time you create a post or a reply.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **TaxonomyID** (Long)

  The ID of a taxonomy available to users. A user editing or creating a profile can select which categories from this taxonomy to associate with their profiles.
- **UserExistsMessage** (String)

  The message that appears when a membership user already exists. The default message is: **Username(email) already exists!**
- **UserSuccessMessage** (String)

  The message that appears when a membership user successfully registers. The default message is: **You have registered successfully**. You can also use this property to set the message that appears when users successfully unsubscribe or reset their password. To do this, enter the success message in this property and set the `DisplayMode` property to the proper usage.
- **UserUpdateSuccessMessage** (String)

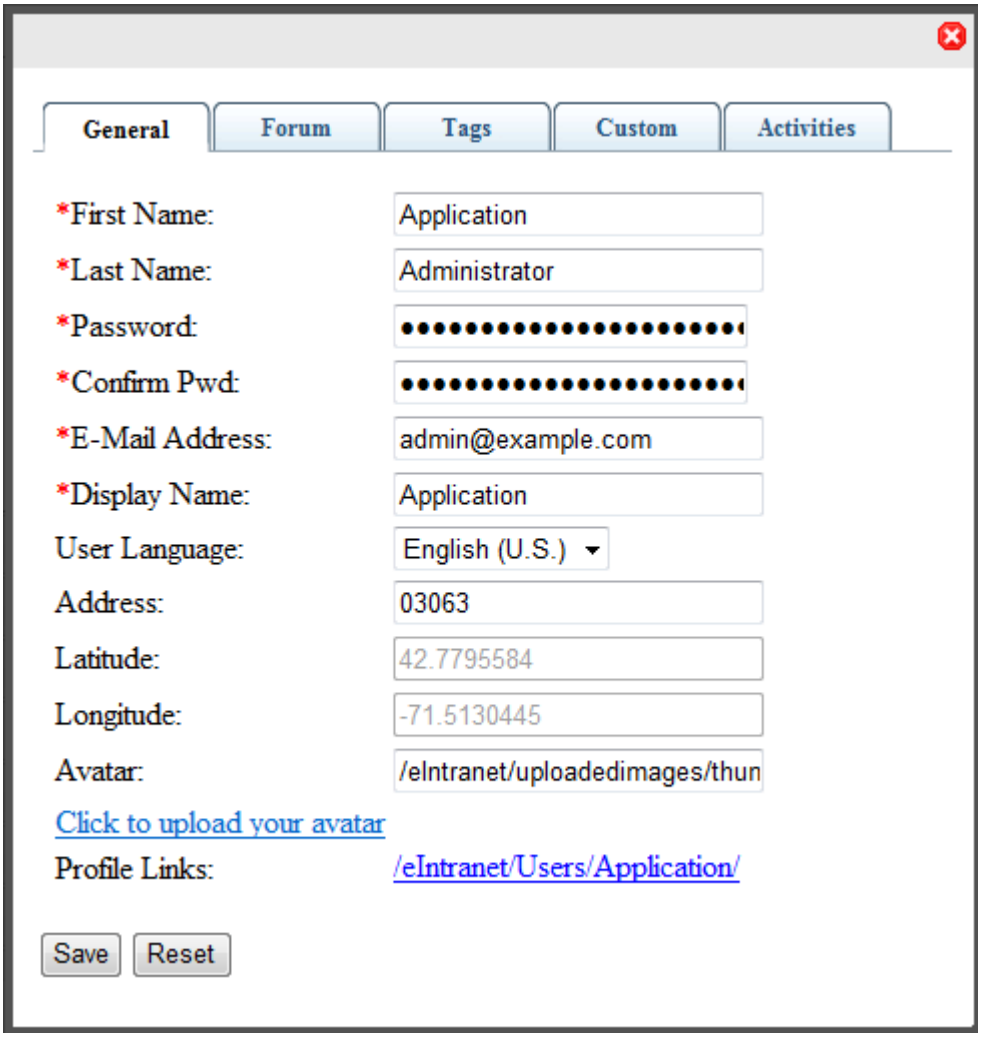
  The message that appears when a membership user successfully updates their information. The default message is: **You have successfully updated your information.**
- **WrapTag** (String)

  Lets a developer specify a server control's tag.

- **Span** (default). Designate an inline portion of an HTML document as a span element.
- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

General tab

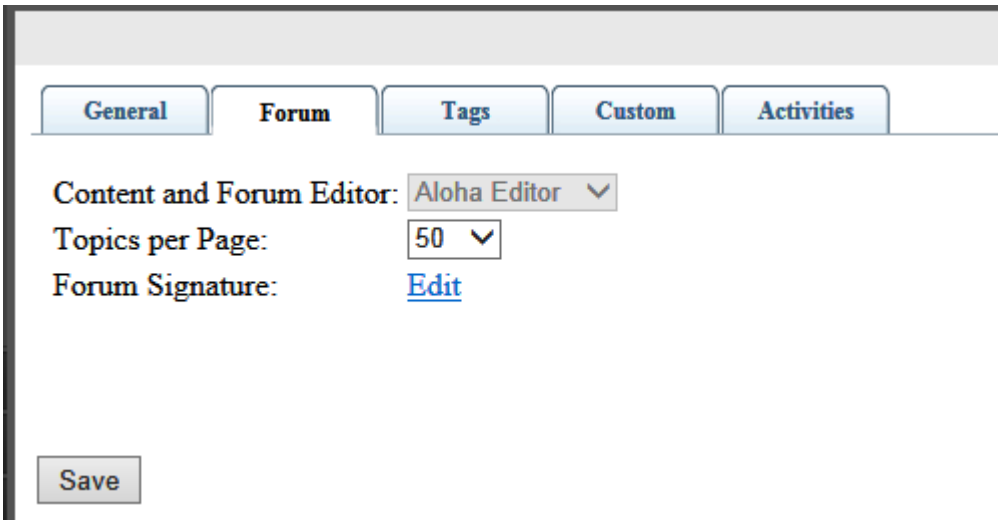
Fields with a red asterisk (*) are required fields.



- **First name**. Enter your first name.
- **Last Name**. Enter your last name.
- **Password**. Enter a password.
- **Confirm Password**. Re-enter the password.
- **E-Mail Address**. Enter your email address. Notification email is sent to this address unless the **Disable E-mail Notification** field is checked. Also, this address identifies the user sending Instant email.
- **Display Name**. Enter the name you want to display to others, which can be a nickname or title.
- **User Language**. Select from available languages.

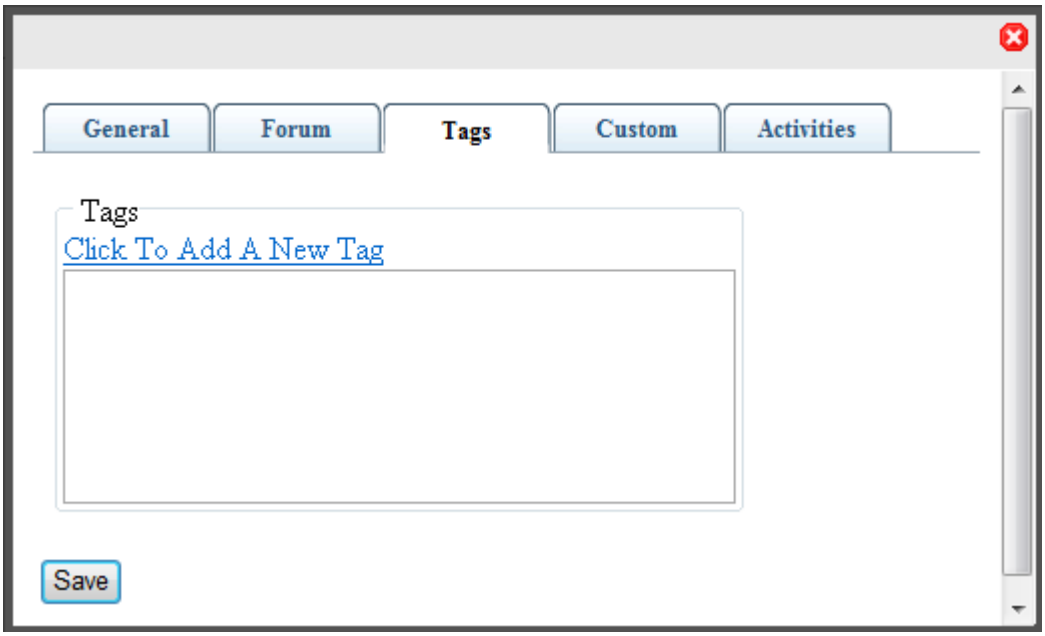
- **Address**. Enter the address (or just the zip code) of where you are located.
- **Latitude**. This field is automatically determined by the address.
- **Longitude**. This field is automatically determined by the address.
- **Avatar**. Click **Click to upload your Avatar** and choose an image file that you want to associate with your profile. By default, the maximum file size of an avatar is 200 kilobytes. Also, the avatar's height and width cannot exceed 125 pixels preserving the aspect ratio.

Forum tab



- **Content and Forum Editor**. If the Ektron administrator has chosen an editor, it appears but cannot be changed. Otherwise, possible editors appear in a drop-down, and you can choose one. See also: Changing the Default Editor.
- **Topics per Page**. Select a number of topics to display on a page. If the number of topics exceeds the number you select, a scroll bar lets you see the additional topics. For example, if you select 10, and there are 25 topics, only 10 are displayed at one time, but you can scroll down to see all topics.
- **Forum Signature**. Click **Edit** to enter or modify a signature that appears below each post you make to a forum topic.

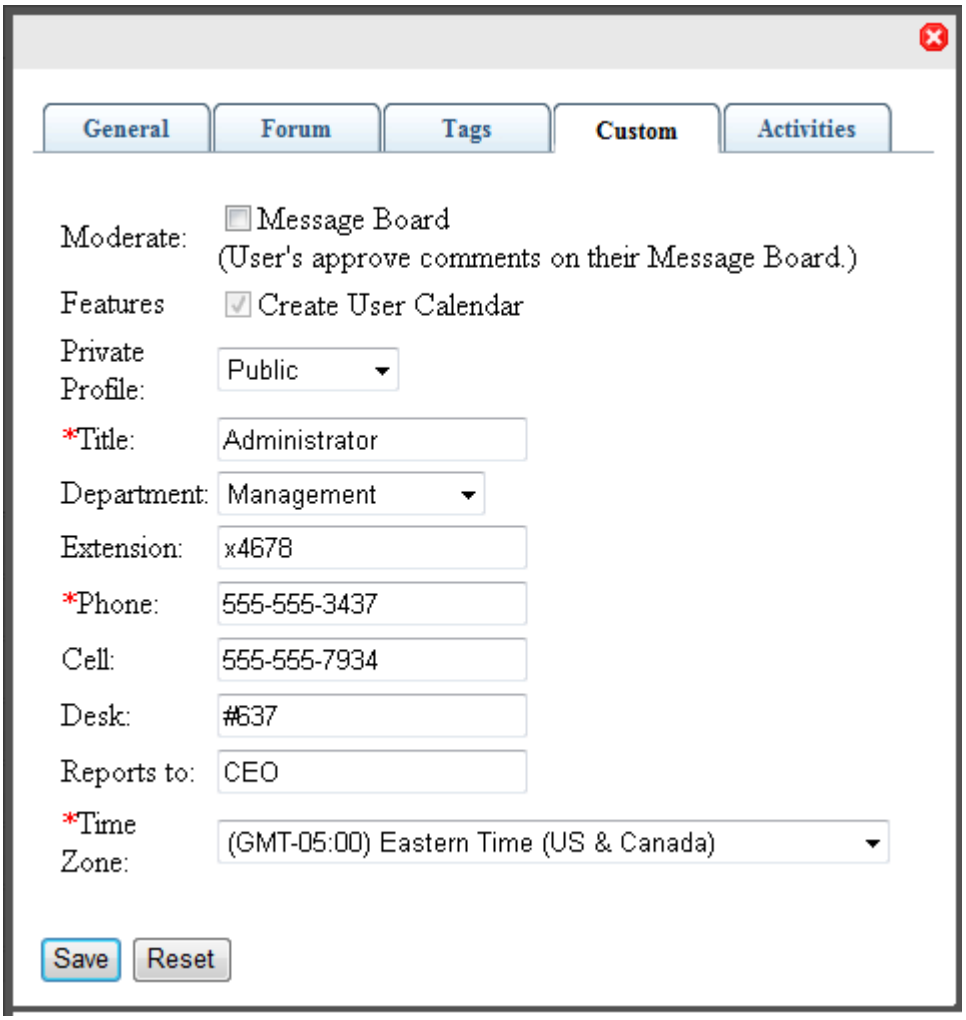
Tags tab



- **Tags**. Keywords that you can assign to content and library items, which allows for tag-based searching. For example, you can add the tag **EAC** (Employee Activity Committee), and tag users related to the EAC. In this way, you can search for the users to which the **EAC** tag is applied. A tag cannot exceed 25 characters, and can include only alphabetical or numeric characters, a hyphen, or an underscore.

Custom tab

Fields with a red asterisk (*) are required fields.



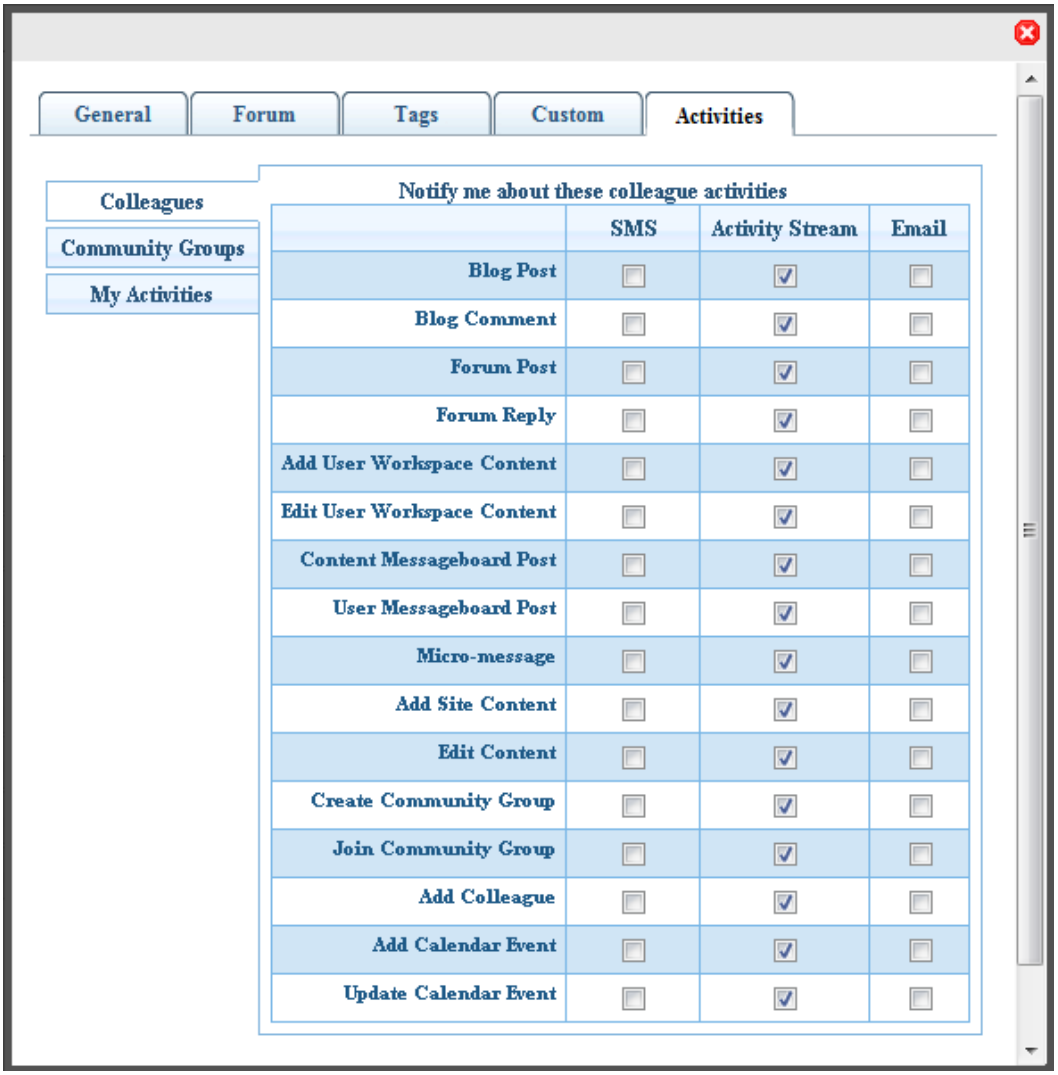
- **Moderate**. Check this box to give this user privileges on a message board to approve and delete posts. Regular users in a group message board can create and delete only their own posts.
- **Features**. Check this box to give the user an individual calendar. (There may be other features to grant also.)
- **Private Profile**. Choose an option:
  - Public. User information is accessible by others.
  - Private. User information is not accessible by others.
  - Colleagues. User information is accessible only by colleagues of the user.
- **Title**. Enter the title of the user.
- **Department**. Select the department to which this user belongs. The list contains any departments that you have created.
- **Extension**. Enter the user's telephone extension.
- **Phone**. Enter the user's company telephone number.
- **Cell**. Enter the user's cell phone number.

- **Desk**. Enter the value that identifies the location of the desk (or cubicle, or office), if your office identifies such things. This can be valuable in locating an employee on an office map.
- **Reports to**. Enter the person to whom the user reports. This can be valuable for developing organizational charts.
- **Time Zone**. Select the time zone where the user works.

Activities tab

By default, all activity is checked for the Activity Stream widget.

Check boxes to select criteria for activity types you want to see from colleagues or community groups. You can also select activity that you want colleagues to see, under the **My Activities** subtab. See also: Sending Notifications to a Community.



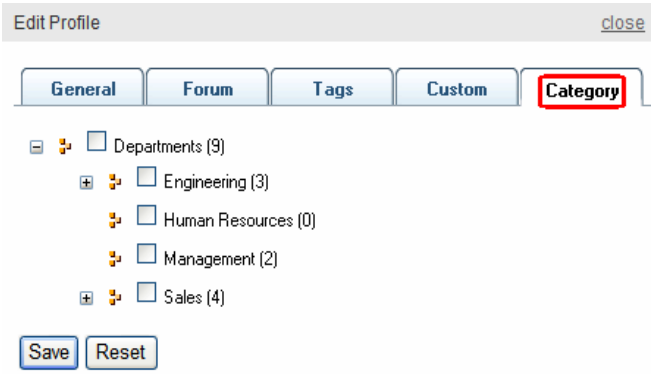
- **SMS**. A checked box indicates that the activity type will be sent to your cell phone Short Message Service (SMS).
- **Activity Stream**. A checked box indicates the activity type that will appear in the Activity Stream widget.

- **Email**. A checked box indicates the activity type that will be sent to your Email address, which is specified in your profile's General tab.

Category tab

The Category tab lets you select from a list of taxonomy categories with which you want to be associated. You determine which taxonomy appears on the tab by setting the `TaxonomyID` property.

IMPORTANT: The Category tab appears only when an ID is assigned to the `TaxonomyID` property.

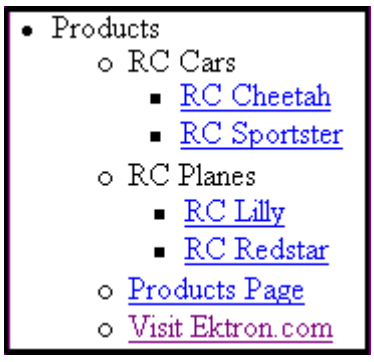


Menu

8.50 and higher

IMPORTANT: Starting with Release 8.6, the Menu server control was replaced by the FrameworkUI: <ektron:MenuView> templated server control. If you are already using the Menu server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The Menu server control calls a menu to be displayed on a page. Using the Menu server control, you can manipulate a menu by using the `DisplayXslt` property. Below is a menu display with the SampleMenu XSLT.



Before you can use the Menu server control, you must create a menu in the Workarea.

This section also contains the following topics.

Inserting the Menu server control onto a page

PREREQUISITE

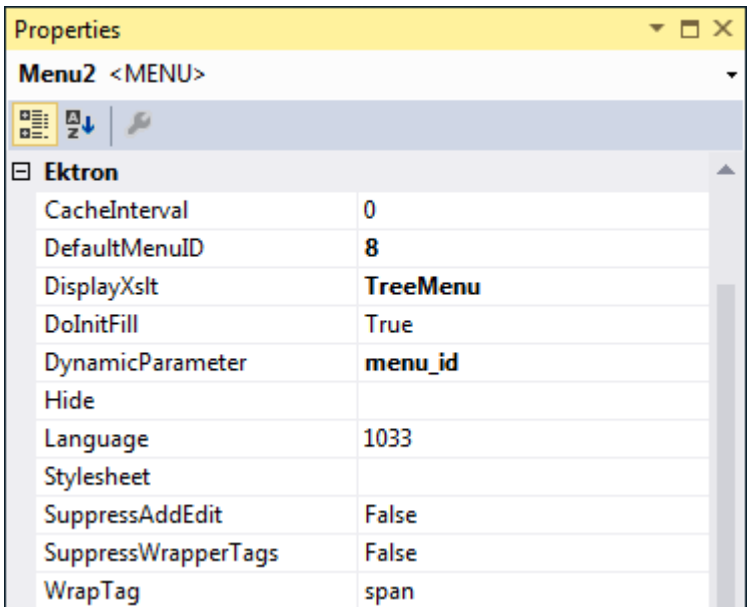
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Menu** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Menu ID="Menu1" runat="server" />
```

4. Click on `Menu` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Menu properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual

Studio® help.

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DefaultMenuID** (Long)
  The ID of a menu that appears where you insert this server control if no other menu is identified or available. If you don't know the ID number of the menu, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147
- **DisplayXslt** (String)
  The XSLT to use to render the menu.
  - **None**. Databind only
  - **SampleMenu**. A sample display, formatted as a bulleted menu list
  - **TreeMenu**. A sample display, formatted as a folder tree. You can expand the tree by clicking on the folder icon.
  - **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  For more information on using the SampleMenu and TreeMenu DisplayXslt, see *Using DisplayXslt samples* on the next page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  Select **menu_id**. When you do, this server control uses the menu passed as a URL parameter.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

For more information, see Creating a Menu in Another Language.

- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control.

  Leave blank to use the default style sheet.

  To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.

  The default style sheet is `\webroot\siteroot\Workarea\csslib`.

- **SuppressAddEdit** (Boolean)
  - **True**. Suppress the Add and Edit buttons when a user is logged in.
  - **False**. Show the Add and Edit buttons when a user is logged in.

  The default is False.

- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

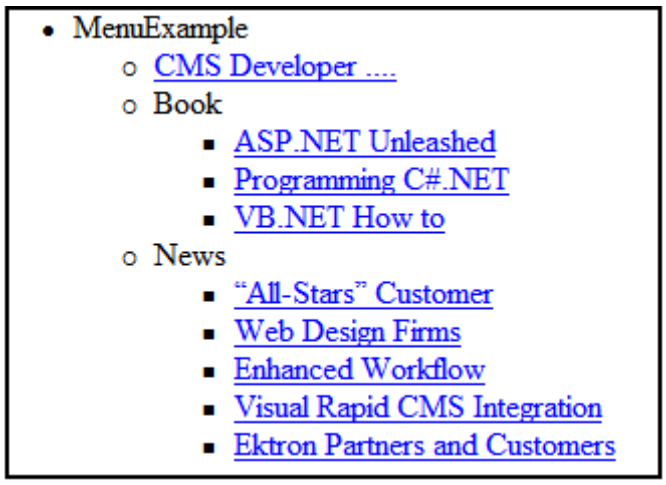
Using DisplayXslt samples

Two DisplayXslt samples are provided with the Menu server control, SampleMenu and TreeMenu. This section explains how to use them.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

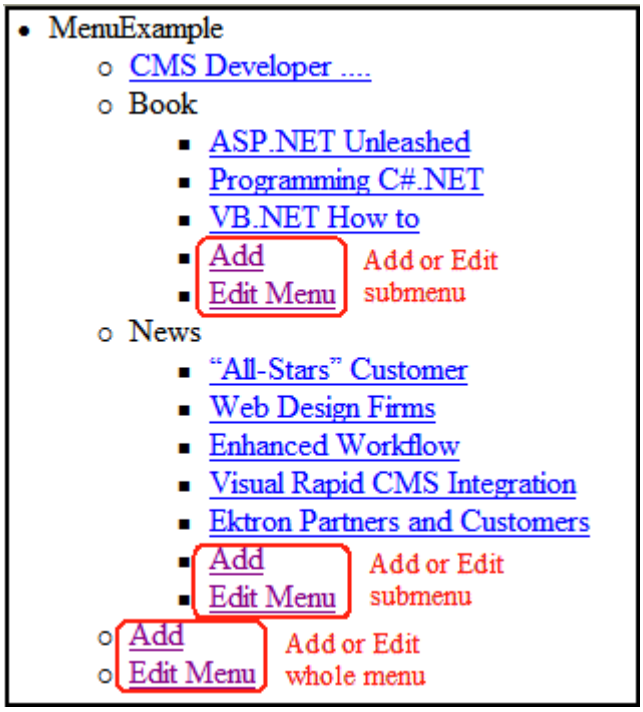
SampleMenu

The SampleMenu DisplayXslt lets you display an Ektron menu as a bulleted item list. See below for an example.



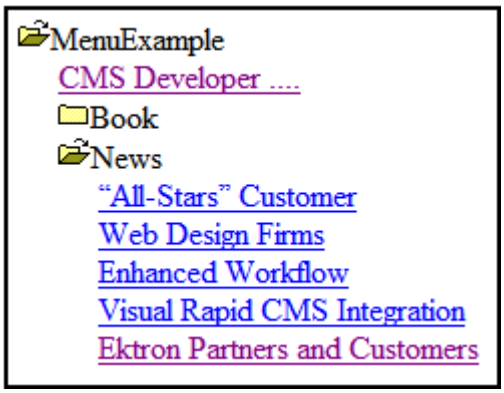
When you are logged in to your Ektron site, 2 menu items are added to each section of the menu: Add and Edit Menu. The user can use these to add a new menu item or edit an existing one. See example below.

For information on a adding or editing a menu item, see Adding a Menu Item.



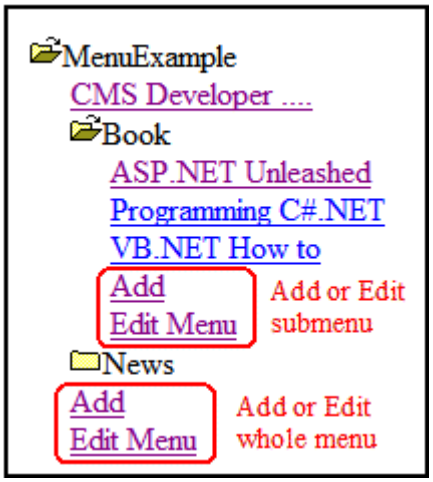
TreeMenu

The TreeMenu DisplayXslt lets you display an Ektron menu as a clickable folder list. You can expand and collapse the menu by clicking on the folder icons.



When you are logged in to your Ektron site, 2 menu items are added to each section of the menu: Add and Edit Menu. The user can use these to add a new menu item, or edit an existing menu item. See example below.

For information on a adding or editing a menu item, see Adding a Menu Item.



NOTE: When using the TreeMenu server control with Visual Studio and Windows 2003, the folder images do not display during design-time. They do, however, display correctly during run-time.

Retrieving the XML structure of a menu

Retrieving a menu's XML structure provides greater control over developing XSLs. The following is an example of how to retrieve the XML structure:

1. Open a new Web form.
2. Drag and drop a Menu server control onto it.
3. Set the `DefaultMenuID` properties.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to MultiLine.
6. Set the width of the text box to at least 400px.
7. On the code-behind page, add the following line.

```
Textbox1.Text = Menu1.XmlDoc.InnerXml
```

8. Build the project.
9. View the Web form in a browser.
10. The XML structure of the menu appears in the textbox.

Metadata

8.50 and higher

The Metadata server control lets you add the metadata from content blocks to a Web page. This lets developers add metadata quickly without having to type it in. You can add metadata from a single content block, multiple content blocks, or dynamically pass a content ID from a URL.

In contrast, the MetaDataList server control lets you create a list of content blocks to display on your site, based on metadata assigned to the content. See also: *MetadataList* on page 2503.

Inserting the MetaData server control onto a page

PREREQUISITE

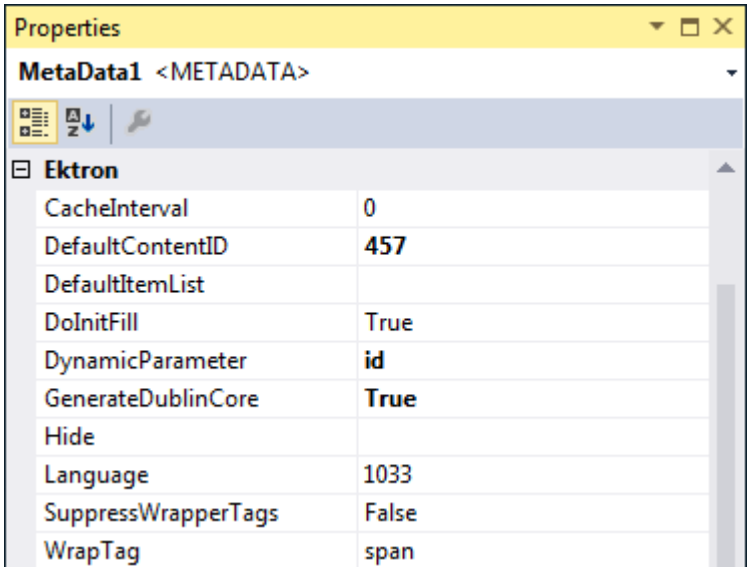
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **MetaData** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:MetaData ID="MetaData1" runat="server" />
   ```

4. Click on `MetaData` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Metadata properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DefaultContentID** (Long)

  Enter the ID of the content block whose metadata is added to the page. If you don't know the ID number of the content block, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147. If you want to add metadata from several content blocks, set this property to 0 (zero) and use the `DefaultItemList` property to identify them.

- **DefaultItemList** (String)

  A bracket-separated list of content block IDs whose metadata added to the page. This list is used only if the `DefaultContentID` property is set to 0 (zero). For example:

  DefaultItemList **[92][12][4][7]**

  In the ID list, you can specify metadata definitions to *exclude* for each content block. To exclude a metadata definition, insert a semicolon after the ID and enter the metadata definition. For example,

  DefaultItemList **[30][10;Title][23;Title;Description]**

  In the above example, the control will:

  - add all metadata definitions for content block 30
  - exclude the `Title` metadata definition for content block 10
  - exclude the `Title` and `Description` metadata definitions for content block 23

  Note the following criteria for metadata definitions that may be excluded:

  - the definition is case-sensitive, so must exactly match how the **Name** field of the Metadata Definitions screen.

    
  - The metadata definition type must be **Meta Tag**

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **DynamicParameter** (String)

  Gets or sets the QueryString parameter to read a content ID dynamically.

- **GenerateDublinCore** (Boolean)
  When enabled, this property automatically creates 7 of the Simple Dublin Core metadata fields from standard Ektron system properties. The default is false.
  - **True**. Generate Simple Dublin Core metadata fields
  - **False**. Do not generate Simple Dublin Core metadata fields

  The 7 fields and how they are associated with the Ektron properties is explained in Applying Simple Dublin Core Metadata
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

These steps show how to use the MetaData server control.

1. Drag a MetaData server control onto a template.
2. Set the properties of the Metadata server control. This will create the following HTML in the HTML body.

   ```
   <cms:MetaData id="MetaData1" runat="server"
   DefaultContentID="12"></cms:MetaData>
   ```

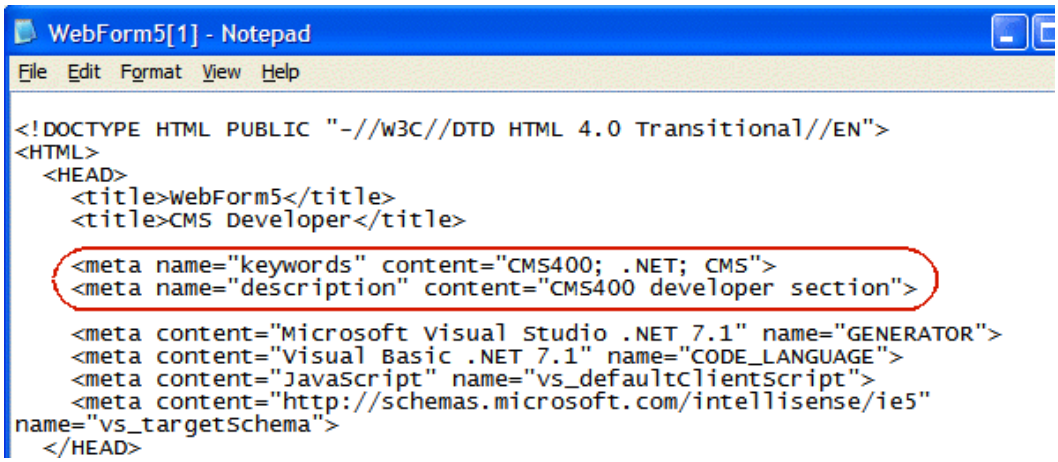
   Or, if you are using multiple content block IDs in the `DefaultItemList`, the following HTML is created.

   ```
   <cms:metadata id="MetaData1" runat="server" DefaultItemList="[12,7,4]">
     </cms:metadata>
   ```

3. Click the **HTML** tab and copy that line from the <body> tag to the <head> tag.

```
<HEAD>
    <title>WebForm5</title>
    <cms:MetaData id="Metadata2" runat="server" DefaultContentID="12"></cms:MetaData>
    <meta name="GENERATOR" content="Microsoft Visual Studio .NET 7.1">
    <meta name="CODE_LANGUAGE" content="Visual Basic .NET 7.1">
    <meta name="vs_defaultClientScript" content="JavaScript">
    <meta name="vs_targetSchema" content="http://schemas.microsoft.com/intellisense/i
</HEAD>
<body>
    <form id="Form1" method="post" runat="server">
    </form>
</body>
```

4. Save the Web form and rebuild the solution.
5. Open the Web page in the browser.
6. Right click the Web page and click **View Source**.
7. In the <head> tag, you see meta tags from the content block added to the page, as shown in the following image.



MetadataList

8.50 and higher

IMPORTANT: Starting from release 8.6, the MetadataList server control was replaced by the FrameworkUI: <ektron:ContentView> templated server control. If you are already using the MetadataList server control, you can continue to do so, but Ektron recommends using current versions of functionality.

The MetadataList server control creates lists based on Keyword Names and Keyword Values contained within content metadata. The list can display the information as a list of hyperlinks. You can choose, based on properties you set, to display the summary and how to order the display. See also: Working with Metadata.

NOTE: On a PageBuilder page, you can insert a metadata list using the MetaDataList widget. See also: Creating and Using Widgets.

Inserting the MetadataList server control onto a page

PREREQUISITE

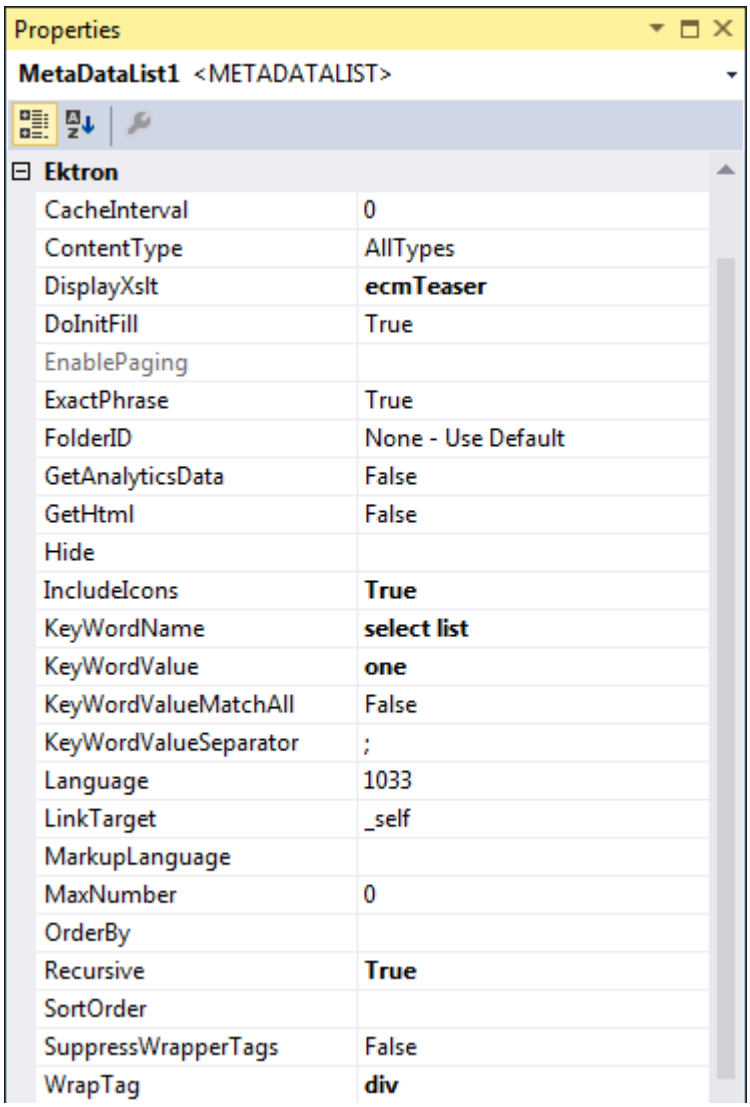
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **MetadataList** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:MetadataList ID="MetadataList1" runat="server" />
```

4. Click on `MetadataList` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



MetadataList properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

  IMPORTANT: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **ContentType** (Ektron.Cms.Controls.CmsWebService.CMSContentType)
  Select a type of content for this control. Choices are:
  - All Types
  - Content
  - Forms
  - Archive_Content
  - Archive_Forms
  - Assets
  - Archive_Assets
  - LibraryItem
  - Multimedia
  - Archive_Media
  - NonLibraryContent
  - DiscussionTopic
- **DisplayXslt** (String)
  Determines how the information on the page appears
  - **None**. Databind only
  - **ecmNavigation**. Lists the title of every content block in the folder.
  - **ecmTeaser**. Lists the title of every content block in the folder plus the content summary.
  - **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

  WARNING!
  If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **EnablePaging** (Boolean)

  This property, in conjunction with the **MaxNumber** property, lets site visitors view an unlimited number of items while controlling the amount of screen space. The **MaxNumber** property limits the number of items displayed. If you set this property to **True**, and the number of items exceeds **MaxNumber**, navigation aids appear below the last item, allowing the visitor to go to the next screen. See example below.

  So, for example, if specified metadata is found in 9 items and the `MaxResults` property is set to 3, the screen displays only the first 3 items. When the site visitor clicks **[Next]**, the visitor sees items 4, 5 and 6.

  NOTE: If the `EnablePaging` property is set to True, the `CacheInterval` property is disabled.

- **ExactPhrase** (Boolean)

  Determines whether the KeyWordValue needs to match the metadata value exactly. For example, if "site" is the KeyWordValue, the title of a content block is "Welcome to the site" and ExactPhrase is set to **True**, you would not see the content block in the metadata list. This is because "site" does not equal "Welcome to the site".

  - **True**. Match exact phrase
  - **False**. Doesn't need to match exact phrase

- **FolderID**

  The folder ID from which content is retrieved. At the `Recursive` property, you determine if content in this folder's subfolders is also retrieved.

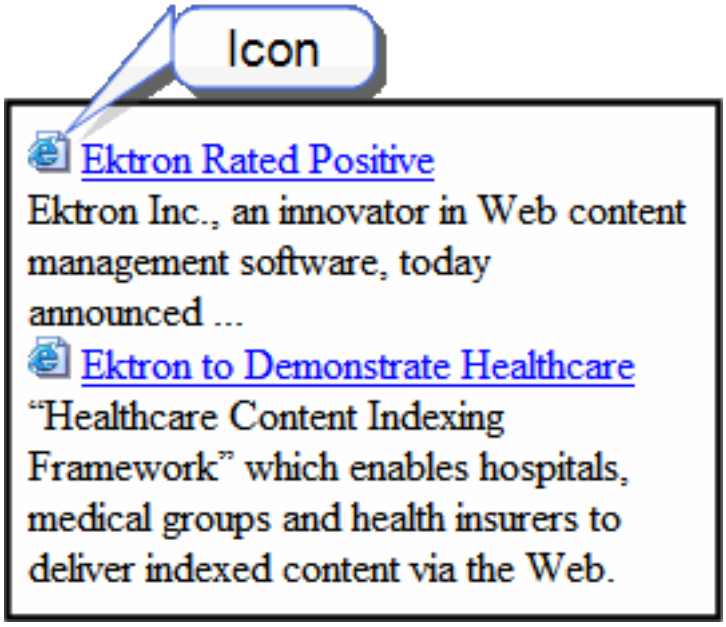
- **GetAnalyticsData** (Boolean)

  Set this property to **True** if you want the following information for each content in the list. Returns **Content View Count**, **Content Rating**, **Content Rating Average**. Create your own XSLT styles to display this data.

  IMPORTANT: This property provides reliable data only when the Business Analytics Feature is on. See Running Ektron Business Analytics.

- **GetHtml** (Boolean)
  Set to **True** if you want to display the content (html body) for all content to appear on this metadata list. For example, you want to display content inside a Web server control such as a GridView.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IncludeIcons** (Boolean)
  Choose whether to display icons next to the metadata list's links.

  NOTE: This property only works when ecmSummary or ecmTeaser are used in the `DisplayXslt` property. When the `[$ImageIcon]` variable is used in an EkML file and that file is assigned to the `MarkupLanguage` property, this property acts as True.



- **KeyWordName** (String)
  KeyWordName represents a metadata definition, that is, the container for the KeyWordValues. Examples of a KeyWordName are **Keywords** and **Title**. If you are authenticated, you can click the ellipsis button and select from a list of existing metadata definitions. For information on creating metadata definitions, see Adding a Metadata Definition.
- **KeyWordValue** (String)
  Enter the values associated with the KeyWordName. Only content whose metadata (defined at the `KeyWordName` property) matches this value appears on the metadata list. Examples of a KeyWordValue are "home; page; company."

NOTE: The character that separates multiple items is defined at the `KeyWordValueSeparator` property. At the `KeyWordValueMatchAll` property, you determine if all metadata definition values must match or any one of them.

- **KeyWordValue MatchAll** (Boolean)

  This property is only used if you enter more than one keyword value. If you do, and only want content to appear on the metadata list if *all* values entered at the KeyWordValue field match their metadata values, enter **True**. If metadata can appear on the list as long as *any value* defined at the KeyWordValue field matches the selected metadata value for a content item, enter **False**.

  Example:

  KeyWordValue for **Title** (assigned for this server control): home; page; company. Metadata values for a content item's **Title** metadata definition field: software; ektron; company.

  - If `KeyWordValueMatchAll =true`, content does not appear on metadata list because some items do not match.
  - If `KeyWordValueMatchAll = false`, content item appears on metadata list because one item (company) matches.

- **KeyWordValueSeparator** (String)

  Enter the character used to separate the list of keyword values. An example is a semicolon(;).

- **Language** (Integer)

  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (ItemLinkTargets)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MarkupLanguage** (String)

  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.See also: *Ektron Markup Language* on page 2633

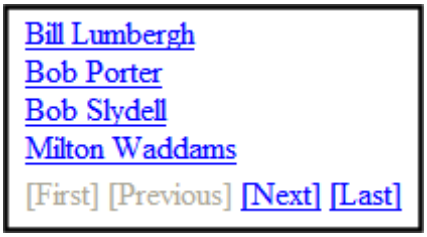
  See also: *metadatalist.ekml* on page 2640

NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.

- **MaxNumber** (Integer)

  Enter the maximum number of items to appear in the initial display of this server control. To set no maximum, enter zero (0). To let site visitors view more than the maximum but limit the amount of space being occupied, enter the maximum number of results per page here. Then, set the `EnablePaging` property to **true**.

  If you do and more than the number of `MaxResults` are available, navigation aids appear below the last item to help the site visitor view additional items. See example below.

- **OrderBy** (Ektron.Cms.Controls.CmsWebService.ContentOrderBy)

  The order of the list to be returned.

  - **Title**. The title of the content block
  - **ID**. The content block ID
  - **Date Created**. The date the content block was created
  - **Date Modified**. The date the content block was last modified
  - **LastEditorLname**. The last editor's last name
  - **LastEditorFname**. The last editor's first name
  - **ContentRatingAverage**. Business Analytics Content Rating
  - **ContentViewCount**. Business Analytics Content Views

- **Recursive** (Boolean)

  Whether to search sub-folders of the identified root folder. The starting folder is identified in the `FolderID` property.

- **SortOrder** (String)

  Choose the order direction of the list, Ascending or Descending.

- **SuppressWrapperTags** (Boolean)

  This property is set to `false` because Ajax uses `<div>` tags to rewrite the region around the tag. You *cannot* change the value to `true`.

- **WrapTag** (String)

  Lets a developer specify a server control's tag.

  - **Span** (default). Designate an inline portion of an HTML document as a span element.

- **Div**. Apply attributes to a block of code.
- **Custom**. Lets you use a custom tag.

Retrieving the XML structure of a MetadataList

Retrieving the XML structure of XML content allows for greater control over developing XSLs. The following is an example of how to retrieve the XML structure.

1. Open a new Web form.
2. Drag and drop a MetadataList server control onto it.
3. Set the `KeyWordName` and `KeyWordValue` properties.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to **MultiLine**.

   NOTE: Set the text box width to at least 400px.

6. On the code-behind page, add the following line.

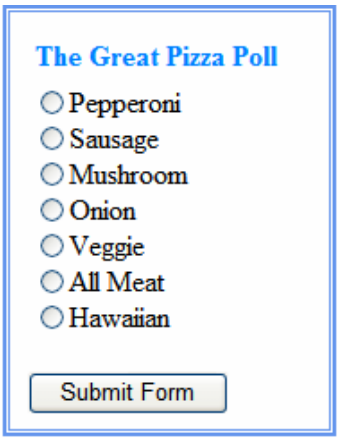
   ```
   Textbox1.Text = Metadata1.XmlDoc.InnerXml
   ```

7. Build the project.
8. View the Web form in a browser.
9. The XML structure of the MetadataList appears in the textbox.

Poll

8.50 and higher

The Poll server control displays a poll or survey created from an Ektron form on a Web page. When added to a template and visited, the poll might look like this. You can change a poll's appearance by modifying its properties.



You should display a poll or survey with a Poll server control, because it provides great flexibility with the poll's appearance. Typically, developers want a poll or survey in a small section of a Web page, not the main content. By using the

`EnableAjax` property, you can display the results in the same area as the poll or survey without refreshing the entire page.

However, if you want the form/poll/survey's response to be either **Redirect to a file or page** or **Redirect form data to an action page**, you must use a Form Block server control to display the form on a Web page. See also: *FormBlock* on page 2433.

Inserting the Poll server control onto a page

PREREQUISITE

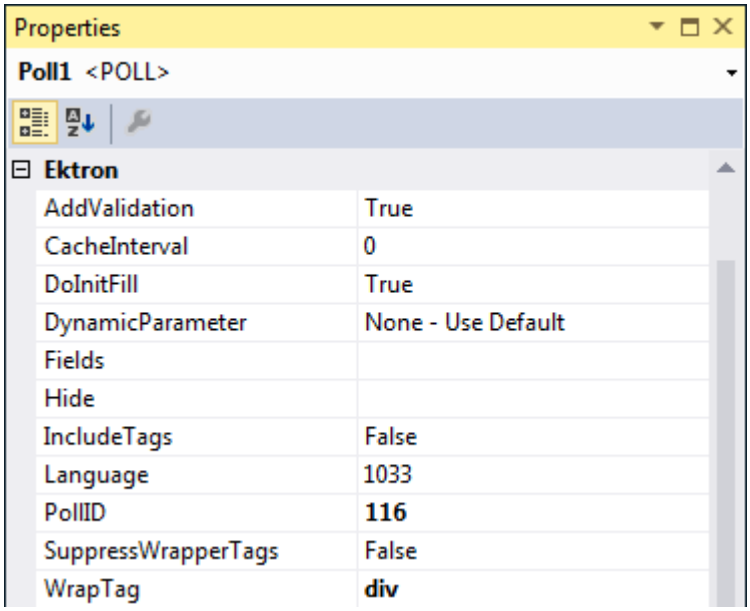
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **Poll** server control and drop it into the desired location on the page.

NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:Poll ID="Poll1" runat="server" />
```

4. Click on `Poll` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



Poll properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AddValidation** (Boolean)
  The AddValidation property is obsolete and ignored. It has no effect. It is always true.
- **CacheInterval** (Double)
  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  To make this form block dynamic, select **ekfrm**. When you do, this server control uses the form block passed as a URL parameter.
- **Fields** (FormFieldCollection)
  Displays a list of fields that are defined in the form. These fields are read only. This is an excellent way of displaying the field names used on the form. With this list of names, you can create events using the fields without having to enter the Workarea to see the names.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **IncludeTags** (Boolean)
  Determines if tags are generated automatically or manually.
  - Let Ektron generate form tags automatically if you are developing a pure .aspx page script. To enable this option, set `IncludeTags` property to **True**.
  - Modify HTML form tags in the .aspx file if you are developing an .aspx page and associated code-behind Web form. To enable this option, set `IncludeTags` property to **False**. Here is the default .NET generated form tag:

    ```
    <form id="Form1" method="post" runat="server">
    ```

    Modify the form tag as indicated in red:

    ```
    <form id="Form1" method="post" runat="server"
      OnSubmit="return EkFmValidate(this);">
    ```
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).

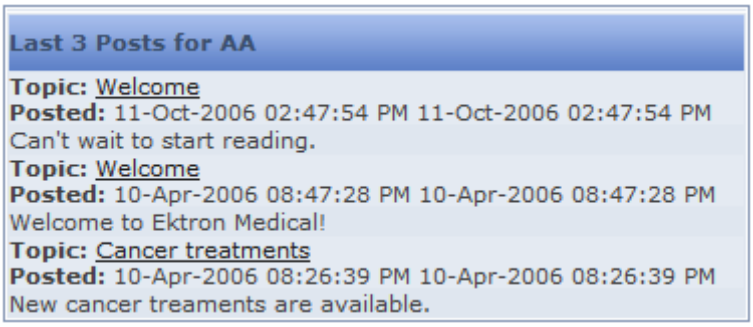
- **PollID** (Long)
  The ID of the poll that appears where you inserted this server control. If you don't know the ID number of the pol, use the CMS Explorer to browse to it.See also: *Browsing your Ektron site using CMS Explorer* on page 2147
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

PostHistory

8.60 and higher

The PostHistory server control displays a list of forum posts for a given user. The posts are displayed in order, by date, and contain the following:

- **Topic**. The topic that contains the post
- **Posted**. The date the post was created
- **Content**. The post's content



Inserting the PostHistory server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

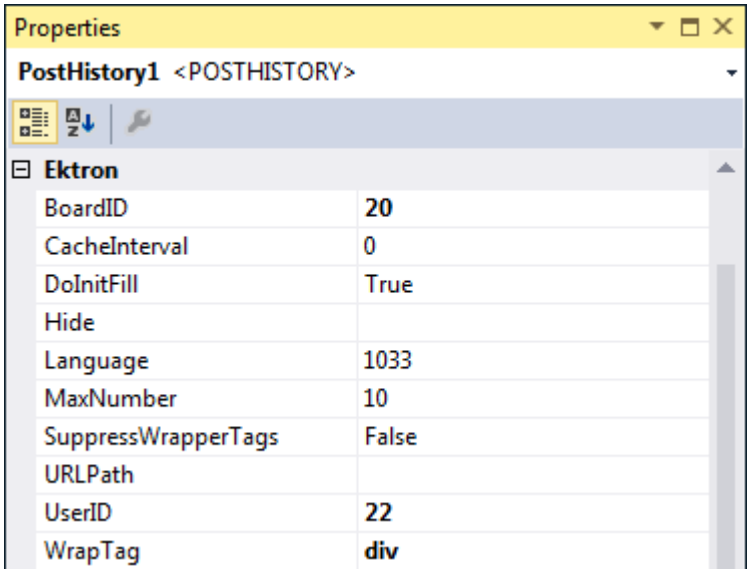
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.

3. Drag the **PostHistory** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:PostHistory ID="PostHistory1" runat="server" />
```

4. Click on `PostHistory` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



PostHistory properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **BoardID** (Long)

  The ID of the discussion board from which to get a user's posts. If you don't know the ID, click **Ellipses** (...), then sign in, browse to and select the discussion board.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MaxNumber** (Integer)
  The maximum number of posts listed. The default is **10**.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **URLPath** (String)
  The URL path to the page that hosts the Forum server control.
- **UserID** (Long)
  The ID of the user for whom to get the post history.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

RssAggregator

8.50 and higher

An RSS aggregator consumes an RSS feed and displays its information in a readable format. The RssAggregator server control lets you do the same by processing and displaying an RSS feed from any website. This lets you create an information Web page for news, stories, images, lists of music, and so on.

You can create a multi-level information Web page by placing several RssAggregator server controls on a page. For example, create a world news Web page by adding RSS feeds from the NY Times, BBC, and AFP (Agence France-Presse). To add an RSS Aggregator to your website:

1. Drag and drop the RssAggregator server control a Web form.
2. Set the `URL` property to point at the RSS feed. For example, `http://msdn.example.com/rss.xml`

When a site visitor views the Web form, the RSS feed displays properly. If the visitor refreshes the page, information updated by the RSS feed provider appears.

To change an RSS feed's appearance, create a custom XSLT.

Inserting the RssAggregator server control onto a page

PREREQUISITE

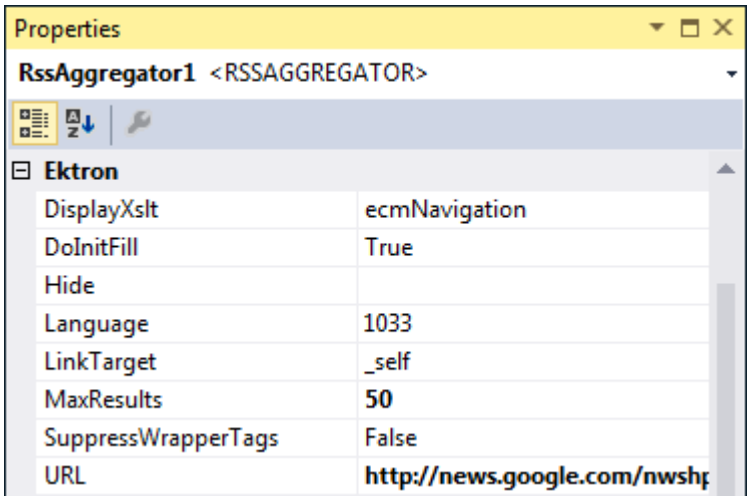
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **RssAggregator** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:RssAggregator ID="RssAggregator1" runat="server" />
   ```

4. Click on `RssAggregator` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



RSS Aggregator properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **DisplayXslt** (String)
  Determines how the information on the page appears.

- **None**. Databind only.
- **ecmNavigation**. Lists the title of every RSS feed item.
- **ecmTeaser**. Lists a title and a description of every RSS feed item.
- **Path to Custom Xslt**. If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file, create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)

  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.

- **Hide** (Boolean)

  Hides or displays the output of the control in design time and run time.

  - **True**. Hide the control output.
  - **False**. Display the control output.

- **Language** (Integer)

  Set a language for viewing the RssAggregator. This property shows results in design-time (in Visual Studio) and at run-time (in a browser).

- **LinkTarget** (ItemLinkTarget)

  Determines the type of window that appears when you click a link in the server control.

  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.

- **MaxResults** (Integer)

  The Maximum number of items from an RSS feed that are returned. 0 (zero) = unlimited.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **URL** (String)

  The RSS feed path for the server control. For example:
  `http://msdn.example.com/rss.xml`

Retrieving the XML structure of an RssAggregator

Retrieving the XML structure of XML content allows for greater control over developing XSLs. To retrieve the XML structure:

1. Open a new Web form.
2. Drag and drop a RssAggregator server control onto it.
3. Set the `URL` property.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to **MultiLine**.

   NOTE: You should set the text box width to at least 400px.

6. Add the following line on the code-behind page.

   ```
   Textbox1.Text. RssAggregator1.XmlDoc.InnerXml
   ```

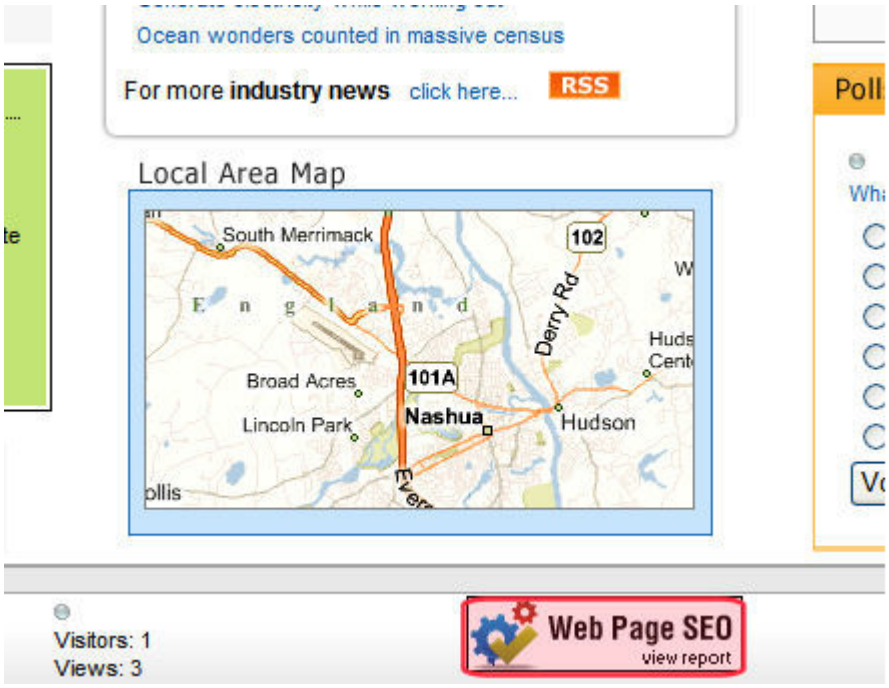
7. Build the project.
8. View the Web form in a browser. The XML structure of the RssAggregator Menu appears in the textbox.

SEO (search engine optimization)

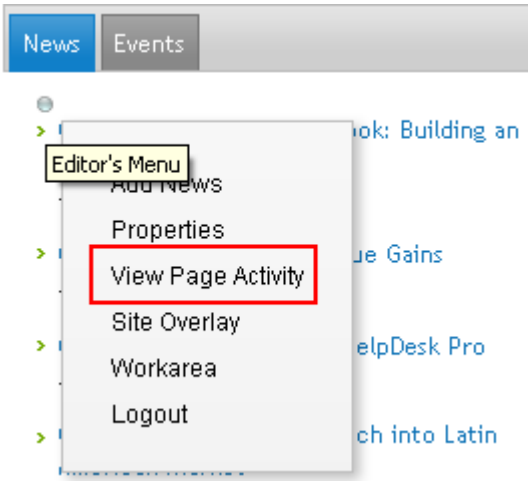
8.60 and higher

The SEO server control analyzes your website for W3C compliance, what information Google has about the page, Alexa rankings, image alt text, keyword density, and metadata. SEO lets you know how (and if) you have set these values.

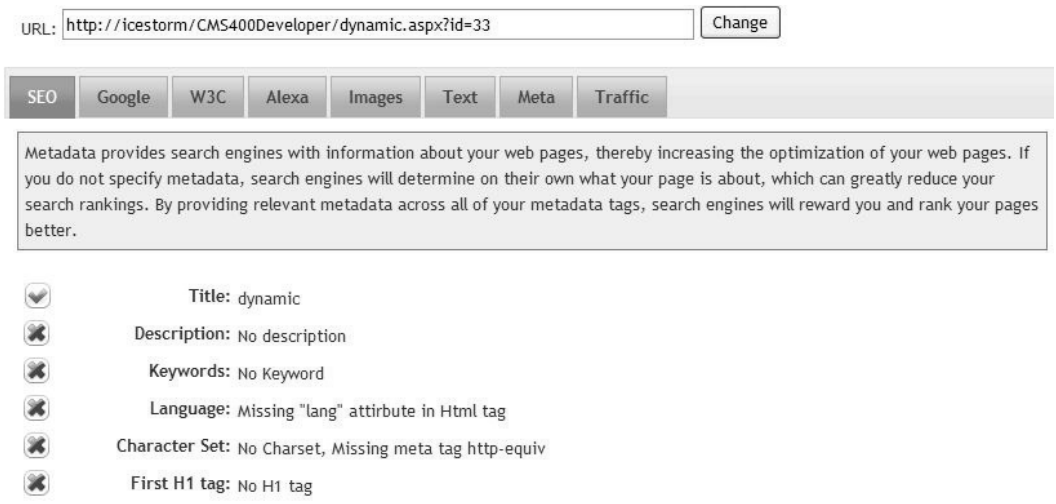
The Search Engine Optimization (SEO) control appears as an image on any template or master page on which you drop it.



You also can access the SEO report by clicking the Web Site Content menu then choosing **View Page Activity**.

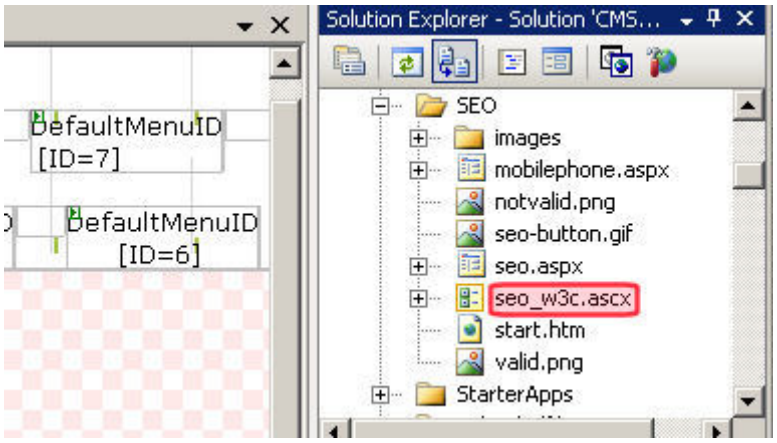


When you are logged in and click the image, you see a detailed report of how search engines evaluate the page. For example, the report runs the page through a W3C validation site, or displays how search engines evaluate the page's text.



Inserting SEO in a website

1. Within Visual Studio, open your website.
2. Open a master page or template on which to place the SEO control.
3. Open Solution Explorer, and your website within it.
4. Open the Workarea then the SEO folder.
5. Drag the SEO control (`seo_w3c.ascx`) onto an area of the page.



6. Save the page.

Viewing a Web page's SEO report

Only logged-in Ektron or Membership users can see the SEO control.The following list summarizes the information on the SEO Report.

- **SEO**. Compares viewed page against a basic SEO checklist, such as if keywords are included, language and charset values, and so on.
- **Google**. Information that search engines have about your page, including pages that link to it, indexed pages on the site and what the page looks like on a mobile device.

- **W3C**. Validates Web page for markup and CSS compliance, and also checks for broken links and the ability of the page to be displayed on mobile devices. By having correct markup that conforms to HTML or XHTML standards, search engines will detect words and phrases correctly, a key element in SEO. Correct markup also ensures that search engine spiders can easily understand the content and navigation on the page. Proper code will make it easier for spiders to parse as expected and digest the content for organic search engines.
- **Alexa**. Alexa is a leader in providing insight on the overall ranking of your website on the Internet. Alexa overview, traffic, related and linked-to sites.
- **Images**. To ensure SEO and compliance, all images on your pages should contain alt tags. This enables searching of the images (since engines cannot read the contents of an image). In addition, alt tags must be used for 508 compliance. This tab identifies all images and their alt tags.
- **Text**. A keyword density analysis report displays text graphically in much the same way that organic search engines see your page. Web pages that are content rich typically yield higher search engine rankings than pages that are mainly images or multimedia based. This report displays words, two-word phrases and 3-word phrases in a cloud format, revealing words and phrases that show up most often on the page. This information helps you to optimize your content and reach your target audience.

- **Meta**. The page's metadata
- **Misc**. Additional search information

SiteMap

8.50 and higher

The Sitemap server control utilizes the folder breadcrumb information in the Workarea to display a sitemap of your site. By choosing the starting point of the sitemap, the max levels to display and applying a style class, you can customize the sitemap. The sitemap appears as indented list when viewed on a Web page.

The contents of the sitemap are defined on the **Breadcrumb** tab, located in the Workarea folder properties. See also: *BreadCrumb* on page 2196.

This section also contains the following topics.

Inserting the SiteMap server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

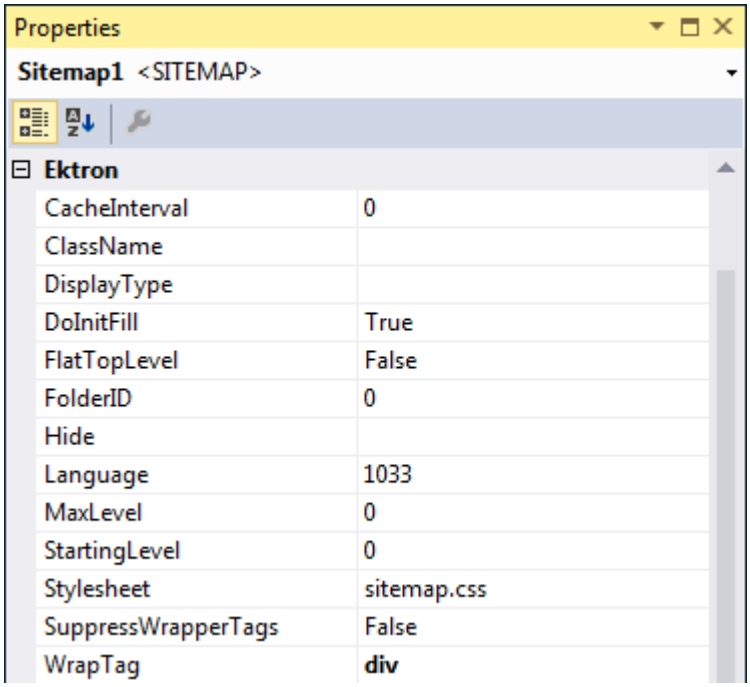
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **SiteMap** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:SiteMap ID="SiteMap1" runat="server" />
   ```

4. Click on `SiteMap` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the

property values.



Sitemap properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **CacheInterval** (Double)

  The number of seconds that a server control's data is cached. The default is 0 (zero). For example, if you want to cache the data for 5 minutes, set to 300. See also: *Caching with server controls* on page 2158.

- **ClassName** (String)

  The style sheet class name used to format the HTML. Leave blank to use the default. To use a new class, add it to `siteroot\Workarea\csslib\sitemap.css`. Then, add the class name to the property.

  IMPORTANT: Files stored in the *siteroot*`\Workarea` folder are overwritten (or deleted) when you upgrade. To avoid problems, back up the files to a folder outside the `siteroot\Workarea` folder.

- **DisplayXslt** (String) (Code-behind only)

  If desired, enter a relative or absolute path to an Xslt that determines the display of the page.

  WARNING! Files stored in the `siteroot\Workarea` folder are overwritten (or deleted) when you upgrade Ektron. To avoid problems, copy the default file to a folder outside the `siteroot\workarea` folder then edit it. If there is no default file,

create the file outside the `siteroot\workarea` folder. Next, in this property, enter the path to that file relative to the site root folder.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **FlatTopLevel** (Boolean)
  When set to **True**, include site nodes from the parent folder but not their items. Set to **False** to include all nodes and items.
- **FolderID** (Long)
  The folder ID for the starting point of the site map. To choose the root folder, enter 0 (zero).
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **MaxLevel** (Integer)
  Set the maximum amount of levels to show. 0 (zero) = unlimited.
- **StartingLevel** (Integer)
  Set to the starting level of the site map. If set to 0 (zero), starts from the root.
- **Stylesheet** (String)
  Specify the path to a style sheet for use with this server control. Leave blank to use the default style sheet. To use a custom style sheet, place it in a folder outside the `siteroot\workarea` folder then edit it. Next, in this property, enter the path to the custom style sheet relative to the site root folder.
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Using Sitemap

NOTE: Make sure you have added the sitemap information to your folders' Breadcrumb tab in the Workarea.

To use the Sitemap server control:

1. Open a Web form for which you want to create a sitemap.
2. Drag and drop the Sitemap server control onto an appropriate location of the Web form.
3. Add the starting folder's ID to the `FolderID` property.
4. Set other properties. See also: *Sitemap properties* on page 2523.
5. Save the Web form.
6. Open a browser.
7. View a Web page with the Sitemap server control in it. The sitemap now appears on your site.

Retrieving the XML structure of a site map

Retrieving the XML structure of XML content allows for greater control over developing XSLs. The following is an example of how to retrieve the XML structure:

1. Open a new Web form.
2. Drag and drop a SiteMap server control onto it.
3. Set the `FolderID` property.
4. Drag and drop a textbox on the Web form.
5. Set the `TextMode` property to **MultiLine**.

   NOTE: It is also recommended that you set the width of the text box to at least 400px.

6. On the code-behind page, add the following line.
7. `Textbox1.Text = SiteMap1.XmlDoc.InnerXml`
8. Build the project.

9. View the Web form in a browser. The XML structure of the Site Map appears in the text box.

WebCalendar

8.50 and higher

The WebCalendar server control displays Ektron calendars. See also: Working with Calendars.

NOTE: On a PageBuilder page, use the Calendar widget to insert a calendar.

The following code example shows the WebCalendar server control.

```
<cms:WebCalendar ID="webcalendar" runat="server"
 DynamicParameter="calendar_id" DisplayType="Day">
     <DataSource>
   <cms:CalendarDataSource defaultId="724"sourceType="SystemCalendar"/>
 </DataSource>
</cms:WebCalendar>
```

The following list shows properties set inside the `<DataSource> <CalendarDataSource>` tag.

- **backColor** (String)
  The background color of the calendar event. If you set this value to `AutoSelect`, the next available color in the list is chosen automatically.
- **defaultId** (String)
  The Id of the SystemCalendar, GroupCalendar or UserCalendar to display on the Web page. For more information about using this property, see Combining Web Calendars (Mashups).
- **queryParam** (String)
  The parameter that may be in the query string to mash-up additional calendars. This can be any Calendar SourceType. For example, if the value is set to **uid,** then the querystring can be:

  `.../calendar.aspx?calendar_id=”55”&uid=”440”`

  For more information about using this property, see Combining Web Calendars (Mashups).
- **sourceType** (String)
  Choices are **SystemCalendar, GroupCalendar, UserCalendar**. See also: Combining Web Calendars (Mashups)

  NOTE: The CategoryID property set inside the `<DataSource> <CategoryID>` tag is used to identify taxonomy categories to filter calendar events.

Inserting the WebCalendar server control onto a page

PREREQUISITE

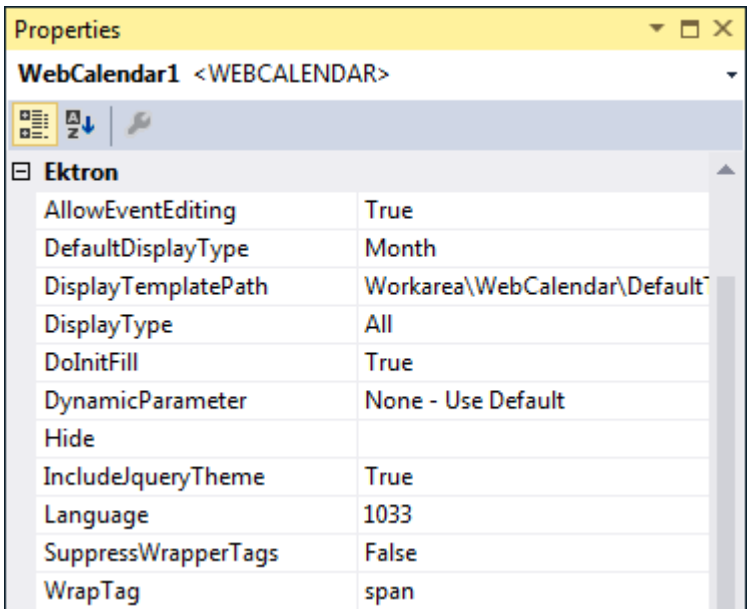
You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **WebCalendar** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

```
<CMS:WebCalendar ID="WebCalendar1" runat="server"></CMS:WebCalendar>
```

4. Click on `WebCalendar` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify the property values.



WebCalendar properties

The following are Ektron-specific server control properties. For information about native .NET properties such as font, height, width and border style, use Visual Studio® help.

- **AllowEventEditing** (Boolean)

  Determines whether users can add or edit calendar events. Default is **True**.

- **DefaultDisplayType** (String)

  Specify the default calendar display. The default is **Month**, which means that the month view appears on the Web page. The site visitor can change the view.

- **DisplayTemplatePath** (String)

  Specify the path to the code that controls how events are displayed. Default is blank.

- **DisplayType** (String)
  Determines which time periods appear on the calendar. Choices are **All**, **Day**, **Month**, **Week**. Default is **All**.
- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicParameter** (String)
  To make this calendar dynamic, select **calendar_id**. When you do, this server control uses the calendar passed as a URL parameter. To exclude this function, choose **None- Use Default**. Only Calendars with `sourcetype=SystemCalendar` may be used in the querystring for this value. For example, where `DyanamicParameter="calendar_id"`, the URL may read `http://mysite.com/calendar.aspx?calendar_id="55"`. In this case, calendar 55 must be of the SystemCalendar type.
- **Hide** (Boolean)
  Hides or displays the output of the control in design time and run time.
  - **True**. Hide the control output.
  - **False**. Display the control output.
- **Language** (Integer)
  Set a language for viewing content; shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **SuppressWrapperTags** (Boolean)
  Suppresses the output of the span/div tags around the control.
  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

WebSearch

IMPORTANT: Deprecated. The WebSearch server control is deprecated as of Release 8.50. Instead of the WebSearch control, you should convert to using templated search. If you are already using the WebSearch server control, you can continue to do so with one important exception: the Solr search provider is incompatible with the WebSearch server control.

The Web Search server control lets you customize the behavior of search. You place this control on any Web form from which a site visitor can search your site. For more information about the site visitor experience, see Setting Up Search for Your Website.

For new pages, developers are encouraged to replace the Web Search server control with Templated Search server controls. See also: *Templated server controls* on page 2045.

Inserting the WebSearch server control onto a page

PREREQUISITE

You must have installed the server controls. See *Installing server controls into Visual Studio Toolbox* on page 2135.

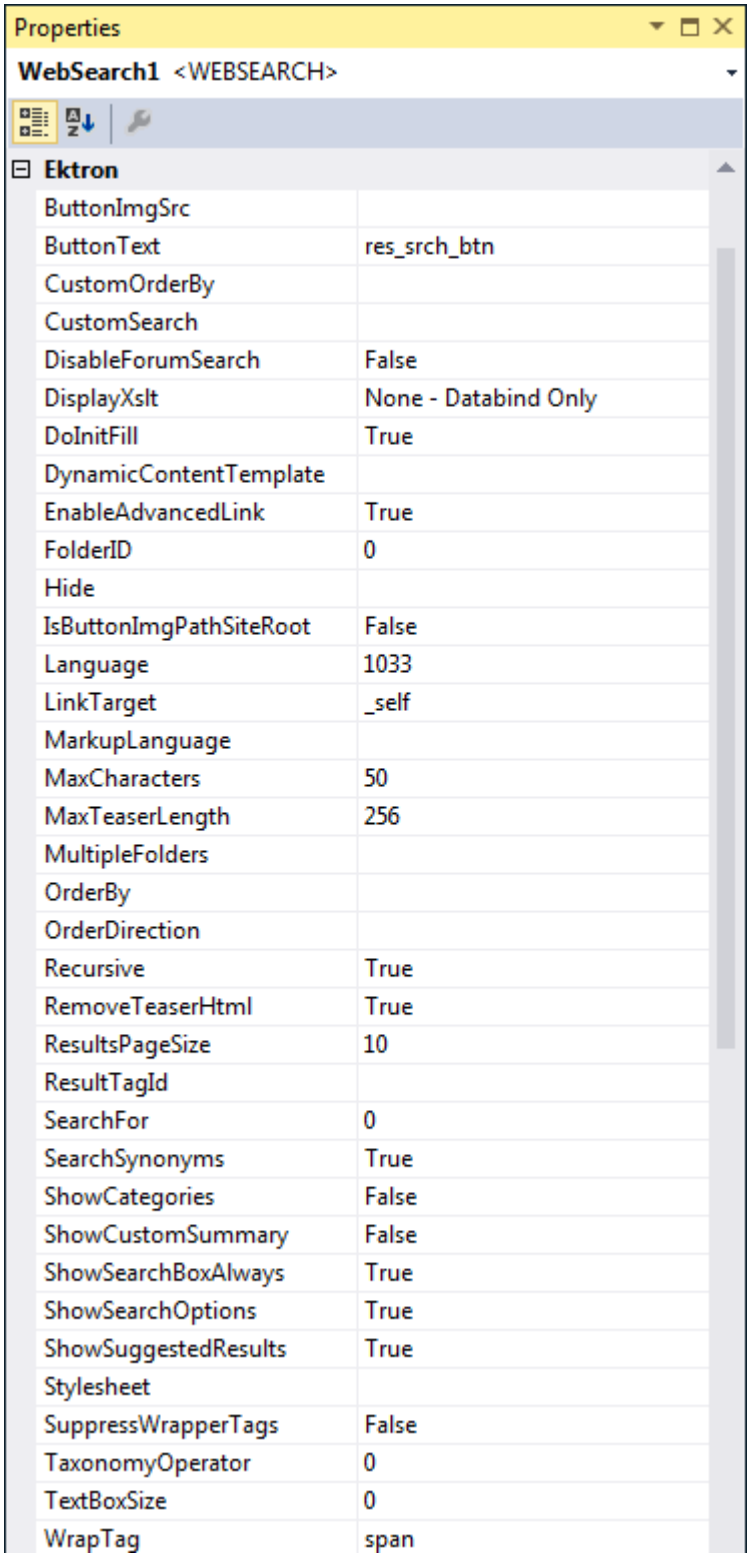
1. In Visual Studio, choose **View > Toolbox**.
2. Click the **Ektron server control** tab to display the server controls.
3. Drag the **WebSearch** server control and drop it into the desired location on the page.

   NOTE: You also can place the cursor on the page where you want the server control, then double click the server control that you want.

   ```
   <CMS:WebSearch ID="WebSearch1" runat="server" />
   ```

4. Click on `WebSearch` in the code to display and modify the control's properties using the Properties window of Visual Studio. The page is updated as you modify

the property values.



WebSearch properties

The following table describes the Web Search server control properties.

- **ButtonImgSrc**(String)

  If you want to display an image on the submit button, enter the server path to the image.

- **ButtonText**(String)

  The button text if no image source is identified in the `ButtonImgSrc` property. If an image source is identified, this is alternate text for the button.

- **CustomOrderBy**(String)

  Provide a property's Friendly Name defined in the Indexing Service to sort search results by that property. For example, if you define DocAuthor, results are sorted by the document's author. A property's Friendly Name can be found in **Computer Management > Services and Applications > Indexing Service > Your Index > Properties > Friendly Name** column.

  Results can be ascending or descending based on `OrderDirection`. If you enter an invalid property, no search results are returned.

  If you specify `CustomOrderBy` and `OrderBy`, the `OrderBy` property is ignored.

- **CustomSearch**(String)

  If you want the search to include folders outside of Ektron, enter the folder names here. Separate multiple items with a comma. You do not need to enter the folder path, but it must reside within the site root folder.

- **DisableForumSearch**(Boolean)

  Set to true if you want to remove Forums from the list of content types that appears on the Search server control. The default value is false. Regardless of this setting, if a user selects **Site** from the list, forum posts are searched.

- **DisplayXslt**(String)

  Determines the display of the search results page.

  - **None**. Databind only
  - **ecmNavigation**. Lists the title of every content item found by the search
  - **ecmTeaser**. Lists the title and summary of every content item found by the search
  - **ecmUnOrderedList**. Sorts in no particular order. Shows the title and content summary.
  - **Path to Custom Xslt**. Enter the path to an Xslt that determines the display of the page.

    WARNING! If you specify an external Xslt file, it is strongly recommended that you do not store this file in your site's Workarea folder. If you store this file in the Workarea folder, the file will be lost when you upgrade.

    WARNING! If you enter a valid EkML file at the MarkupLanguage property, this property value is ignored.

- **DoInitFill** (Boolean)
  By default, Fill occurs during the Page_Init event. Set to **false** if you want to postpone the fill-action until later. In this case, Fill is automatically called during the Page Render event. You might do this if you need to set or change a property on the control in code-behind and have it render with your changes shown.
- **DynamicContentTemplate**(String)
  Sets the template for dynamic content. This property overrides any quicklink template for the content.
- **EnableAdvancedLink** (Boolean)
  Set to **true** to display an additional tab (**Advanced**) on the Search control.
- **FolderID**(String)
  The folder at which the search begins. The starting folder need not be the root folder. The `Recursive` property determines if the search examines this folder's subfolders.
- **Hide** (Boolean)
  Select **False** to display this server control on the page. Select **True** to suppress it.
- **IsButtonImagePathSiteRoot** (Boolean)
- **Language** (Integer)
  If the template on which this server control resides includes a language selection control, and you want to let the site visitor select the language, enter zero (0). Otherwise, click the field, then the ellipsis button and a popup box appears. Select a language from the list.

  This property shows results in design-time (in Visual Studio) and at run-time (in a browser).
- **LinkTarget** (String)
  Determines the type of window that appears when you click a link in the server control.
  - **_Self** (default). Opens in same window.
  - **_Top**. Opens in parent window.
  - **_Blank**. Opens in new window.
  - **_Parent**. Opens in the parent frame.
- **MarkupLanguage** (String)
  Enter the template markup file (`.ekml`) that controls the display of this server control. To use the default .ekml file, leave this field blank.

  The default file follows this pattern: `\siteroot\Workarea\template\this object\objectname.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in this property, enter the path to that file relative to the site root folder.

See also: *Ektron Markup Language* on page 2633

NOTE: If you enter a valid EkML file at the **MarkupLanguage** property, the **Displayxslt** property value is ignored. If the EkML file contains the `[$ImageIcon]` variable, the `IncludeIcons` property acts as True.

- **MaxCharacters** (Integer)

  The maximum number of characters the Search text box accepts. If you enter less than 50, set the `TextBoxSize` property to the same number.

- **MaxTeaserLength** (Integer)

  Limits the length of any returned content's abstract. To allow unlimited length, set to zero (0). This property is active only if both of these conditions are true.

  - You use the `DisplayXslt` property to identify an xslt and ecmteaser as a value of that property. If you enter an .ekml file at the MarkupLanguage property, this value is ignored.
  - the `ShowCustomSummary` property is set to `false`. If it is set to `true`, the entire summary appears in search results.

- **OrderBy** (String)

  The field that determines the sorting of search results.

  NOTE: The `Order Direction` field determines the direction of the search results. For example, if you sort by ID and `Order Direction` is set to **Descending**, the results sort by ContentID with the highest ID number at the top of the list.

  - Title. The content title (alphabetical)
  - ID. The content ID number
  - Date Created. The date the content was created
  - Date Modified. The date the content was most recently modified
  - Editor. The user who last edited the content (alphabetical)
  - Rank. The content's rank.

- **OrderDirection** (String)

  The direction in which search results are sorted. The default is Ascending.

  - **Ascending**. Alphabetical results from A to Z; numeric values low to high; dates from oldest to most recent
  - **Descending**. Alphabetical results from Z to A; numeric values high to low; dates from most recent to oldest

- **Recursive** (Boolean)

  Determines whether to search sub-folders of the starting folder. The `FolderID` property determines the starting folder.

- **RemoveTeaserHTML** (Boolean)
  Set to true if you want to remove HTML tags from the content summary within search results.
- **ResultsPageSize** (Integer)
  Set the maximum number of search results on a page. If a search returns more than this many results, the following text appears below the last one:

  Result Page: 1 2 3 Next

  The user can click **Next** or a number to view additional results.

  This property defaults to the value set at the `ek_PageSize` element in the *siteroot*\`web.config` file.

  Property's Effect on Suggested Results

  Only the number of Suggested Results up to this maximum appear. If more than this number should display, they do not. This is unlike natural search results, whose additional links are available via numbers below the maximum page size.
- **ResultTagId** (String)
  Lets you designate where search results appear. You can place search criteria in one area of a Web form and results in another. For example, you have the following tag.

  ```
  <span id="results"></span>
  ```

  In this case, enter **results** for this property's value.
- **SearchFor** (String)
  Choose the type of content that may be searched via this control.
  - All
  - HTML
  - Documents
  - Images
  - Multimedia
  - Discussion Forums
  - Tags
  - eCommerce products
  - PageBuilder

  If the value is anything other than **All**, this server control only examines the selected content type.

  IMPORTANT: If this property is set to anything other than **All**, the search options drop-down does not appear.
- **SearchSynonyms** (Boolean)
  If set to true, the Synonym Search is included with the search. If false, Synonym Sets are ignored.

- **ShowCategories** (Boolean)

  If set to true, this server control displays a **Filter by Category** option, which helps a site visitor zero in on relevant content. If false, **Filter by Category** does not appear.

  IMPORTANT: In order for the **Filter by Category** option to appear, the `ShowSearchBoxAlways` property must be set to true.

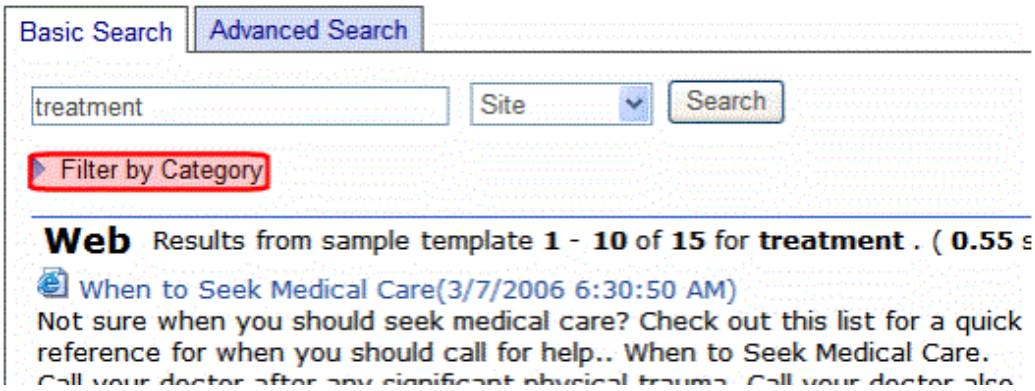
  The Taxonomy feature lets users assign information categories to content. For example, if your organization is a university, taxonomy categories might be Athletics, Alumni, Admissions, Academic Departments, and so on. As new content is created, users should apply relevant taxonomy categories to it. This enables a site visitor to search by category *and* search terms. For example, if the search term is calendar and the category is Athletics, the search would typically return calendars of sports teams but not other calendars, such as those for graduation, exams, or parent weekend.

  NOTE: This property depends on the assignment of taxonomy categories to content. If they are not, the filter hides relevant but unclassified content.
  For example, an author creates an article on "Treating Heart Disease" but doesn't assign a taxonomy category to it. If a site visitor on a search page selects **Filter by Category** then the **Medical Forum > Heart Disease** category, he will not find that article.

  A developer can control whether results must match *all* categories selected in the **Filter by Category** tree, or *at least one* category. To display results that must match all categories, set the `TaxonomyOperator` property to `And`. To show results that match one or more categories, set `TaxonomyOperator` to `Or`. By default, the property is set to `Or`, which provides a wider range of results.

  Effect of Setting ShowCategories to True

  If you set `ShowCategories` to true, initially the site visitor sees no difference. Upon entering a search term that exists in content to which a taxonomy category is assigned and clicking **Search**, **Filter by Category** appears above the results (illustrated below).



- **ShowCustomSummary** (Boolean)

  If set to **true**, the search results display the content item's summary. If false, the search results display the characterization. The default is false.

NOTE: If this property is set to true, the `MaxTeaserLength` property is ignored. So, the entire summary appears with search results, regardless of length.

- **ShowSearchBoxAlways** (Boolean)

  If set to true, the search box appears on the PostBack screen. If false, the search box does not appear on the PostBack screen. The default is true.

- **ShowSearchOptions** (Boolean)

  If set to true, the following drop-down appears to the right of the Search box.

  A site visitor can click an option to limit the search by content type. If the user accepts the default value, **Site**, all content types are searched.

WARNING! If the `SearchFor` property is set to anything other than **All**, the search options drop-down does not appear.

NOTE: If the `DisableForumSearch` property is set to true, **Forums** does not appear in the drop-down.

- **ShowSuggestedResults** (Boolean)

  If set to `true`, Suggested Results related to the search term appear. If `false`, Suggested Results do not appear.

NOTE: If the `ResultsPageSize` property value is less than the number of suggested results applied to a term or synonym set, only the property's number of results appears. For example, if you assign five links to a Suggested Result set but set `ResultsPageSize` to three, only the first three results appear.

- **Stylesheet** (String)

  If you want to define a style sheet for the search results page, specify its path relative to the site root folder. For example: `Workarea\csslib\mytest.css`. Leave blank to use the default style sheet, `webroot\Workarea\csslib\search.css`.

WARNING! If you enter a valid EkML file at the MarkupLanguage property, or a value at the DisplayXslt property, this property is ignored.

- **SuppressWrapperTags** (Boolean)

  Suppresses the output of the span/div tags around the control.

  - **True**. Suppress wrap tags.
  - **False** (default). Allow wrap tags.

- **TaxonomyOperator** (Enum-TaxCategoryOperator)
  Select whether to use an `And` or `Or` operator when filtering results by taxonomy. The default value is `Or`.
  - **And**. Only results that match all categories selected in the Filter by Category tree appear. For example, if a site visitor is searching for a medical document in the Hospital and Doctor's Office categories, only documents assigned to both categories appear.
  - **Or**. If more than one category is selected in the Filter by Category tree, results needs to only match one category to be shown.

  NOTE: For this property to be active, the `ShowCategories` property must be set to `true`.

- **TextBoxSize** (Integer)
  The size of the search text box for user input, in number of characters.
- **WrapTag** (String)
  Lets a developer specify a server control's tag.
  - **Span** (default). Designate an inline portion of an HTML document as a span element.
  - **Div**. Apply attributes to a block of code.
  - **Custom**. Lets you use a custom tag.

Property usage table

Web Search server control properties generally affect the control in 1 of 3 ways.

- **Search Display**. The server control's appearance on a Web page
  - ButtonImgSrc
  - ButtonText
  - DisableForumSearch
  - EnableAdvanced Link
  - Hide
  - Language
  - MaxCharacters
  - ShowSearchOptions
  - Text Box Size
  - WrapTag
- **Search Criteria**
  - CustomSearch
  - FolderID
  - Language
  - Recursive
  - SearchFor

- ShowCategories
- ShowSearchOptions
- ShowSuggested Results

- **Search Results Display**
  - CustomOrderBy
  - DynamicContentTemplate
  - DisplayXslt
  - Hide
  - Language
  - LinkTarget
  - MaxTeaserLength
  - OrderBy
  - OrderDirection
  - RemoveTeaserHtml
  - ResultsPageSize
  - ResultTagId
  - ShowCustomSummary
  - ShowSearchBoxAlways

IQueryable data sources for Ektron data types

9.20 and higher

This feature provides an IQueryable interface to interact with most core Ektron data types. *Linq support data classes* below provides a full list of supported data types and properties supported for querying.

The feature lets developers greatly simplify Framework API queries using expression trees or LINQ. For example:

```
var dataset = Ektron.Cms.Linq.EktronContext<Ektron.Cms.ContentData>.Source
                .Where(item => item.DateModified < DateTime.Now.AddMonths(-1) && item.FolderId == 30)
                .OrderBy(item => item.Title)
                .Skip(10)
                .Take(10);
```

Or the functionally equivalent:

```
var dataset2 = (from item in
Ektron.Cms.Linq.EktronContext<Ektron.Cms.ContentData>.Source
                where item.DateModified < DateTime.Now.AddMonths(-1) && item.FolderId == 30
                orderby item.Title
                select item);
```

While these calls are simpler to write, they still use the framework API to retrieve items underneath. So, they adhere to internal business logic, such as retrieving items to which the current user has permission. The calls also function with all predefined unity containers, such as WCF or Cache.

Available operators.

- Where - Within a **Where** predicate, the following operators are supported.
  - !
  - ==
  - !=
  - >
  - >=
  - <
  - <=
  - Contains
  - StartsWith
- OrderBy
- OrderByDescending
- Skip and
- Take

Linq support data classes

Linq support has the following data classes.

ActivityCommentData

PropertyName	WhereSupport	SortSupport

CMS strategies

IMPORTANT: In versions previous to 8.00, developers used the Plug-in Extension Wizard to extend the system. As of version 9.00, Ektron no longer raises plugin extension events. You *must* use extensible strategies and events to extend the CMS.

Developers can extend or modify the behavior of Ektron with software modules called *strategies*. The benefits of strategies include:

- You have full access to the Web application context, the HTTP context, the session information, data stored in cache, and APIs.
- You have more functionality available (such as the notification system) through API access.
- You can attach and set breakpoints in the same way you debug Web applications.
- Performance is improved because Web services are not required.
- Strategies run in the context of your Web application, so Windows Services are not required.

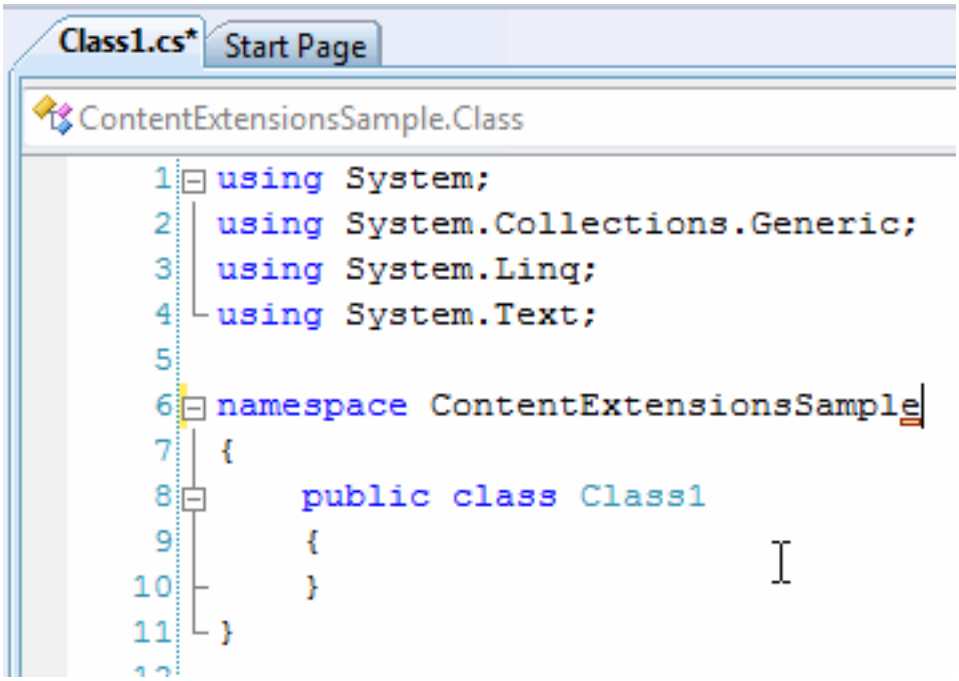
This section also contains the following topics.

Creating a CMS extension with Visual Studio

Creating a CMS extension with Visual Studio

1. In Visual Studio, open your website.
2. Add a new C# class to the `App_Code` directory.

3. The `Class1.cs` code page appears in the editor.



4. Add references to the following assemblies if they are not already added.

```
Ektron.CMS.Common
Ektron.CMS.Contracts
Ektron.CMS.ObjectFactory
```

   If the assemblies are not installed in Visual Studio, you can find them in the *siteroot*`/bin` directory.

5. Add the following `using` statements to the top of the class.

```
using Ektron.Cms;
using Ektron.Cms.Common;
using Ektron.Cms.Extensibility;
using Ektron.Cms.Extensibility.Content;
```

6. Update the class to extend `Ektron.Cms.Extensibility.ContentStrategy`.

```
namespace Cms.Extensions.Samples { public class ContentExtensionsSample :
ContentStrategy { } }
```

   NOTE: The namespace in this code is Cms.Extensions.Samples.

7. Override the method for the event you want to catch; in this example, `override OnBeforeAddContent()`. The code to modify the Title is as follows.

```
public override void
  OnBeforeAddContent(ContentData contentData, CmsEventArgs eventArgs)
  { contentData.Title += " modified"; }
```

The final code is as follows:

```
using System;
using System.Collections.Generic;
using System.Text;
using Ektron.Cms;
using Ektron.Cms.Common;
```

```
using Ektron.Cms.Extensibility;
using Ektron.Cms.Extensibility.Content;
namespace Cms.Extensions.Samples
{
public class ContentExtensionsSample : ContentStrategy
  { public override void
    OnBeforeAddContent(ContentData contentData, CmsEventArgs eventArgs)
    { contentData.Title += " modified"; }
  }
}
```

NOTE: More examples of extensions are found in the Ektron SDK folder. The default location for this folder is `Program Files\Ektron\CMS400SDK\CMS Extensions`. Also, sample eCommerce extensions are found in `Program Files\Ektron\CMS400SDK\Commerce\Events`.

Registering a strategy in the ObjectFactory

After creating an extension, register it in the `<webroot>/ObjectFactory.config` file. This file already contains `GoogleGeoCoder` objectStrategies, so you need to add a new Name in the Content area. In this example, the code looks like this.

```
<objectFactory>
  <objectStrategies>
    <add name="Content">
      <strategies>
        <add name="MyFirstExample"
          type="Cms.Extensions.Samples.ContentExtensionsSample"/>
        <add name="GoogleGeoCoder"
          type="Cms.Extensions.GoogleGeoCoder.ContentStrategy"/>
      </strategies>
    </add>
    <add name="User">
      <strategies>
        <add name="GoogleGeoCoder"
          type="Cms.Extensions.GoogleGeoCoder.UserStrategy"/>
      </strategies>
    </add>
  </objectStrategies>
</objectFactory>
```

More information about ObjectFactory objectStrategies

- Register extensions in the `<objectStrategies>` element of the *siteroot*`/ObjectFactory.config` file.
- For the element directly below `<objectStrategies>`, `<addname>`, enter a `name` to identify extension type. The following table. Show the valid `name`s.

- List of Valid Names
  - Inventory
  - Coupon
  - BasketCalculator
  - CouponCalculator
  - ShippingCalculator
  - TaxCalculator
  - Country
  - Region
  - Basket
  - Blog
  - Order
  - Customer
  - CatalogEntry
  - CommunityGroup
  - Tag
  - Message Board
  - MicroMessage
  - Content
  - Folder
  - User
  - Forum
  - WebEvent
  - Taxonomy

- Within a `<strategies>` element, add one or more content extensions. For each extension, insert a `name` and `type`. For example:

```
<strategies>
 <add name="MyFirstExample"
   type="Cms.Extensions.Samples.ContentExtensionsSample"/>
</strategies>
```

  - `name` is free-text.
  - `Type` is a fully-qualified name of the extension you are registering. It consists of namespace + "." + name of the class.

Testing the strategy

The new extension (created in the examples) adds "modified" to the end of a new content item's title. To test this, create new content in the Workarea; "modified" will be appended to the end of the title.

Ektron.Cms.Extensibility strategies

An event is an activity that occurs within Ektron and is exposed through the Extension Framework. An *event handler* is a method that executes when an event occurs.

NOTE: `onBefore` lets you manipulate the current data *before* it is updated. In contrast, `onAfter` events do not let you change a value in the contentData object for the content being affected. `onAfter` events only update data somewhere else (such as within Ektron or a third-party database).

This section also contains the following topics.

ActivityCommentStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ActivityCommentStrategy()`

  Summary: Constructor.

```
public ActivityCommentStrategy()
```

- `OnAfterDeleteActivityComment(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Activity Comment is deleted.

```
public virtual void
 OnAfterDeleteActivityComment(long id,
 Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateActivityComment (Ektron.Cms.Activity.ActivityCommentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Activity Comment is edited.

```
public virtual void
  OnAfterUpdateActivityComment(Ektron.Cms.Activity.ActivityCommentData
  activity, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

ActivityStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ActivityStrategy()`

  Summary: Constructor.

```
public ActivityStrategy()
```

- `OnAfterDeleteActivity(long, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called after a Activity is deleted

```
public virtual void OnAfterDeleteActivity(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateActivity(Ektron.Cms.Activity.ActivityData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Activity is edited.

```
public virtual void
  OnAfterUpdateActivity(Ektron.Cms.Activity.ActivityData activity,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

AdaptiveLibraryImages

Namespace: `Ektron.Cms.Extensibility`

- `Library`

  Summary: Gets a reference to the library manager.

```
public Ektron.Cms.Content.ILibraryManager Library { get; }
```

- `OnAfterAdd(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Generates the adaptive image cache for added library images.

```
public override void OnAfterAdd(Ektron.Cms.LibraryData eventItem,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Updates the adaptive image cache for library images.

```
public override void OnAfterUpdate(Ektron.Cms.LibraryData eventItem,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Cleans up references to the library image from the adaptive image cache.

```
public override void OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

AssignPreviewDeviceBreakpointStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: Assigns device previews from other breakpoints

```
public override void OnAfterAddDeviceBreakpoint(
  Ektron.Cms.Settings.Mobile.DeviceBreakpointData breakpoint)
```

- `OnAfterUpdateDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

Summary: Confirms device previews currently assigned to the breakpoint and searches for previews from other breakpoints to assign.

```
public override void OnAfterUpdateDeviceBreakpoint(
  Ektron.Cms.Settings.Mobile.DeviceBreakpointData breakpoint)
```

- `OnBeforeDeleteDeviceBreakpoint(long)`

  Summary: Assigns device previews orphaned by the breakpoint being deleted to the next largest breakpoint or none.

```
public override void OnBeforeDeleteDeviceBreakpoint(long id)
```

BlogStrategy

Namespace: `Ektron.Cms.Extensibility.Content`

- `BlogStrategy()`

  Summary: Constructor.

```
public BlogStrategy()
```

- `OnAfterAddBlogComment(Ektron.Cms.BlogComment, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddBlogComment(Ektron.Cms.BlogComment comment,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnAfterAddBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnAfterPublishBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterPublishBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnAfterUpdateBlogComment(Ektron.Cms.BlogComment, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterUpdateBlogComment(Ektron.Cms.BlogComment data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnAfterUpdateBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterUpdateBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)Summary: Summary:
```

- `OnBeforeAddBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnBeforePublishBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforePublishBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnBeforeUpdateBlogComment(Ektron.Cms.BlogComment, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateBlogComment(Ektron.Cms.BlogComment data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

- `OnBeforeUpdateBlogPost(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateBlogPost(Ektron.Cms.ContentData data,
  Ektron.Cms.Extensibility.CmsEventArgs args)
```

CancellableEventArgs

Namespace: `Ektron.Cms.Extensibility`

- `CancellableEventArgs()`

  Summary: Constructor.

```
public CancellableEventArgs()
```

- `CancellableEventArgs(long)`

```
public CancellableEventArgs(long objectId)
```

- `CancellableEventArgs(long, EkRequestInformation)`

```
public CancellableEventArgs(long objectId,
  EkRequestInformation requestInformation)
```

- `CancellableEventArgs(long, EkRequestInformation, System.Data.Common.DbTransaction)`

```
public CancellableEventArgs(long objectId,
  EkRequestInformation requestInformation,
  System.Data.Common.DbTransaction transaction)
```

- `CancellationMessage`

  Summary: Gets or sets the message indicating the reason for the action cancellation.

```
public string CancellationMessage { set; get; }
```

- `IsCancelled`

  Summary: Gets or sets the is cancelled flag indicating whether or not the action raising the event should be cancelled.

```
public bool IsCancelled { set; get; }
```

CmsListStrategy

Namespace: `Ektron.Cms.Extensibility.Marketing`

- `CmsListStrategy()`

  Summary: Constructor.

```
public CmsListStrategy()
```

- `OnAfterAdd(Ektron.Cms.Marketing.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterAdd(Ektron.Cms.Marketing.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterSubscriberAdded(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterSubscriberAdded(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterSubscriberRemoved(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterSubscriberRemoved(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Marketing.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterUpdate(Ektron.Cms.Marketing.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.Marketing.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeAdd(Ektron.Cms.Marketing.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeSubscriberAdded(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeSubscriberAdded(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeSubscriberRemoved(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeSubscriberRemoved(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.Marketing.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeUpdate(Ektron.Cms.Marketing.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CmsMessageStrategy

Namespace: `Ektron.Cms.Extensibility`

- `CmsMessageStrategy()`

  Summary: Constructor.

```
public CmsMessageStrategy()
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a CmsMessageData object is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Messaging.CmsMessageData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a CmsMessageData object is edited.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.Messaging.CmsMessageData cmsMessageDataObject,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CmsMessageTypeStrategy

Namespace: `Ektron.Cms.Extensibility`

- `CmsMessageTypeStrategy()`

  Summary: Constructor.

```
public CmsMessageTypeStrategy()
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a CmsMessageTypeData object is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Messaging.CmsMessageTypeData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a CmsMessageTypeData object is edited.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.Messaging.CmsMessageTypeData
  cmsMessageTypeDataObject, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

CmsSubscriberStrategy

Namespace: `Ektron.Cms.Extensibility.Marketing`

- `OnAfterAdd(Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterAdd(Ektron.Cms.Marketing.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnAfterUpdate(Ektron.Cms.Marketing.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeAdd(Ektron.Cms.Marketing.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public override void
  OnBeforeUpdate(Ektron.Cms.Marketing.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CollectionStrategy

Namespace: `Ektron.Cms.Extensibility`

- `CollectionStrategy()`

  Summary: Constructor.

```
public CollectionStrategy()
```

- `OnAfterDeleteCollection(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a collection is deleted.

```
public virtual void OnAfterDeleteCollection(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateCollection (Ektron.Cms.Organization.ContentCollectionData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a collection is edited

```
public virtual void
  OnAfterUpdateCollection(Ektron.Cms.Organization.ContentCollectionData
  collectionData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CommunityGroupStrategy

Namespace: `Ektron.Cms.Extensibility`

- `CommunityGroupStrategy()`

  Summary: Constructor.

```
public CommunityGroupStrategy()
```

- `OnAdd(Ektron.Cms.CommunityGroupData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a new Community Group is added.

```
public virtual void OnAdd(Ektron.Cms.CommunityGroupData groupData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUserAdd(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user is added to a Community Group.

```
public virtual void OnAfterUserAdd(long CommunityGroupId,
  long userId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUserDelete(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user is removed from a Community Group.

```
public virtual void OnAfterUserDelete(long CommunityGroupId,
  long userId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Community Group is deleted.

```
public virtual void OnDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnUpdate(Ektron.Cms.CommunityGroupData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Community Group is updated.

```
public virtual void
  OnUpdate(Ektron.Cms.CommunityGroupData groupData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

ConfigurationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ConfigurationStrategy()`

  Summary: Constructor.

  ```
  public ConfigurationStrategy()
  ```

- `OnAfterAddConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnAfterAddConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

- `OnAfterDeleteConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnAfterDeleteConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

- `OnAfterUpdateConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnAfterUpdateConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

- `OnBeforeAddConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnBeforeAddConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

- `OnBeforeDeleteConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnBeforeDeleteConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

- `OnBeforeUpdateConfiguration(System.Collections.Hashtable, Ektron.Cms.Extensibility.CmsEventArgs)`

  ```
  public virtual void
    OnBeforeUpdateConfiguration(System.Collections.Hashtable siteVars,
    Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
  ```

ContentRatingStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ContentRatingStrategy()`

  Summary: Constructor.

```
public ContentRatingStrategy()
```

- `OnAfterDeleteContentRating(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Content Rating is deleted.

```
public virtual void OnAfterDeleteContentRating(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateContentRating(Ektron.Cms.ContentRatingData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Content Rating is edited.

```
public virtual void
  OnAfterUpdateContentRating(Ektron.Cms.ContentRatingData
  contentRating, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

ContentStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ContentStrategy()`

  Summary: Constructor.

```
public ContentStrategy()
```

- `OnAfterAddContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after new content is added.

```
public virtual void
  OnAfterAddContent(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterContentArchive(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual
  void OnAfterContentArchive(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterCopyContent(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterCopyContent(long contentId, long newId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterCopyContent(long, long, int, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterCopyContent(long contentId, long newId,
  int languageid, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after content is deleted.

```
public virtual void OnAfterDeleteContent(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterMoveContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterMoveContent(long contentId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterPublishContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after content is published.

```
public virtual void
  OnAfterPublishContent(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterSubmitContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterSubmitContent(long contentId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after content is saved.

```
public virtual void
  OnAfterUpdateContent(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before content is added.

```
public virtual void OnBeforeAddContent(Ektron.Cms.ContentData
  contentData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeContentArchive(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeContentArchive(Ektron.Cms.ContentData
  contentData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeCopyContent(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeCopyContent(long contentId, long newId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before content is deleted.

```
public virtual void OnBeforeDeleteContent(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeMoveContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeMoveContent(long contentId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforePublishContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called before content is published.

```
public virtual void
  OnBeforePublishContent(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeSubmitContent(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeSubmitContent(long contentId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateContent(Ektron.Cms.ContentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before content is saved.

```
public virtual void
  OnBeforeUpdateContent(Ektron.Cms.ContentData contentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CustomFieldStrategy

Namespace: `Ektron.Cms.Extensibility.Marketing`

- `CustomFieldStrategy()`

  Summary: Constructor.

```
public CustomFieldStrategy()
```

- `OnAfterAdd(Ektron.Cms.Marketing.CustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAdd(Ektron.Cms.Marketing.CustomFieldData
  customfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Marketing.CustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterUpdate(Ektron.Cms.Marketing.CustomFieldData
  customfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.Marketing.CustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAdd(Ektron.Cms.Marketing.CustomFieldData
  customfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnBeforeUpdate(Ektron.Cms.Marketing.CustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnBeforeUpdate(Ektron.Cms.Marketing.CustomFieldData
  customfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

CustomPropertyStrategy

Namespace: Ektron.Cms.Extensibility

- OnAfterAddCustomProperty(Ektron.Cms.Common.CustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnAfterAddCustomProperty(Ektron.Cms.Common.CustomPropertyData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterAddCustomPropertyObject (Ektron.Cms.Common.CustomPropertyObjectData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnAfterAddCustomPropertyObject(Ektron.Cms.Common.CustomPropertyObjectData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDeleteCustomProperty(long, int, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterDeleteCustomProperty(long propertyId,
  int languageId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDeleteCustomPropertyObject(long, int, EkEnumeration.CustomPropertyObjectType, long, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterDeleteCustomPropertyObject(long objectId,
  int languageId, EkEnumeration.CustomPropertyObjectType cmsObjectType,
  long propertyId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterUpdateCustomProperty(Ektron.Cms.Common.CustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnAfterUpdateCustomProperty(Ektron.Cms.Common.CustomPropertyData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterUpdateCustomPropertyObject (Ektron.Cms.Common.CustomPropertyObjectData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnAfterUpdateCustomPropertyObject(Ektron.Cms.Common.CustomPropertyObjectData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnBeforeAddCustomProperty(Ektron.Cms.Common.CustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnBeforeAddCustomProperty(Ektron.Cms.Common.CustomPropertyData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddCustomPropertyObject (Ektron.Cms.Common.CustomPropertyObjectData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddCustomPropertyObject(Ektron.Cms.Common.CustomPropertyObjectData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteCustomProperty(long, int, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeDeleteCustomProperty(long propertyId, int languageId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteCustomPropertyObject(long, int, EkEnumeration.CustomPropertyObjectType, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeDeleteCustomPropertyObject(long objectId, int languageId,
  EkEnumeration.CustomPropertyObjectType cmsObjectType, long propertyId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateCustomProperty (Ektron.Cms.Common.CustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateCustomProperty(Ektron.Cms.Common.CustomPropertyData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateCustomPropertyObject (Ektron.Cms.Common.CustomPropertyObjectData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateCustomPropertyObject(Ektron.Cms.Common.CustomPropertyObjectData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

DeviceBreakpointStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: This method is called after a device breakpoint is added.

```
public virtual void
  OnAfterAddDeviceBreakpoint(Ektron.Cms.Settings.Mobile.DeviceBreakpointData
  breakpoint)
```

- `OnAfterDeleteDeviceBreakpoint(long)`

  Summary: This method is called after a device breakpoint is deleted.

```
public virtual void OnAfterDeleteDeviceBreakpoint(long id)
```

- `OnAfterUpdateDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

Summary: This method is called after a device breakpoint is updated.

```
public virtual void
  OnAfterUpdateDeviceBreakpoint(Ektron.Cms.Settings.Mobile.DeviceBreakpointData
  breakpoint)
```

- `OnBeforeAddDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: This method is called before a device breakpoint is added.

```
public virtual void
  OnBeforeAddDeviceBreakpoint(Ektron.Cms.Settings.Mobile.DeviceBreakpointData
  breakpoint)
```

- `OnBeforeDeleteDeviceBreakpoint(long)`

  Summary: This method is called before a device breakpoint is deleted.

```
public virtual void OnBeforeDeleteDeviceBreakpoint(long id)
```

- `OnBeforeUpdateDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: This method is called before a device breakpoint is updated.

```
public virtual void
  OnBeforeUpdateDeviceBreakpoint(Ektron.Cms.Settings.Mobile.DeviceBreakpointData
  breakpoint)
```

ESyncDataTransformStrategy

Namespace: `Ektron.Cms.Extensibility`

9.00 and higher

- `OnAfterDataRowSelected(System.Data.DataRow, Ektron.Cms.CoreService.SyncDataTransformContext)`

  Summary: This method is called after the sync framework has determined the rows to be synced as per the sync criteria. By design, this event is raised synchronously for every row in the DataTable, so that there is minimal impact on eSync memory consumption or performance. *disconnectedRow:* A row corresponding to the actual row which will be synced. Any changes to this will be propagated back to the original row. Note however that this is disconnected from the actual DataRow object and does not provide access to the real DataTable or Dataset being used by the sync framework. Only row value changes are supported for transformation.

  context: This parameter provides more context about the DataRow being passed.

```
public virtual void
  OnAfterDataRowSelected(System.Data.DataRow disconnectedRow,
  Ektron.Cms.CoreService.SyncDataTransformContext context)
```

ESyncNotificationStrategy

Namespace: `Ektron.Cms.Extensibility`

9.00 and higher

- `OnAfterDatabaseSyncRunCompleteFromLocal (Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Database Sync initiated by an eSync run has completed. This method is provided because some eSync types can cause multiple database syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event. This method is called even if the database sync errors out.

  ```
  public virtual void
    OnAfterDatabaseSyncRunCompleteFromLocal(Ektron.Cms.CoreService.SyncProfile
    syncProfileData)
  ```

- `OnAfterDatabaseSyncRunCompleteFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Database Sync initiated by a peer eSync run has completed. This happens after OnAfterDatabaseSyncRunCompleteFromLocal() has been raised on the peer server. This method is provided because an eSync can cause multiple database syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event. This method is called even if the database sync errors out.

  ```
  public virtual void
    OnAfterDatabaseSyncRunCompleteFromPeer(Ektron.Cms.CoreService.PeerServerDetails
    peerDetails, Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnAfterDatabaseSyncRunErrorFromLocal(System.Exception, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Database Sync initiated by an eSync run has errored out. This method is provided because some eSync types can cause multiple database syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event.

  ```
  public virtual void
    OnAfterDatabaseSyncRunErrorFromLocal
    (System.Exception ex, Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnAfterDatabaseSyncRunErrorFromPeer(System.Exception, Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Database Sync initiated by a peer eSync run has errored out. This happens after OnAfterDatabaseSyncRunCompleteFromLocal() has been raised on the peer server. This method is provided because an eSync can cause multiple database

syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event.

```
public virtual void
  OnAfterDatabaseSyncRunErrorFromPeer(System.Exception ex,
  Ektron.Cms.CoreService.PeerServerDetails peerDetails,
  Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnAfterDatabaseSyncRunStartFromLocal (Ektron.Cms.CoreService.SyncProfile, Ektron.Cms.Extensibility.SyncCommandEventArgs)`

  Summary: This method is called after a Database Sync initiated by an eSync run has started. This method is provided because an eSync can cause multiple database syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event. This event is cancellable and properties can be propagated back to EWS via the syncProfileData parameter.

  ```
  public virtual void
    OnAfterDatabaseSyncRunStartFromLocal(Ektron.Cms.CoreService.SyncProfile
    syncProfileData, Ektron.Cms.Extensibility.SyncCommandEventArgs commandArgs)
  ```

- `OnAfterDatabaseSyncRunStartFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Database Sync initiated by a peer eSync run has started. This happens after OnAfterDatabaseSyncRunStartFromLocal() has been raised on the peer server. This method is provided because an eSync can cause multiple database syncs (Ex: Package Sync, UGC Sync). This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated for this event.

  ```
  public virtual void
    OnAfterDatabaseSyncRunStartFromPeer(Ektron.Cms.CoreService.PeerServerDetails
    peerDetails, Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnAfterESyncRunCompleteFromLocal (Ektron.Cms.CoreService.SyncSpecificDetails, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after an eSync run orchestrated by the local Ektron Windows Service has completed. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. This method is called even if eSync errors out.

  ```
  public virtual void
    OnAfterESyncRunCompleteFromLocal(Ektron.Cms.CoreService.SyncSpecificDetails
    details, Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnAfterESyncRunCompleteFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncSpecificDetails,`

Ektron.Cms.CoreService.SyncProfile)

Summary: This method is called after an eSync run orchestrated by a peer Ektron Windows Service has completed. This happens after OnAfterESyncRunCompleteFromLocal() has been raised on the peer server. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. This method is called even if eSync errors out.

```
public virtual void
  OnAfterESyncRunCompleteFromPeer(Ektron.Cms.CoreService.PeerServerDetails
  peerDetails, Ektron.Cms.CoreService.SyncSpecificDetails details,
  Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- OnAfterESyncRunErrorFromLocal(System.Exception, Ektron.Cms.CoreService.SyncSpecificDetails, Ektron.Cms.CoreService.SyncProfile)

  Summary: This method is called after an eSync run orchestrated by the local Ektron Windows Service has errored out. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterESyncRunErrorFromLocal(System.Exception ex,
    Ektron.Cms.CoreService.SyncSpecificDetails details,
    Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- OnAfterESyncRunErrorFromPeer(System.Exception, Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncSpecificDetails, Ektron.Cms.CoreService.SyncProfile)

  Summary: This method is called after an eSync run orchestrated by a peer Ektron Windows Service has errored out.This happens after OnAfterESyncRunErrorFromLocal() has been raised on the peer server. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterESyncRunErrorFromPeer(System.Exception ex,
    Ektron.Cms.CoreService.PeerServerDetails peerDetails,
    Ektron.Cms.CoreService.SyncSpecificDetails details,
    Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- OnAfterESyncRunStartFromLocal (Ektron.Cms.CoreService.SyncSpecificDetails, Ektron.Cms.CoreService.SyncProfile, Ektron.Cms.Extensibility.SyncCommandEventArgs)

  Summary: This method is called after an eSync run orchestrated by the local Ektron Windows Service has started. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterESyncRunStartFromLocal(Ektron.Cms.CoreService.SyncSpecificDetails
    details, Ektron.Cms.CoreService.SyncProfile syncProfileData,
    Ektron.Cms.Extensibility.SyncCommandEventArgs commandArgs)
  ```

- `OnAfterESyncRunStartFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.SyncSpecificDetails, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after an eSync run orchestrated by a peer Ektron Windows Service has started. This happens after `OnAfterESyncRunStartFromLocal()` has been raised on the peer server. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

```
public virtual void
  OnAfterESyncRunStartFromPeer(Ektron.Cms.CoreService.PeerServerDetails
  peerDetails, Ektron.Cms.CoreService.SyncSpecificDetails details,
  Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnAfterFolderSyncRunCompleteFromLocal (Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Folder Sync initiated by an eSync run has completed. This method is provided because some eSync types can cause multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. This method is called even if the database sync errors out.

```
public virtual void
  OnAfterFolderSyncRunCompleteFromLocal
  (Ektron.Cms.CoreService.FolderSyncProfile folderSyncProfileData,
  Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnAfterFolderSyncRunCompleteFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Folder Sync initiated by a peer eSync run has completed. This happens after `OnAfterFolderSyncRunCompleteFromPeer()` has been raised on the peer server. This method is provided because some eSync types can cause multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework. This method is called even if the file sync errors out.

```
public virtual void
  OnAfterFolderSyncRunCompleteFromPeer(Ektron.Cms.CoreService.PeerServerDetails
  peerDetails, Ektron.Cms.CoreService.FolderSyncProfile
  folderSyncProfileData, Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnAfterFolderSyncRunErrorFromLocal(System.Exception, Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Folder Sync initiated by an eSync run has errored out. This method is provided because some eSync types can cause

multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

```
public virtual void
  OnAfterFolderSyncRunErrorFromLocal(System.Exception ex,
  Ektron.Cms.CoreService.FolderSyncProfile folderSyncProfileData,
  Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnAfterFolderSyncRunErrorFromPeer(System.Exception, Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Folder Sync initiated by a peer eSync run has errored out. This happens after `OnAfterFolderSyncRunErrorFromLocal()` has been raised on the peer server. This method is provided because some eSync types can cause multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterFolderSyncRunErrorFromPeer(System.Exception ex,
    Ektron.Cms.CoreService.PeerServerDetails peerDetails,
    Ektron.Cms.CoreService.FolderSyncProfile folderSyncProfileData,
    Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnAfterFolderSyncRunStartFromLocal (Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile, Ektron.Cms.Extensibility.SyncCommandEventArgs)`

  Summary: This method is called after a Folder Sync initiated by an eSync run has started. This method is provided because some eSync types can cause multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterFolderSyncRunStartFromLocal(Ektron.Cms.CoreService.FolderSyncProfile
    folderSyncProfileData, Ektron.Cms.CoreService.SyncProfile syncProfileData,
    Ektron.Cms.Extensibility.SyncCommandEventArgs commandArgs)
  ```

- `OnAfterFolderSyncRunStartFromPeer (Ektron.Cms.CoreService.PeerServerDetails, Ektron.Cms.CoreService.FolderSyncProfile, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called after a Folder Sync initiated by a peer eSync run has started. This happens after `OnAfterFolderSyncRunStartFromLocal()` has been raised on the peer server. This method is provided because some eSync types can cause multiple folder syncs. This method is NOT initiated by the actual synchronization process being performed by the MS Sync Framework.

  ```
  public virtual void
    OnAfterFolderSyncRunStartFromPeer(Ektron.Cms.CoreService.PeerServerDetails
    peerDetails, Ektron.Cms.CoreService.FolderSyncProfile folderSyncProfileData,
    Ektron.Cms.CoreService.SyncProfile syncProfileData)
  ```

- `OnLocalDatabaseSyncProgress (Ektron.Cms.CoreService.DatabaseSyncProgress, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called when a database sync initiated locally is running. This method is initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated in a progress event.

```
public virtual void
  OnLocalDatabaseSyncProgress(Ektron.Cms.CoreService.DatabaseSyncProgress
  syncProgress, Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnLocalFileSyncProgress(Ektron.Cms.CoreService.FileSyncProgress, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called when a file sync initiated locally is running. This event is not raised for all file syncs. This method is initiated by the actual synchronization process being performed by the MS Sync Framework. The behavior of this event corresponds directly to the behavior of the MS Sync Framework 'SessionProgress' and 'StateChanged' events of the SyncOrchestrator class. Not all properties of the SyncProfile parameter are populated in a progress event.

```
public virtual void
  OnLocalFileSyncProgress(Ektron.Cms.CoreService.FileSyncProgress
  syncProgress, Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnPeerDatabaseSyncProgress (Ektron.Cms.CoreService.DatabaseSyncProgress, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called when a database sync initiated by a peer is running. This happens when the peer server is running database sync to the local server as part of the eSync process. This method is initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated in a progress event.

```
public virtual void
  OnPeerDatabaseSyncProgress(Ektron.Cms.CoreService.DatabaseSyncProgress
  syncProgress, Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

- `OnPeerFileSyncProgress(Ektron.Cms.CoreService.FileSyncProgress, Ektron.Cms.CoreService.SyncProfile)`

  Summary: This method is called when a file sync initiated by a peer is running. This happens when the peer server is running file sync to the local server as part of the eSync or Load Balancing process. This method is initiated by the actual synchronization process being performed by the MS Sync Framework. Not all properties of the SyncProfile parameter are populated in a progress event.

```
public virtual void
  OnPeerFileSyncProgress(Ektron.Cms.CoreService.FileSyncProgress
  syncProgress, Ektron.Cms.CoreService.SyncProfile syncProfileData)
```

FavoriteStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FavoriteStrategy()`

  Summary: Constructor.

```
public FavoriteStrategy()
```

- `OnAfterDeleteFavorite(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a favorite is deleted.

```
public virtual void
  OnAfterDeleteFavorite(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnAfterUpdateFavorite(Ektron.Cms.Community.FavoriteItemData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a favorite is edited.

```
public virtual void
  OnAfterUpdateFavorite(Ektron.Cms.Community.FavoriteItemData
  favoriteItemData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FavoriteTaxonomyStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FavoriteTaxonomyStrategy()`

  Summary: Constructor.

```
public abstract class FavoriteTaxonomyStrategy
```

- `OnAfterDeleteFavoriteTaxonomy(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Favorite Taxonomy is deleted.

```
public virtual void OnAfterDeleteFavoriteTaxonomy(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateFavoriteTaxonomy (Ektron.Cms.Community.FavoriteTaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Favorite Taxonomy is edited.

```
public virtual void
  OnAfterUpdateFavoriteTaxonomy(Ektron.Cms.Community.FavoriteTaxonomyData
  favoriteTaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FlagStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FlagStrategy()`

  Summary: Constructor.

```
public FlagStrategy()
```

- `OnAfterAddFlag(Ektron.Cms.ObjectFlagData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddFlag(Ektron.Cms.ObjectFlagData flagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteFlag(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDeleteFlag(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateFlag(Ektron.Cms.ObjectFlagData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterUpdateFlag(Ektron.Cms.ObjectFlagData flagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddFlag(Ektron.Cms.ObjectFlagData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddFlag(Ektron.Cms.ObjectFlagData flagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteFlag(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteFlag(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateFlag(Ektron.Cms.ObjectFlagData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateFlag(Ektron.Cms.ObjectFlagData flagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FolderStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FolderStrategy()`

  Summary: Constructor.

```
public FolderStrategy()
```

- `OnAfterAddFolder(Ektron.Cms.FolderData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a new folder is added.

```
public virtual void
  OnAfterAddFolder(Ektron.Cms.FolderData folderData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterCopy(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterCopy(long oldFolderID, long newFolderID,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteFolder(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a folder is deleted.

```
public virtual void
  OnAfterDeleteFolder(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterMove(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterMove(long folderID, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateFolder(Ektron.Cms.FolderData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after folder is updated.

```
public virtual void
  OnAfterUpdateFolder(Ektron.Cms.FolderData folderData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddFolder(Ektron.Cms.FolderData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a folder is added.

```
public virtual void
  OnBeforeAddFolder(Ektron.Cms.FolderData folderData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeCopy(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeCopy(long oldFolderID, long newFolderID,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteFolder(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a folder is deleted.

```
public virtual void OnBeforeDeleteFolder(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeMove(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeMove(long folderID,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateFolder(Ektron.Cms.FolderData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before changes to a folder are saved.

```
public virtual void OnBeforeUpdateFolder(Ektron.Cms.FolderData folderData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FormStrategy

Namespace: `Ektron.Cms.Extensibility.Content`

- `FormStrategy()`

  Summary: Constructor.

```
public ForumStrategy()
```

- `OnAfterSubmit(Ektron.Cms.FormData, Ektron.Cms.FormSubmittedData, string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterSubmit(Ektron.Cms.FormData formData,
  Ektron.Cms.FormSubmittedData submittedFormData, string formXml,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeSubmit(Ektron.Cms.FormData, Ektron.Cms.FormSubmittedData, string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeSubmit(Ektron.Cms.FormData formData,
  Ektron.Cms.FormSubmittedData submittedFormData, string formXml,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

ForumStrategy

Namespace: `Ektron.Cms.Extensibility`

- `ForumStrategy()`

  Summary: Constructor.

```
public ForumStrategy()
```

- `OnAfterAddTopic(Ektron.Cms.DiscussionTopic, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddTopic(Ektron.Cms.DiscussionTopic topic,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAddTopicReply(Ektron.Cms.TaskData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddTopicReply(Ektron.Cms.TaskData topicReply,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTopic(Ektron.Cms.DiscussionTopic, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterUpdateTopic(Ektron.Cms.DiscussionTopic topic,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddTopic(Ektron.Cms.DiscussionTopic, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddTopic(Ektron.Cms.DiscussionTopic topic,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddTopicReply(Ektron.Cms.TaskData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddTopicReply(Ektron.Cms.TaskData topicReply,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateTopic(Ektron.Cms.DiscussionTopic, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeUpdateTopic(Ektron.Cms.DiscussionTopic topic,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FriendsStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FriendsStrategy()`

  Summary: Constructor.

```
public FriendsStrategy()
```

- `OnAfterDeleteFriend(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a friend is deleted.

```
public virtual void OnAfterDeleteFriend(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateFriend(Ektron.Cms.Community.FriendsData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a friend is edited.

```
public virtual void
  OnAfterUpdateFriend(Ektron.Cms.Community.FriendsData friendsData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

FriendsTaxonomyStrategy

Namespace: `Ektron.Cms.Extensibility`

- `FriendsTaxonomyStrategy()`

  Summary: Constructor.

```
public FriendsTaxonomyStrategy()
```

- `OnAfterDeleteFriendTaxonomy(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a friend taxonomy is deleted.

```
public virtual void OnAfterDeleteFriendTaxonomy(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateFriendTaxonomy (Ektron.Cms.Community.FriendTaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a friend taxonomy is edited.

```
public virtual void
  OnAfterUpdateFriendTaxonomy(Ektron.Cms.Community.FriendTaxonomyData
  friendTaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

GenericPreviewDeviceBreakpointStrategy

Namespace: `Ektron.Cms.Extensibility`

- `GenericPreviewDeviceBreakpointStrategy()`

  Summary: Constructor. Initializes a new instance of the GenericPreviewDeviceBreakpointStrategy class and populates its internal data.

```
public GenericPreviewDeviceBreakpointStrategy()
```

- `OnAfterAddDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: Create a new device preview for the breakpoint for each available device preview template.

```
public override void OnAfterAddDeviceBreakpoint(
  Ektron.Cms.Settings.Mobile.DeviceBreakpointData breakpoint)
```

- `OnAfterUpdateDeviceBreakpoint (Ektron.Cms.Settings.Mobile.DeviceBreakpointData)`

  Summary: Updates preview devices for the breakpoint which have been created from a device preview template so their width matches the breakpoint.

```
public override void OnAfterUpdateDeviceBreakpoint(
  Ektron.Cms.Settings.Mobile.DeviceBreakpointData breakpoint)
```

- `OnBeforeDeleteDeviceBreakpoint(long)`

  Summary: Deletes preview devices for the breakpoint which have been created from a device preview template.

```
public override void OnBeforeDeleteDeviceBreakpoint(long id)
```

LibraryStrategy

Namespace: `Ektron.Cms.Extensibility`

- `LibraryStrategy()`

  Summary: Constructor.

```
public LibraryStrategy()
```

- `OnAfterAdd(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after a library item is added.

```
public virtual void
  OnAfterAdd(Ektron.Cms.LibraryData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after a library item is deleted.

```
public virtual void
  OnAfterDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after a library item is updated.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.LibraryData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a library item is added.

```
public virtual void
  OnBeforeAdd(Ektron.Cms.LibraryData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a library item is deleted.

```
public virtual void
  OnBeforeDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.LibraryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a library item is updated.

```
public virtual void
  OnBeforeUpdate(Ektron.Cms.LibraryData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

ListStrategy

Namespace: `Ektron.Cms.Extensibility.Marketing`

- `ListStrategy()`

  Summary: Constructor.

```
public ListStrategy()
```

- `OnAfterAdd(Ektron.Cms.Marketing.ListData, Ektron.Cms.Extensibility.CmsEventArgs))`

  Summary: Called after a list item is added.

```
public virtual void
  OnAfterAdd(Ektron.Cms.Marketing.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after a list item is deleted.

```
public virtual void
  OnAfterDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnAfterSubscriberAdded(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterSubscriberAdded(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterSubscriberRemoved(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterSubscriberRemoved(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after a list item is updated.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.ListData listData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a list item is added.

```
public virtual void
  OnBeforeAdd(Ektron.Cms.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a list item is deleted.

```
public virtual void
  OnBeforeDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnBeforeSubscriberAdded(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeSubscriberAdded(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeSubscriberRemoved(long, Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeSubscriberRemoved(long listId,
  Ektron.Cms.Marketing.SubscriberData subscriberData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.ListData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a list item is updated.

```
public virtual void
  OnBeforeUpdate(Ektron.Cms.ListData listdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

LoadBalancerNotificationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `LoadBalancerNotificationStrategy()`

  Summary: Constructor.

```
protected LoadBalancerNotificationStrategy()
```

- `OnAfterRunComplete (System.Collections.Generic.List<Ektron.Cms.CoreService.LoadBalancedFile>, Ektron.Cms.CoreService.LoadBalanceProfile)`

  Summary: This method is called after the local load balancer synchronization session has completed successfully. If the session errored out, this event will not be raised.

```
public virtual void
  OnAfterRunComplete(System.Collections.Generic.List<LoadBalancedFile>
  files, Ektron.Cms.CoreService.LoadBalanceProfile profile)
```

- `OnAfterRunError(System.Exception, System.Collections.Generic.List<Ektron.Cms.CoreService.LoadBalancedFile>, Ektron.Cms.CoreService.LoadBalanceProfile)`

  Summary: This method is called after the local load balancer synchronization session has errored out.

```
public virtual void OnAfterRunError(System.Exception ex,
  System.Collections.Generic.List<LoadBalancedFile> files,
  Ektron.Cms.CoreService.LoadBalanceProfile profile)
```

- `OnBeforeRunStart (System.Collections.Generic.List<Ektron.Cms.CoreService.LoadBalancedFile>, Ektron.Cms.CoreService.LoadBalanceProfile)`

  Summary: This method is called before the local load balancer starts syncing the files in the queue.

```
public virtual void
  OnBeforeRunStart(System.Collections.Generic.List<LoadBalancedFile>
  files, Ektron.Cms.CoreService.LoadBalanceProfile profile)
```

LocaleStrategy

Namespace: `Ektron.Cms.Extensibility`

- `DetermineRequestedLocale(System.Web.HttpRequest, System.Web.HttpCookie, ref Ektron.Cms.Localization.LocaleData, Ektron.Cms.BusinessObjects.Localization.ILocaleManager, Ektron.Cms.Extensibility.CancellableEventArgs)`

  Summary: Determines the locale given the HttpRequest and HttpCookie.

```
public virtual void
  DetermineRequestedLocale(System.Web.HttpRequest request,
  System.Web.HttpCookie cookie,
  ref Ektron.Cms.Localization.LocaleData requestedLocale,
```

```
  Ektron.Cms.BusinessObjects.Localization.ILocaleManager sender,
  Ektron.Cms.Extensibility.CancellableEventArgs eventArgs)
```

- `LocaleStrategy()`

  Summary: Constructor. Initializes a new instance of the LocaleStrategy class.

```
public LocaleStrategy()
```

- `OnAfterAddLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterAddLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterDeleteLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDisableLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterDisableLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterEditLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnAfterEditLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterEnableLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterEnableLocale(Ektron.Cms.Localization.LocaleData
  localeData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeAddLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeDeleteLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDisableLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeDisableLocale(Ektron.Cms.Localization.LocaleData
  localeData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeEditLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeEditLocale(Ektron.Cms.Localization.LocaleData localeData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeEnableLocale(Ektron.Cms.Localization.LocaleData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void
  OnBeforeEnableLocale(Ektron.Cms.Localization.LocaleData
  localeData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

LocalizationObjectStrategy

Namespace: `Ektron.Cms.Extensibility`

- `LocalizationObjectStrategy()`

  Summary: Constructor.

```
public LocalizationObjectStrategy()
```

- `OnAfterMarkState(Ektron.Cms.Localization.LocalizationState, Ektron.Cms.Extensibility.LocalizationObjectStrategy.LocalizationObjectEventArgs)`

```
public virtual void
  OnAfterMarkState(Ektron.Cms.Localization.LocalizationState state,
  Ektron.Cms.Extensibility.LocalizationObjectStrategy.LocalizationObjectEventArgs
  eventArgs)
```

- `OnBeforeGetContentLocalizationState (Ektron.Cms.Extensibility.LocalizationObjectStrategy.ContentLocalizationStateEventArgs)`

```
public virtual void
  OnBeforeGetContentLocalizationState(Ektron.Cms.Extensibility
  .LocalizationObjectStrategy.ContentLocalizationStateEventArgs eventArgs)
```

- `OnBeforeMarkState(Ektron.Cms.Localization.LocalizationState, Ektron.Cms.Extensibility.LocalizationObjectStrategy.LocalizationObjectCancellableEventArgs)`

```
public virtual void
  OnBeforeMarkState(Ektron.Cms.Localization.LocalizationState state,
  Ektron.Cms.Extensibility.LocalizationObjectStrategy
 .LocalizationObjectCancellableEventArgs eventArgs)
```

LocalizationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `LocalizationStrategy()`

  Summary: Constructor. Initializes a new instance of the LocalizationStrategy class.

```
public LocalizationStrategy()
```

- `OnAfterCompressFiles (Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called after files are copied and compressed for each target locale.

```
public virtual void OnAfterCompressFiles(
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterExport (Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: Always called when the export job is done, whether cancelled or not. The job id is provided in the eventArgs.

```
public virtual void OnAfterExport(
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterExportItem(Ektron.Cms.Localization.LocalizableItem, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called after a CMS object is exported.

```
public virtual void OnAfterExportItem(
  Ektron.Cms.Localization.LocalizableItem item,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterImport (Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: Always called when the import job is done, whether cancelled or not. The job id is provided in the eventArgs.

```
public virtual void OnAfterImport(
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs|
  eventArgs)
```

- `OnAfterMergeXliff(string, ref string, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called after imported XLIFF is merged with its skeleton.

```
public virtual void OnAfterMergeXliff(
  string xliffFilePath, ref string translatedContent,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterUpdate(string, string, int, int, System.DateTime, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

Summary: This method is called after the content is updated in the database. ObjectType and ObjectId are provided in the eventArgs.

```
public virtual void OnAfterUpdate(
  string fileName, string skeletonFileName,
  int translatedLanguageID,
  int originalLanguageID,
  System.DateTime dateModified,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterValidateXliff(string, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called after imported XLIFF is validated.

```
public virtual void
  OnAfterValidateXliff(string xliffFilePath,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnAfterZipFiles(System.Collections.Generic.List<string>, System.Collections.Generic.List<string>, System.Collections.Generic.Dictionary<string,System.Collections.Generic.List<string>>, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after files are zipped together.

```
public virtual void
  OnAfterZipFiles(System.Collections.Generic.List<string> fileNames,
  System.Collections.Generic.List<string> zipFileNames,
  System.Collections.Generic.Dictionary<string,List<string>>
  filesPerZip, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeCompressFiles(int, System.Collections.Generic.List<Ektron.Cms.Localization.LocaleData>, string, ref string, ref long, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before files are copied and compressed for each target locale. May be cancelled. OnAfterCompressFiles is always called, even if cancelled.

```
public virtual void
  OnBeforeCompressFiles(int sourceLanguageId,
  System.Collections.Generic.List<LocaleData> targetLocales,
  string path, ref string xliffFileNameFormat,
  ref long maxZipFileSize,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeExport(Ektron.Cms.Localization.LocalizationExportJob, string, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

Summary: This method is called before a XLIFF export occurs. May be cancelled. OnAfterExport is always called, even if cancelled.

```
public virtual void
  OnBeforeExport(Ektron.Cms.Localization.LocalizationExportJob exportJob,
  string xliffPath,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeExportItem(Ektron.Cms.Localization.LocalizableItem, Ektron.Cms.Localization.LocalizationState, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before a CMS object is exported.

```
public virtual void
  OnBeforeExportItem(Ektron.Cms.Localization.LocalizableItem item,
  Ektron.Cms.Localization.LocalizationState locState,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeImport(string, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before a XLIFF import occurs. May be cancelled. OnAfterImport is always called, even if cancelled.

```
public virtual void
  OnBeforeImport(string xliffUrl,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeMergeXliff(string, string, Ektron.Cms.Xslt.ArgumentList, System.Xml.XmlUrlResolver, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before imported XLIFF is merged with its skeleton.

```
public virtual void
  OnBeforeMergeXliff(string xliffFilePath, string mergeXsltFilePath,
  Ektron.Cms.Xslt.ArgumentList args, System.Xml.XmlUrlResolver
  skeletonResolver,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeUpdate(string, string, int, int, System.DateTime, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before the content is updated in the database.

```
public virtual void
  OnBeforeUpdate(string fileName, string skeletonFileName,
  int translatedLanguageID, int originalLanguageID,
  System.DateTime dateModified,
```

```
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeValidateXliff(string, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called before imported XLIFF is validated.

```
public virtual void
  OnBeforeValidateXliff(string xliffFilePath,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

- `OnBeforeZipFiles(string, ref string[], ref string, ref string, ref long, Ektron.Cms.Extensibility.CancellableEventArgs)`

  Summary: This method is called before files are zipped together.

```
public virtual void
  OnBeforeZipFiles(string path, ref string[] fileNamePatterns,
  ref string zipFilePath, ref string zipFileNameFormat,
  ref long maxZipFileSize, Ektron.Cms.Extensibility.CancellableEventArgs
  eventArgs)
```

- `OnCreateSkeleton(ref string, ref string, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called when an XLIFF skeleton is created, but before it is saved. ObjectType and ObjectId are provided in the eventArgs.

```
public virtual void
  OnCreateSkeleton(ref string fileName, ref string skeleton,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnCreateXliff(ref string, ref string, Ektron.Cms.Extensibility.LocalizationStrategy.CreateXliffEventArgs)`

  Summary: This method is called when an XLIFF file is created from a skeleton, but before it is saved. One XLIFF file is created for all target languages.

```
public virtual void
  OnCreateXliff(ref string fileName, ref string xliff,
  Ektron.Cms.Extensibility.LocalizationStrategy.CreateXliffEventArgs
  eventArgs)
```

- `OnGetExportList(Ektron.Cms.Localization.LocalizationExportJob, System.Collections.Generic.List<Ektron.Cms.Localization.LocalizableItem>, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called when the list of items to export is generated. To export more items, add them to the list. To prevent exporting items, remove them from the list.

```
public virtual void
  OnGetExportList(Ektron.Cms.Localization.LocalizationExportJob
  exportJob, System.Collections.Generic.List<LocalizableItem> itemList,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnGetImportList(System.Collections.Generic.List<string>, Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs)`

  Summary: This method is called when the list of files to import is generated. To import more files, add them to the list. To prevent importing files, remove them from the list.

```
public virtual void
  OnGetImportList(System.Collections.Generic.List<string> fileNames,
  Ektron.Cms.Extensibility.LocalizationStrategy.LocalizationEventArgs
  eventArgs)
```

- `OnGetUnzippedFile(string, Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs)`

  Summary: This method is called after a zip file is unzipped, and for each file present in the zip.

```
public virtual void
  OnGetUnzippedFile(string fileNameAndPath,
  Ektron.Cms.Extensibility.LocalizationStrategy.CancellableLocalizationEventArgs
  eventArgs)
```

MachineTranslationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `MachineTranslationStrategy()`

  Summary: Constructor. Initializes a new instance of the MachineTranslationStrategy class.

```
public MachineTranslationStrategy()
```

- `Translate(ref string, Ektron.Cms.Extensibility.MachineTranslationStrategy.MachineTranslationEventArgs)`

  Summary: Translates the given content using machine translation. Typically `eventArgs.Locale.Tag.PrivateUseSubtag` will be `mt`.

```
public virtual void Translate(ref string content,
  Ektron.Cms.Extensibility.MachineTranslationStrategy.MachineTranslationEventArgs
  eventArgs)
```

MenuStrategy

Namespace: `Ektron.Cms.Extensibility`

- MenuStrategy()

  Summary: Constructor.

```
public MenuStrategy()
```

- OnAfterAddMenu(Ektron.Cms.Organization.MenuData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void
  OnAfterAddMenu(Ektron.Cms.Organization.MenuData menuData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterAddMenuItem(Ektron.Cms.Organization.MenuItemData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterAddMenuItem(Ektron.Cms.Organization.MenuItemData
  menuItemData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterAddSubMenu(Ektron.Cms.Organization.SubMenuData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterAddSubMenu(Ektron.Cms.Organization.SubMenuData
  subMenuData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDeleteMenu(long, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterDeleteMenu(long menuId,
 Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDeleteMenuItem(long, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterDeleteMenuItem(long menuItemId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDeleteSubMenu(long, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterDeleteSubMenu(long subMenuId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterUpdateMenu(Ektron.Cms.Organization.MenuData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterUpdateMenu(Ektron.Cms.Organization.MenuData
  menuData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterUpdateMenuItem(Ektron.Cms.Organization.MenuItemData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterUpdateMenuItem(
  Ektron.Cms.Organization.MenuItemData menuItemData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterUpdateSubMenu(Ektron.Cms.Organization.SubMenuData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnAfterUpdateSubMenu(
  Ektron.Cms.Organization.SubMenuData subMenuData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnBeforeAddMenu(Ektron.Cms.Organization.MenuData, Ektron.Cms.Extensibility.CmsEventArgs)

```
public virtual void OnBeforeAddMenu(
  Ektron.Cms.Organization.MenuData menuData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddMenuItem(Ektron.Cms.Organization.MenuItemData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddMenuItem(
  Ektron.Cms.Organization.MenuItemData menuItemData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddSubMenu(Ektron.Cms.Organization.SubMenuData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddSubMenu(
  Ektron.Cms.Organization.SubMenuData subMenuData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteMenu(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteMenu(long menuId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteMenuItem(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteMenuItem(long menuItemId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteSubMenu(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteSubMenu(long subMenuId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateMenu(Ektron.Cms.Organization.MenuData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdateMenu(Ektron.Cms.Organization.MenuData
  menuData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateMenuItem(Ektron.Cms.Organization.MenuItemData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdateMenuItem(
  Ektron.Cms.Organization.MenuItemData menuItemData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateSubMenu(Ektron.Cms.Organization.SubMenuData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdateSubMenu(
  Ektron.Cms.Organization.SubMenuData subMenuData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

MessageBoardStrategy

Namespace: `Ektron.Cms.Extensibility`

- `MessageBoardStrategy()`

  Summary: Constructor.

```
public MessageBoardStrategy()
```

- `OnAdd(Ektron.Cms.MessageBoardData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after new Message Board item/post is added.

```
public virtual void OnAdd(Ektron.Cms.MessageBoardData messageBoardData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a MessageBoardData object is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterReplyAdd(Ektron.Cms.MessageBoardData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after someone replies to Message Board post.

```
public virtual void OnAfterReplyAdd(
 Ektron.Cms.MessageBoardData messageBoardData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.MessageBoardData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a MessageBoardData object is edited.

```
public virtual void OnAfterUpdate(Ektron.Cms.MessageBoardData
  messageBoardData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Message Board post is deleted.

```
public virtual void OnDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnMessageApprove(Ektron.Cms.MessageBoardData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before Message Board post is approved.

```
public virtual void OnMessageApprove(Ektron.Cms.MessageBoardData
  messageBoardData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnUpdate(Ektron.Cms.MessageBoardData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after Message Board post is updated.

```
public virtual void OnUpdate(Ektron.Cms.MessageBoardData
  messageBoardData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

MetaDataStrategy

Namespace: `Ektron.Cms.Extensibility`

Valid name: `MetaData`

NOTE: These strategies are for metadata types. For metadata values, subscribe to *ContentStrategy* on page 2576.

- `MetaDataStrategy()`

  Summary: Constructor.

```
public MetaDataStrategy()
```

- `OnAfterMetaTypeAdded(Ektron.Cms.MetaTypeBaseData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a meta type is added.

```
public virtual void OnAfterMetaTypeAdded(Ektron.Cms.MetaTypeBaseData
  metaType, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterMetaTypeDeleted(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a meta type is deleted.

```
public virtual void OnAfterMetaTypeDeleted(long metaTypeId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterMetaTypeEdited(Ektron.Cms.MetaTypeBaseData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a meta type is edited.

```
public virtual void OnAfterMetaTypeEdited(Ektron.Cms.MetaTypeBaseData
  metaType, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

MicroMessageStrategy

Namespace: `Ektron.Cms.Extensibility`

- `MicroMessageStrategy()`

  Summary: Constructor.

```
public MicroMessageStrategy()
```

- `OnAfterAdd(Ektron.Cms.MicroMessageData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after new Micro Message post is added.

```
public virtual void OnAfterAdd(Ektron.Cms.MicroMessageData
  microMessageData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Micro Message post is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.MicroMessageData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a MicroMessage is edited.

```
public virtual void OnAfterUpdate(Ektron.Cms.MicroMessageData
  microMessageData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.MicroMessageData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called before a Micro Message post is added.

```
public virtual void OnBeforeAdd(Ektron.Cms.MicroMessageData
  microMessageData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Micro Message post is deleted.

```
public virtual void OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.MicroMessageData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdate(Ektron.Cms.MicroMessageData
  microMessageData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

NotificationAgentSettingStrategy

Namespace: `Ektron.Cms.Extensibility`

- `NotificationAgentSettingStrategy()`

  Summary: Constructor.

```
public NotificationAgentSettingStrategy()
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a NotificationAgentData object is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Notifications.NotificationAgentData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a NotificationAgentData object is edited.

```
public virtual void OnAfterUpdate(
  Ektron.Cms.Notifications.NotificationAgentData notificationAgentData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

NotificationPreferenceStrategy

Namespace: `Ektron.Cms.Extensibility`

- `NotificationPreferenceStrategy()`

  Summary: Constructor.

```
public NotificationPreferenceStrategy()
```

- `OnAfterDeleteNotificationPreference(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a NotificationPreference is deleted.

```
public virtual void OnAfterDeleteNotificationPreference(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateNotificationPreference (Ektron.Cms.Notifications.NotificationPreferenceData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a NotificationPreference is edited.

```
public virtual void OnAfterUpdateNotificationPreference(
  Ektron.Cms.Notifications.NotificationPreferenceData
  notificationPreferenceData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

PermissionStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddPermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterAddPermissionData(Ektron.Cms.PermissionData
  data, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeletePermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDeletePermissionData(
  Ektron.Cms.PermissionData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateItemInheritance(long, string, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterUpdateItemInheritance(long itemId,
  string requestType, bool enable,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdatePermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterUpdatePermissionData(
  Ektron.Cms.PermissionData data, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnAfterUpdatePrivateSetting(long, string, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterUpdatePrivateSetting(long itemId,
  string requestType, bool enable,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddPermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddPermissionData(
  Ektron.Cms.PermissionData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeletePermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeletePermissionData(
  Ektron.Cms.PermissionData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateItemInheritance(long, string, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdateItemInheritance(long itemId,
  string requestType, bool enable,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdatePermissionData(Ektron.Cms.PermissionData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdatePermissionData(
  Ektron.Cms.PermissionData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdatePrivateSetting(long, string, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdatePrivateSetting(long itemId,
  string requestType, bool enable,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

PseudoLocalizationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `PseudoLocalizationStrategy()`

  Summary: Constructor. Initializes a new instance of the PseudoLocalizationStrategy class.

```
public PseudoLocalizationStrategy()
```

- `PseudoLocalize(ref string, Ektron.Cms.Extensibility.PseudoLocalizationStrategy.PseudoLocalizationEventArgs)`

  Summary: Localizes the given content into a "pseudo" language to test translation-readiness. Typically, `eventArgs.Locale.Tag.PrivateUseSubtag` will be `pseudo`.

```
public virtual void PseudoLocalize(ref string content,
  Ektron.Cms.Extensibility.PseudoLocalizationStrategy.PseudoLocalizationEventArgs
  eventArgs)
```

QueryStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAdvancedQuery(Ektron.Cms.Search.AdvancedSearchCriteria, Ektron.Cms.Search.SearchResponseData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Signals the completion of an 'advanced' query.

```
public virtual void OnAfterAdvancedQuery(
  Ektron.Cms.Search.AdvancedSearchCriteria criteria,
  Ektron.Cms.Search.SearchResponseData response,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterKeywordQuery(Ektron.Cms.Search.KeywordSearchCriteria, Ektron.Cms.Search.SearchResponseData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Signals the completion of a 'keyword' query.

```
public virtual void OnAfterKeywordQuery(
  Ektron.Cms.Search.KeywordSearchCriteria criteria,
  Ektron.Cms.Search.SearchResponseData response,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdvancedQuery(Ektron.Cms.Search.AdvancedSearchCriteria, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Signals that an 'advanced' query is about to be requested.

```
public virtual void OnBeforeAdvancedQuery(
  Ektron.Cms.Search.AdvancedSearchCriteria criteria,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeKeywordQuery(Ektron.Cms.Search.KeywordSearchCriteria, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Signals that a 'keyword' query is about to be requested.

```
public virtual void OnBeforeKeywordQuery(
  Ektron.Cms.Search.KeywordSearchCriteria criteria,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `QueryStrategy()`

  Summary: Constructor.

```
public QueryStrategy()
```

RatingStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteRating(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Object Rating is deleted.

```
public virtual void OnAfterDeleteRating(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateRating(Ektron.Cms.RatingData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Object Rating is edited.

```
public virtual void OnAfterUpdateRating(Ektron.Cms.RatingData
  ratingData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `RatingStrategy()`

  Summary: Constructor.

```
public RatingStrategy()
```

RoleStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddCustomRolePermission(string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterAddCustomRolePermission(string roleName,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAddOrUpdateRoleMember(long, Ektron.Cms.RoleMemberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterAddOrUpdateRoleMember(long roleId,
  Ektron.Cms.RoleMemberData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteCustomRolePermission(string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDeleteCustomRolePermission(string roleName,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDropRoleMember(long, Ektron.Cms.RoleMemberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDropRoleMember(long roleId,
  Ektron.Cms.RoleMemberData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddCustomRolePermission(string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddCustomRolePermission(string roleName,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddOrUpdateRoleMember(long, Ektron.Cms.RoleMemberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddOrUpdateRoleMember(long roleId,
  Ektron.Cms.RoleMemberData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteCustomRolePermission(string, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteCustomRolePermission(string
  roleName, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDropRoleMember(long, Ektron.Cms.RoleMemberData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDropRoleMember(long roleId,
  Ektron.Cms.RoleMemberData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

SyncCommentEventArgs

Namespace: `Ektron.Cms.Extensibility`

- `SyncCommandEventArgs()`

  Summary: Constructor. Initializes a new instance of the SyncCommandEventArgs class.

```
public SyncCommandEventArgs()
```

- StrategyTypeRequestingCancellation

```
public System.Type StrategyTypeRequestingCancellation { set; get; }
```

- SyncCancellationArgs

```
public System.ComponentModel.CancelEventArgs
  SyncCancellationArgs { set; get; }
```

SubscriberCustomFieldStrategy

Namespace: Ektron.Cms.Extensibility.Marketing

- OnAfterAdd(Ektron.Cms.Marketing.SubscriberCustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs))

  Summary: Called after an item is added.

```
public virtual void
  OnAfterAdd(Ektron.Cms.Marketing.SubscriberCustomFieldData
  subscribercustomfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)

  Summary: Called after an item is deleted.

```
public virtual void
  OnAfterDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- OnAfterUpdate(Ektron.Cms.SubscriberCustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)

  Summary: Called after an item is updated.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.SubscriberCustomFieldData
  subscribercustomfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnBeforeAdd(Ektron.Cms.SubscriberCustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)

  Summary: Called before an item is added.

```
public virtual void
  OnBeforeAdd(Ektron.Cms.SubscriberCustomFieldData
  subscribercustomfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)

  Summary: Called before a list item is deleted.

```
public virtual void
  OnBeforeDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- OnBeforeUpdate(Ektron.Cms.SubscriberCustomFieldData, Ektron.Cms.Extensibility.CmsEventArgs)

  Summary: Called before a list item is updated.

```
public virtual void
  OnBeforeUpdate(Ektron.Cms.SubscriberCustomFieldData
  subscribercustomfielddata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `SubscriberCustomFieldStrategy()`

  Summary: Constructor

```
public SubscriberCustomFieldStrategy()
```

SubscriberStrategy

Namespace: `Ektron.Cms.Extensibility.Marketing`

- `OnAfterAdd(Ektron.Cms.Marketing.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs))`

  Summary: Called after an item is added.

```
public virtual void
  OnAfterAdd(Ektron.Cms.Marketing.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after an item is deleted.

```
public virtual void
  OnAfterDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called after an item is updated.

```
public virtual void
  OnAfterUpdate(Ektron.Cms.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before an item is added.

```
public virtual void
  OnBeforeAdd(Ektron.Cms.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Called before a list item is deleted.

```
public virtual void
  OnBeforeDelete(long id, Ektron.Cms.Extensibility.CmsEventArgs
  eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.SubscriberData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: Called before a list item is updated.

```
public virtual void
  OnBeforeUpdate(Ektron.Cms.SubscriberData
  subscriberdata,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `SubscriberStrategy()`

  Summary: Constructor

```
public SubscriberStrategy()
```

TagStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAdd(Ektron.Cms.TagData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after Tag is added.

```
public virtual void OnAdd(Ektron.Cms.TagData tagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterObjectTagDeleted(long, long, EkEnumeration.CMSObjectTypes, long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterObjectTagDeleted(long tagId, long objectId,
  EkEnumeration.CMSObjectTypes objectType, long userId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterObjectTagged(Ektron.Cms.TagAssignmentData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterObjectTagged(Ektron.Cms.TagAssignmentData
  tagAssignment, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Tag is deleted.

```
public virtual void OnDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnUpdate(Ektron.Cms.TagData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Tag is updated.

```
public virtual void OnUpdate(Ektron.Cms.TagData tagData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TagStrategy()`

  Summary: Constructor.

```
public TagStrategy()
```

TaskCategoryStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteTaskCategory(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a task category is deleted.

```
public virtual void OnAfterDeleteTaskCategory(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTaskCategory(Ektron.Cms.TaskCategoryData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a task category is edited.

```
public virtual void OnAfterUpdateTaskCategory(
  Ektron.Cms.TaskCategoryData taskCategoryData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TaskCategoryStrategy()`

  Summary: Constructor.

```
public TaskCategoryStrategy()
```

TaskStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteTask(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a task is deleted.

```
public virtual void OnAfterDeleteTask(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTask(Ektron.Cms.TaskData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a task is edited.

```
public virtual void OnAfterUpdateTask(
  Ektron.Cms.TaskData taskData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TaskStrategy()`

  Summary: Constructor.

```
public TaskStrategy()
```

TaxonomyItemStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteTaxonomyItem(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a TaxonomyItem is deleted.

```
public virtual void OnAfterDeleteTaxonomyItem(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTaxonomyItem(Ektron.Cms.TaxonomyItemData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a TaxonomyItem is edited.

```
public virtual void OnAfterUpdateTaxonomyItem(
  Ektron.Cms.TaxonomyItemData taxonomyItem,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TaxonomyItemStrategy()`

  Summary: Constructor.

```
public TaxonomyItemStrategy()
```

TaxonomyStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAdd(Ektron.Cms.TaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a new Taxonomy is added.

```
public virtual void OnAfterAdd(Ektron.Cms.TaxonomyData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAssignItem(Ektron.Cms.TaxonomyRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Taxonomy Item is added/assigned to Taxonomy.

```
public virtual void OnAfterAssignItem(Ektron.Cms.TaxonomyRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAssignItem(Ektron.Cms.TaxonomySyncRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterAssignItem(Ektron.Cms.TaxonomySyncRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterCopy(long, long, int, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after an item is added to a taxonomy node.

```
public virtual void OnAfterCopy(long sourceId, long newId,
  int languageId, bool deleteSource,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after Taxonomy is deleted.

```
public virtual void OnAfterDelete(long id, int languageId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterRemoveItem(Ektron.Cms.TaxonomyRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after an item is removed from a taxonomy node.

```
public virtual void OnAfterRemoveItem(Ektron.Cms.TaxonomyRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterRemoveItem(Ektron.Cms.TaxonomySyncRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after an item is removed from a taxonomy node.

```
public virtual void OnAfterRemoveItem(Ektron.Cms.TaxonomySyncRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.TaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Taxonomy is updated.

```
public virtual void OnAfterUpdate(Ektron.Cms.TaxonomyData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.TaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a new Taxonomy is added.

```
public virtual void OnBeforeAdd(Ektron.Cms.TaxonomyData taxonomyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAssignItem(Ektron.Cms.TaxonomyRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before Taxonomy item is added/assigned to Taxonomy.

```
public virtual void OnBeforeAssignItem(Ektron.Cms.TaxonomyRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAssignItem(Ektron.Cms.TaxonomySyncRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before an item is added to a taxonomy node.

```
public virtual void OnBeforeAssignItem(Ektron.Cms.TaxonomySyncRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeCopy(long, long, int, bool, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a taxonomy node is copied.

```
public virtual void OnBeforeCopy(long sourceId, long destinationId,
  int languageId, bool deleteSource,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Taxonomy is deleted.

```
public virtual void OnBeforeDelete(long id, int languageId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeRemoveItem(Ektron.Cms.TaxonomyRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called before an item is removed from a taxonomy node.

```
public virtual void OnBeforeRemoveItem(Ektron.Cms.TaxonomyRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeRemoveItem(Ektron.Cms.TaxonomySyncRequest, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before an item is removed from a taxonomy node.

```
public virtual void OnBeforeRemoveItem(Ektron.Cms.TaxonomySyncRequest
  request, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.TaxonomyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Taxonomy is updated.

```
public virtual void OnBeforeUpdate(Ektron.Cms.TaxonomyData
  taxonomyData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TaxonomyStrategy()`

  Summary: Constructor.

```
public TaxonomyStrategy()
```

TemplateStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddTemplate(Ektron.Cms.TemplateData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterAddTemplate(Ektron.Cms.TemplateData
  TemplateData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteTemplate(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterDeleteTemplate(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTemplate(Ektron.Cms.TemplateData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnAfterUpdateTemplate(
 Ektron.Cms.TemplateData TemplateData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddTemplate(Ektron.Cms.TemplateData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeAddTemplate(Ektron.Cms.TemplateData
  TemplateData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteTemplate(long, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeDeleteTemplate(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateTemplate(Ektron.Cms.TemplateData, Ektron.Cms.Extensibility.CmsEventArgs)`

```
public virtual void OnBeforeUpdateTemplate(Ektron.Cms.TemplateData
  TemplateData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TemplateStrategy()`

  Summary: Constructor.

```
public TemplateStrategy()
```

TodoListStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteTodoList(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a TodoList is deleted.

```
public virtual void OnAfterDeleteTodoList(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateTodoList(Ektron.Cms.ToDo.TodoListData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a TodoList is edited.

```
public virtual void OnAfterUpdateTodoList(Ektron.Cms.ToDo.TodoListData
  todoList, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `TodoListStrategy()`

  Summary: Constructor.

```
public TodoListStrategy()
```

UserCustomPropertyStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddUserCustomProperty(Ektron.Cms.UserCustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user custom property is added.

```
public virtual void OnAfterAddUserCustomProperty(
  Ektron.Cms.UserCustomPropertyData userCustomPropertyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteUserCustomProperty(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user custom property is deleted.

```
public virtual void OnAfterDeleteUserCustomProperty(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateUserCustomProperty (Ektron.Cms.UserCustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called after a user custom property is edited.

```
public virtual void OnAfterUpdateUserCustomProperty(
  Ektron.Cms.UserCustomPropertyData userCustomPropertyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddUserCustomProperty(Ektron.Cms.UserCustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user custom property is added.

```
public virtual void OnBeforeAddUserCustomProperty(
  Ektron.Cms.UserCustomPropertyData userCustomPropertyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteUserCustomProperty(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user custom property is deleted.

```
public virtual void OnBeforeDeleteUserCustomProperty(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateUserCustomProperty (Ektron.Cms.UserCustomPropertyData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user custom property is edited.

```
public virtual void OnBeforeUpdateUserCustomProperty(
  Ektron.Cms.UserCustomPropertyData userCustomPropertyData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `UserCustomPropertyStrategy()`

  Summary: Constructor.

```
public UserCustomPropertyStrategy()
```

UserGroupStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddUserGroup(Ektron.Cms.UserGroupData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user group is added.

```
public virtual void OnAfterAddUserGroup(Ektron.Cms.UserGroupData
  userGroupData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteUserGroup(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user group is deleted.

```
public virtual void OnAfterDeleteUserGroup(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateUserGroup(Ektron.Cms.UserGroupData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user group is edited.

```
public virtual void OnAfterUpdateUserGroup(Ektron.Cms.UserGroupData
  userGroupData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `UserGroupStrategy()`

  Summary: Constructor.

```
public UserGroupStrategy()
```

UserNotificationSettingStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a UserNotificationSettingData object is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate (Ektron.Cms.Notifications.UserNotificationSettingData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a UserNotificationSettingData object is edited.

```
public virtual void OnAfterUpdate(
  Ektron.Cms.Notifications.UserNotificationSettingData
  userNotificationSettingData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `UserNotificationSettingStrategy()`

  Summary: Constructor.

```
public UserNotificationSettingStrategy()
```

UserStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAddColleague(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a colleague/friend is added.

```
public virtual void OnAfterAddColleague(long userOneId, long userTwoId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAddUser(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a new user is added.

```
public virtual void OnAfterAddUser(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterColleagueRequest(Ektron.Cms.Community.ActionRequestData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called after a colleague/friend request is sent.

```
public virtual void OnAfterColleagueRequest(
  Ektron.Cms.Community.ActionRequestData invitationData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteColleague(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after two users' colleague relationship is deleted. There is no significance to the ordering of the users.

```
public virtual void OnAfterDeleteColleague(long userOneId,
  long userTwoId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDeleteUser(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user is deleted.

```
public virtual void OnAfterDeleteUser(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterLogin(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user logs in.

```
public virtual void OnAfterLogin(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterLogout(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user is logged out of the CMS.

```
public virtual void OnAfterLogout(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateUser(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user is updated.

```
public virtual void OnAfterUpdateUser(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUserAddInGroup(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user added in the group.

```
public virtual void OnAfterUserAddInGroup(long userId, long groupId,
 Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUserDeleteFromGroup(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a user deleted from group.

```
public virtual void OnAfterUserDeleteFromGroup(long userId,
  long groupId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddUser(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called before a new user is added to CMS.

```
public virtual void OnBeforeAddUser(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDeleteUser(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user is deleted from CMS.

```
public virtual void OnBeforeDeleteUser(long Id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeLogin(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user logs in.

```
public virtual void OnBeforeLogin(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeLogout(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user is logged out of the CMS.

```
public virtual void OnBeforeLogout(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdateUser(Ektron.Cms.UserData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user is updated.

```
public virtual void OnBeforeUpdateUser(Ektron.Cms.UserData userData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUserAddInGroup(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user add in to the group.

```
public virtual void OnBeforeUserAddInGroup(long userId, long groupId,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUserDeleteFromGroup(long, long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a user delete from group.

```
public virtual void OnBeforeUserDeleteFromGroup(long userId,
  long groupId, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `UserStrategy()`

  Summary: Constructor.

```
public UserStrategy()
```

WebEventStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterAdd(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

Summary: This method is called after a new Web calendar event is added.

```
public virtual void OnAfterAdd(Ektron.Cms.Common.Calendar.WebEventData
  eventData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterAddVariance(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Web calendar event variance is added.

```
public virtual void OnAfterAddVariance(
  Ektron.Cms.Common.Calendar.WebEventData
  eventData, Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterCancelOccurrence(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a single occurrence of Web calendar event (recursive event) is cancelled.

```
public virtual void OnAfterCancelOccurrence(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Web calendar event is deleted.

```
public virtual void OnAfterDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterPublish(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after publishing a webevent.

```
public virtual void OnAfterPublish(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdate(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called after a Web calendar event is updated.

```
public virtual void OnAfterUpdate(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAdd(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a new Web calendar event is added.

```
public virtual void OnBeforeAdd(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeAddVariance(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Web calendar event variance is added.

```
public virtual void OnBeforeAddVariance(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeCancelOccurrence(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a single occurrence of a Web calendar event (recursive event) is canceled.

```
public virtual void OnBeforeCancelOccurrence(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeDelete(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Web calendar event is deleted.

```
public virtual void OnBeforeDelete(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforePublish(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Web calendar event is published.

```
public virtual void OnBeforePublish(
  Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnBeforeUpdate(Ektron.Cms.Common.Calendar.WebEventData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: This method is called before a Web calendar event is updated.

```
public virtual void OnBeforeUpdate(
 Ektron.Cms.Common.Calendar.WebEventData eventData,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `WebEventStrategy()`

  Summary: Constructor.

```
public WebEventStrategy()
```

XmlConfigurationStrategy

Namespace: `Ektron.Cms.Extensibility`

- `OnAfterDeleteXmlConfiguration(long, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Executes a strategy method after an XML configuration was deleted.

```
public virtual void OnAfterDeleteXmlConfiguration(long id,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterPublishXmlConfiguration(XmlConfigData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Executes a strategy method after publishing an XML configuration.

```
public virtual void OnAfterPublishXmlConfiguration(XmlConfigData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateXmlConfiguration(XmlConfigData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Executes a strategy method after an XML configuration update.

```
public virtual void OnAfterUpdateXmlConfiguration(XmlConfigData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

- `OnAfterUpdateXmlIndex(XmlConfigData, Ektron.Cms.Extensibility.CmsEventArgs)`

  Summary: Executes a strategy method after updating index fields (2nd screen) while updating smart forms.

```
public virtual void OnAfterUpdateXmlIndex(XmlConfigData data,
  Ektron.Cms.Extensibility.CmsEventArgs eventArgs)
```

Programmatically canceling strategies

Strategies called before actions take place in the system, such as `BasketStrategy.OnBeforeBasketDelete`, are provided CancellableEventArgs instead of CmsEventArgs. By setting the `CancellableEventArgs.IsCancelled` property to **true**, the current action is not performed, and the message you specify in `CancellableEventArgs.CancellationMessage` is returned to the user.

Wizard to generate Ektron event handlers in Visual Studio

By installing the `Ektron.Addin.Strategy` extension into Visual Studio, you can use a wizard to choose Ektron Strategies to subscribe to. When finished, the wizard creates a strategy skeleton subscribed to the selected events and adds it to the `objectFactory.config` file so the site uses it.

User and content constants

You can use the following information to determine constant values when working with Ektron users and content.

User constants

- Builtin: 999999999
- Internal Admin: 18611864
- Image: 1
- File: 2
- AllMemberShip Group: 888888
- Everyone Group: 2
- Admin Group: 1

Content constants

- Archive_ManagedAsset_Min: 1100
- Archive_ManagedAsset_Max: 2099
- CMSContentType_AllTypes: -1
- CMSContentType_Archive_Content: 3
- CMSContentType_Archive_Forms: 4
- CMSContentType_Archive_Media: 12
- CMSContentType_Asset: 103
- CMSContentType_BlogComments: 13
- CMSContentType_Content: 1
- CMSContentType_CatalogEntry: 3333
- CMSContentType_DiscussionTopic: 1111
- CMSContentType_Forms: 2
- CMSContentType_Image: 106
- CMSContentType_Library: 7
- CMSContentType_Media: 104
- CMSContentType_NonImageLibrary: 9
- CMSContentType_NonLibraryForms: 98
- CMSContentType_NonLibraryContent: 99
- CMSContentType_OfficeDoc: 101
- CMSContentType_PDF: 102
- CMSContentType_XmlConfig: 14
- ManagedAsset_Max: 1099
- ManagedAsset_Min: 100
- MaxNumManagedAssetTypes: 1000

Ektron Markup Language

The Ektron Markup Language (EkML) makes it easy for Web developers to manage the output presentation of server controls. EkML uses a simple markup that resembles HTML in syntax. The EkML is cached and .NET watches for file changes.

The `MarkupLanguage` property in the Ektron server controls and Ektron Dreamweaver functions is used to select the template file that contains the Ektron Markup Language. This language is made up of tags and variables that assign formatting information to a control or function when displayed on a Web page.

EkML templates

Ektron provides an EkML template for many server controls. The templates are located in *siteroot*`/Workarea/Templates`. At the top of each template is a list of variables that can be used with that control.

The default file follows this pattern: `\`*siteroot*`\Workarea\template\`*this object*`\`*objectname*`.ekml`. For example, `\siteroot\Workarea\template\collection\collection.ekml`.

To customize the default .ekml file, copy it to a folder outside the `siteroot\workarea` folder and edit it. Next, in a server control's `MarkupLanguage` property, enter the path to that file relative to the site root folder.

collection.ekml

This file defines which items and information are included when displaying content item information in a collection using the *Collection* on page 2209 server control.

collection.ekml variables

- *[$CollectionDescription]* on page 2657. The collection's description.
- *[$CollectionTitle]* on page 2657. The collection's title.
- *[$Comment]* on page 2658. The content's comment information.
- *[$ContentId]* on page 2659. The content item's ID.
- *[$DateCreated]* on page 2659. The date the content was created.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$EditorFirstName]* on page 2662. The last editor's first name for a content item.
- *[$EditorLastName]* on page 2662. The last editor's last name for a content item.
- *[$FolderId]* on page 2665. The folder ID of a content item.
- *[$Html]* on page 2666. The HTML contained in the content item.
- *[$HyperLink]* on page 2666. Adds a hyperlink using the title of the content block as the text.
- *[$Image]* on page 2667. The path of the image defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image appears. For example: `<img src="[$Image]"/>`
- *[$ImageIcon]* on page 2667. An image icon for the content item. For example, if the content item is HTML, the () icon appears.

- *[$ImageThumbnail]* on page 2667. The path for the image's thumbnail defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, a thumbnail version of the image appears. For example: `<img src="[$ImageThumbnail]"/>`. See:
- *[$Index]* on page 2668. Serialize the content items in a numbered list.
- *[$ItemCount]* on page 2668. Total number of items in a list.
- *[$Language]* on page 2668. The language ID for the content item.
- *[$LinkTarget]* on page 2669. When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.
- *[$QuickLink]* on page 2672. The Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$SERVER_NAME]* on page 2675. The server name. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.
- *[$ShowBubble(width,height)]* on page 2677. Similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and lets you set the width of the bubble.
- *[$ShowBubble]* on page 2676. Calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble.
- *[$ShowContent('htmltagid')]* on page 2677. Calls the `<ekcontentinfo>` tags and places the information in those tags within the specified HTML tag ID. Replace the 'htmltagid' with the ID of the tag.
- *[$Status]* on page 2678. A content item's status.
- *[$Teaser]* on page 2678. The content item's summary information. If the item is an HTML form, this variable is *not* supported with this ekml file.
- *[$Title]* on page 2679. The content item's title.
- *[$UrlEncode('str')]* on page 2679. Encodes string information. This variable can be used to encode another EkML variable and place it in an email.
- *[$UrlParam('paramname')]* on page 2680. The value of a query string's parameter. For example, if the query string is `?id=27` and the variable is `[$UrlParam('id')]`, 27 appears.

contentlist.ekml

This file defines which items and information are included when displaying content item information in a content list using the *ContentList* on page 2336 server control.

listsummary.ekml

This file defines which items and information are included when displaying content item information in a list summary using the *ListSummary* on page 2451 server control.

ListSummary.ekml variables

- *[$Comment]* on page 2658. The content's comment information.
- *[$ContentId]* on page 2659. The content item's ID.
- *[$DateCreated]* on page 2659. The date the content was created.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$EditorFirstName]* on page 2662. The last editor's first name for a content item.
- *[$EditorLastName]* on page 2662. The last editor's last name for a content item.
- *[$FolderDescription]* on page 2664. The folder's description.
- *[$FolderId]* on page 2665. The folder ID of a content item.
- *[$FolderName]* on page 2665. The folder's name.
- *[$Html]* on page 2666. The HTML contained in the content item.
- *[$HyperLink]* on page 2666. Adds a hyperlink using the title of the content block as the text.
- *[$Image]* on page 2667. The path for the image defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image appears. For example: `<img src="[$Image]"/>`
- *[$ImageIcon]* on page 2667. An image icon for the content item. For example, if the content item is HTML, the () icon appears.
- *[$ImageThumbnail]* on page 2667. The path for the image's thumbnail defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, a thumbnail version of the image appears. For example: `<img src="[$ImageThumbnail]"/>`
- *[$Index]* on page 2668. Serialize the content items in a numbered list.
- *[$ItemCount]* on page 2668. The total number of items in a list.
- *[$Language]* on page 2668. The language ID for the content item.
- *[$LinkTarget]* on page 2669. When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.
- *[$QuickLink]* on page 2672. Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$SERVER_NAME]* on page 2675. The server name. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.
- *[$ShowBubble(width,height)]* on page 2677. Similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and lets you set the width of the bubble.
- *[$ShowBubble]* on page 2676. Calls `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble.
- *[$ShowContent('htmltagid')]* on page 2677. Calls the `<ekcontentinfo>` tags and places information in those tags within the specified HTML tag ID. Replace the 'htmltagid' with the ID of the tag.
- *[$Status]* on page 2678. The status of a content item.
- *[$Teaser]* on page 2678. The content item's summary information. If the item is an HTML form, this variable is *not* supported with this ekml file.

- *[$Title]* on page 2679 the content item's title.
- *[$UrlEncode('str')]* on page 2679. Encodes the string information. This variable can be used to encode another EkML variable and place it in an email.
- *[$UrlParam('paramname')]* on page 2680. The value of a QueryString's parameter. For example, if the QueryString is `?id=27` and the variable is `[$UrlParam('id')]`, 27 appears.

map.ekml

The `map.ekml` file defines which items and information are included when using the *Map* on page 2463 server control. Unlike most other .ekml files, the `map.emkl` has some variables that cannot be changed or moved around.

The file's variables appear in 3 <tr></tr> table rows. These rows are located below the main table. In the first 2 table rows, you can modify a tag's style information only. In the third, you can change the style information and the order of the variables to create different layouts for your page. It is recommended you hide the first 2 table rows if you are not changing their style information. For example:

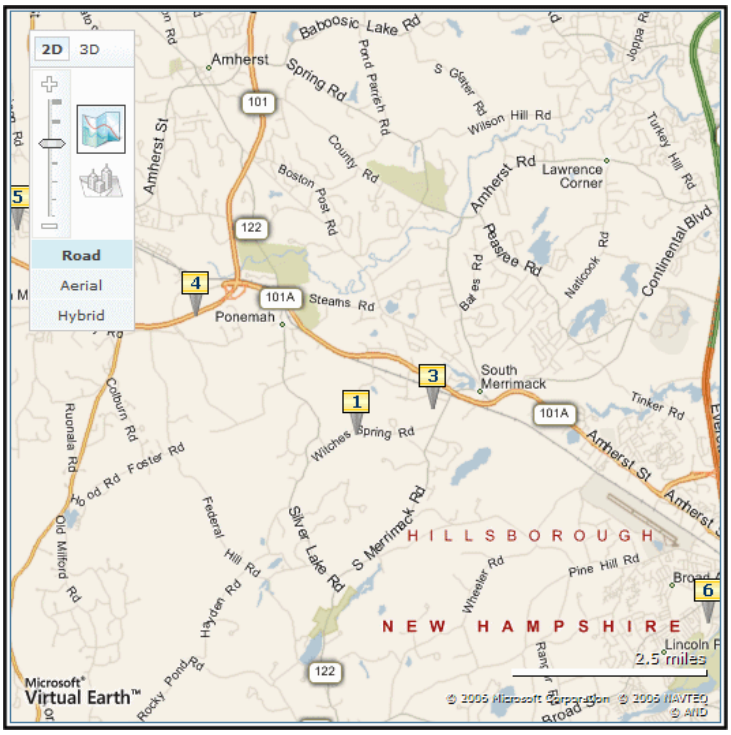
```
<ekmarkup>
  <ekoutput>
    <div>
      <table>
        <tr>...
        <tr>...
        <tr>
          <td>
            <table>
              <tr>
                <td>
                  <div id="__RouteInfoPane" style="display:
                </td>
                <td>
                  <div id="__Map" style="position:relative;
                </td>
                <td>
                  <div id="__SearchTxtResultPane" style="ov
                </td>
              </tr>
            </table>
          </td>
        </tr >
      </table>
    </div>
  </ekoutput>
</ekmarkup>
```

When using the map.ekml file remember these 3 rules.

1. Do not change any of the IDs.
2. You can change any tag's style information.
3. You can move the variables in the third table row around to create different layouts. For example, you can display these sections horizontally or vertically.

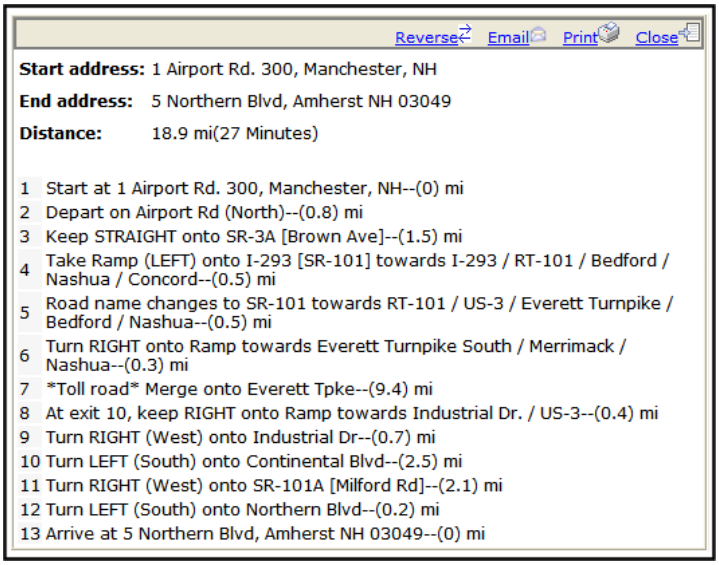
__Map

Displays the map section of the Map server control.



__RouteInfoPane

The panel that displays driving directions from the starting address to the arrival address.



Reverse Email Print Close

Start address: 1 Airport Rd. 300, Manchester, NH

End address: 5 Northern Blvd, Amherst NH 03049

Distance: 18.9 mi(27 Minutes)

1 Start at 1 Airport Rd. 300, Manchester, NH--(0) mi
2 Depart on Airport Rd (North)--(0.8) mi
3 Keep STRAIGHT onto SR-3A [Brown Ave]--(1.5) mi
4 Take Ramp (LEFT) onto I-293 [SR-101] towards I-293 / RT-101 / Bedford / Nashua / Concord--(0.5) mi

messageboard.ekml

This file defines which items and information are included when displaying message information for a message board using the *MessageBoard* on page 2270 server control.

messageboard.ekml variables

- *[$AddCommentBox]* on page 2654. The Add Comment text box and button for a message board.
- *[$ApproveMessageLink]* on page 2655. An Approve link to approve comments when message board moderation is active.
- *[$Avatar]* on page 2655. The profile image of the member who entered the comments on the message board.
- *[$DateCreated]* on page 2659. The date the content was created.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$DeleteMessageLink]* on page 2660. The Delete link for a comment on the message board. Only Administrators, the person who left the message or the person who owns the board.
- *[$DisplayName]* on page 2661. The display name of the member who left the message.
- *[$EmailAddress]* on page 2663. The email address of the member who left the message on the board.
- *[$FirstName]* on page 2664. The first name of the person who left the comment on the message board.
- *[$LastName]* on page 2669. The last name of the person who left the comment on the message board.
- *[$MessageText]* on page 2670. The message on a message board.
- *[$NumberComments]* on page 2670. The number of comments posted to a message board.

- *[$UserName]* on page 2681. The username of a user who left a comment on a message board.

metadatalist.ekml

This file defines which items and information are included when displaying content item information for a metadata list using the *MetadataList* on page 2503 server control.

metadatlist.ekml variables

- *[$Comment]* on page 2658. The content's comment information.
- *[$ContentId]* on page 2659. The content item's ID.
- *[$DateCreated]* on page 2659. The date the content was created.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$EditorFirstName]* on page 2662. The last editor's first name for a content item.
- *[$EditorLastName]* on page 2662. The last editor's last name for a content item.
- *[$FolderId]* on page 2665. The folder ID of a content item.
- *[$Html]* on page 2666. The HTML contained in the content item.
- *[$HyperLink]* on page 2666. Adds a hyperlink using the title of the content block as the text.
- *[$Image]* on page 2667. The path for the image defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image appears.
- *[$ImageIcon]* on page 2667. An image icon for the content item. For example, if the content item is HTML, the () icon appears.
- *[$ImageThumbnail]* on page 2667. The path for the image's thumbnail defined in a content item's Metadata.
- *[$Index]* on page 2668. Serialize the content items in a numbered list.
- *[$ItemCount]* on page 2668. Total number of items in a list.
- *[$Language]* on page 2668. Language ID for the content item.
- *[$LinkTarget]* on page 2669. When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.
- *[$QuickLink]* on page 2672. Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$SERVER_NAME]* on page 2675. The server name. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.
- *[$ShowBubble(width,height)]* on page 2677. Similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and lets you set the width of the bubble.
- *[$ShowBubble]* on page 2676. Calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble.

- *[$ShowContent('htmltagid')]* on page 2677. Calls the <ekcontentinfo> tags an places the information in those tags within the specified HTML tag ID. Replace the 'htmltagid' with the ID of the tag.
- *[$Status]* on page 2678. The status of a content item.
- *[$Teaser]* on page 2678. The content item's summary information. If the item is an HTML form, this variable is *not* supported with this ekml file.
- *[$Title]* on page 2679. The content item's title.
- *[$UrlEncode('str')]* on page 2679. Encodes the string information. This variable can be used to encode another EkML variable and place it in an email.
- *[$UrlParam('paramname')]* on page 2680. The value of a QueryString's parameter. For example, if the QueryString is `?id=27` and the variable is `[$UrlParam('id')]`, 27 appears.

taxonomy.ekml

This file defines which items and information are included when displaying taxonomy item information using the *Directory* on page 2348 server control. Similar to `maps.ekml`, `taxonomy.ekml` works differently than other .ekml files.

The Directory server control produces multiple areas where content or functionality is defined. To specify these areas in a template, you would call the `<ekoutput>` tag with the mode attribute equaling the area you want to define. For example, in the Directory server control, you can define information in the breadcrumb area of the server control by using `<ekoutput mode="breadcrumb">`.

Additional descriptions and commenting in the `taxonomy.ekml` file will assist you with learning about EkML with taxonomy.

Taxonomy <ekoutput> modes

The following <ekoutput modes=""> are used with the `taxonomy.ekml` template.

- `<ekoutput mode="breadcrumb">`. Defines the display of the breadcrumb portion of the taxonomy. Within these tags you can define:
  - `<bctitle>`. Title for the breadcrumbs
  - `<bcrootlink>`. Root link text
  - `<bcseparator>`. Separator used to between breadcrumbs in the breadcrumb trail
  - `<bchyperlink>`. Hyperlinks in the breadcrumb trail
  - `<bcactivelink>`. The current active breadcrumb item
- `<ekoutput mode="category">`. Defines how the category information appears. Within these tags you can define:
- `<ekcolrepeat>` takes the category links and spreads them over the amount of columns that are defined in the Directory server control's `TaxonomyCol` property. This tag must appear within `<ekrepeat>` tags.
- `<ekoutput mode="categorybacklink">`. Defines information about the link that moves the category up one level. This can be a text link or an image link. In this mode, you need to define the following tags:

- <ekactivebacklink> </ekactivebacklink>. Between these tags, define what appears when a user is in a sub category. Add the [$categorybacklink] variable between these tags and an clickable image appears that lets a user navigate one level up.
- <ekdisablebacklink> </ekdisablebacklink>. Between these tags, define what happens when a user is at the top level category. Add the [$categorybacklink] variable between these tags with an <a> tag have users navigate to another location. For example:

```
<a href="http://www.example.com" target="_blank">
[$categorybacklink]</a>
```

See also: *[$CategoryBackLink]* on page 2656

- `<ekoutput mode="article_search">`. Defines how the search results from the taxonomy are displayed.
- `<ekoutput mode="article">`. Defines the display of an individual content item in your taxonomy.
- `<ekoutput mode="view">`. This section defines the overall output view of the Taxonomy. It denotes the locations of the Search box, Breadcrumb, Category and Articles.

taxonomy.ekml variables

- *[$AddArticle]* on page 2653. Adds a link that allows a logged in user to add HTML content to Ektron.
- *[$AddAsset]* on page 2653. Adds a link that allows a logged in user to add assets to Ektron.
- *[$CategoryBackLink]* on page 2656. When placed between `<ekactivebacklink>` tags, this variable adds a clickable image that allows a user to navigate up one category level. When placed between `<ekdisablebacklink>` tags and in the text area of an `<a>` tag, this variable adds a clickable image that allows a user to navigate to another URL once they reach the top level category.
- [$CategoryID]. The ID of a taxonomy's category.
- *[$ContentByteSize]* on page 2659. The content item's size in KB. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$ContentId]* on page 2659. The content item's ID.
- *[$DateCreated]* on page 2659. The date the content was created.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$EditorFirstName]* on page 2662. The last editor's first name for a content item.

- *[$EditorLastName]* on page 2662. The last editor's last name for a content item.
- *[$FolderId]* on page 2665. The folder ID of a content item.
- *[$Html]* on page 2666. The HTML contained in the content item.
- *[$HyperLink]* on page 2666. Adds a hyperlink using the title of the content block as the text.
- *[$ImageIcon]* on page 2667. An image icon for the content item type. For example, if the content item is HTML, the () icon appears.
- *[$Index]* on page 2668. Serialize the content items in a numbered list.
- *[$ItemCount]* on page 2668. The total number of items in a list.
- *[$Language]* on page 2668. The language ID for the content item.
- *[$LinkTarget]* on page 2669. When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.
- *[$PagingCurrentEndIndex]* on page 2671. The end count number of the items on the page. For example, if you are displaying items 11-20 on a page, this variable represents the number 20. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$PagingCurrentStartIndex]* on page 2672. The numerical record of the first item on a page. For example, if you are displaying items 1 through 10 out of 50 total items on a page, this variable represents the number 1. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$QuickLink]* on page 2672. The Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$SearchDuration]* on page 2673. The amount of time, in seconds, it has taken to execute the search. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$SearchSummary]* on page 2674. Creates a summary from information stored in the indexing service for each item in the search results. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$SearchText]* on page 2674. The text for which a user is searching. This information is same as what a user entered in the search text box. Works only with taxonomy search. `<ekoutput mode="article_search">`
- *[$SERVER_NAME]* on page 2675. The server name. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.
- *[$ShowAllcategory]* on page 2675. Adds to the Taxonomy search screen a checkbox that lets the user decide whether to display categories that have no items.
- *[$ShowBubble]* on page 2676. Calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble.
- *[$ShowBubble(width,height)]* on page 2677. Similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and lets you set the width of the bubble.

- *[$ShowContent('htmltagid')]* on page 2677. Calls the <ekcontentinfo> tags an places the information in those tags within the specified HTML tag ID. Replace the 'htmltagid' with the ID of the tag.
- *[$Status]* on page 2678. The status of a content item.
- *[$Teaser]* on page 2678. The content item's summary information. If the item is an HTML form, this variable is *not* supported with this ekml file.
- *[$TemplateQuickLink]* on page 2679. The Template Quicklink information assigned to the taxonomy item in the Workarea. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$Title]* on page 2679. The content item's title.
- *[$UrlEncode('str')]* on page 2679. Encodes the string information. This variable can be used to encode another EkML variable and place it in an email.
- *[$UrlParam('paramname')]* on page 2680. The value of a QueryString's parameter. For example, if the QueryString is `?id=27` and the variable is `[$UrlParam('id')]code, 27 appears.`

websearch.ekml

This file defines which items and information are included when displaying search results using the WebSearch server control.

IMPORTANT: Deprecated. The WebSearch server control is deprecated as of Release 8.50. Instead of the WebSearch control, you should convert to templated search. If you are already using the WebSearch server control, you can continue to do so with one important exception: the Solr search provider is incompatible with the WebSearch server control.

The `websearch.ekml` template needs 2 `<ekoutput>` nodes.

- The first `<ekoutput>` node formats the results of non-image searches
- The second `<ekoutput>` node formats results that include images

websearch.ekml variables

- *[$ContentByteSize]* on page 2659. The size of the content item.
- *[$ContentId]* on page 2659. The content ID number assigned to the content.
- *[$DateModified]* on page 2660. The date the content was last modified.
- *[$EditorFirstName]* on page 2662. The last editor's first name for a content item.
- *[$EditorLastName]* on page 2662. The last editor's last name for a content item.
- *[$Image]* on page 2667. The path for the image defined in a content item's Metadata. When wrapped in `<img src="" />` tag, the image appears.
- *[$ImageIcon]* on page 2667. Used in non-image searches to display an image icon for the content item. For example, if the content item is HTML, the () icon appears.
- *[$ImageThumbnail]* on page 2667. The path for the image's thumbnail defined in a content item's Metadata.
- *[$ItemCount]* on page 2668. The total number of results produced by the search.

- *[$LinkTarget]* on page 2669. When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.
- *[$PagingCurrentEndIndex]* on page 2671. The end count number of the items on the page. For example, if you are displaying items 11-20 on a page, this variable represents the number 20.
- *[$PagingCurrentStartIndex]* on page 2672. The numerical record of the first item on a page. For example, if you are displaying items 1 through 10 out of 50 total items on a page, this variable represents the number 1.
- *[$QuickLink]* on page 2672. The Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.
- *[$SearchDuration]* on page 2673. The amount of time, in seconds, it has taken to execute the search.
- *[$SearchSummary]* on page 2674. Creates an abstract for each item in the search results.

  NOTE: The Adobe IFilter, which is used to generate the abstract, is only supported in Tier 1 languages (English, French, German, and Japanese). If your website uses other languages, the abstract may not be legible. In such a case, you should suppress the abstract from the search results.

- *[$SearchText]* on page 2674. The text for which a user is searching. This information is same as what a user entered in the search text box.
- *[$ShortDateModified]* on page 2675. The date the content was modified. To display the date and time a content item was modified, use *[$DateModified]* on page 2660.
- *[$Title]* on page 2679. The content item's title.

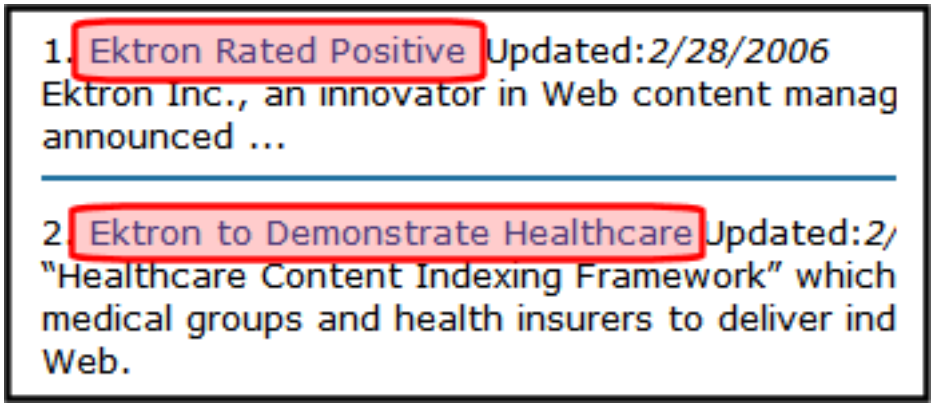
EkML example

By customizing the provided EkML templates, you can create a custom layout for the content you are displaying. For example, if you have a collection and you want to display it as a numbered list containing a content's hyperlink, the date it was last updated and its summary, you would create the following .ekml file and assign that file to a Collection server control's `MarkupLanguage` property.

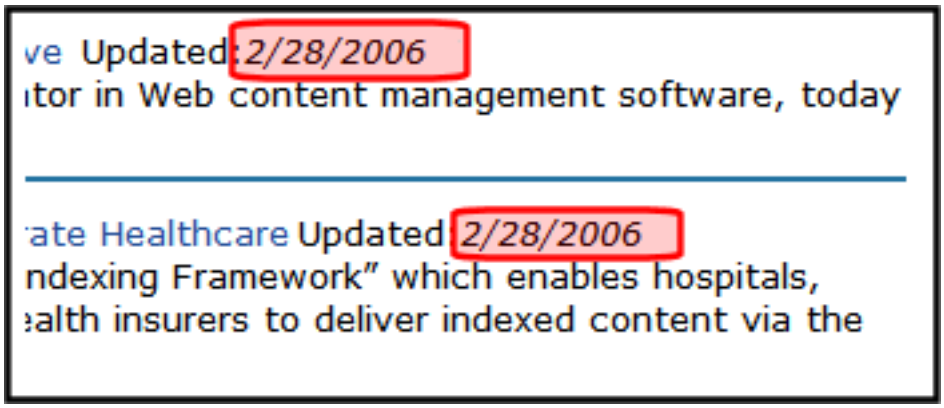
```
<ekmarkup>
  <ekoutput>
  <table width="100%"  border="0">
  <ekrepeat>
  <tr>
  <td> [$Index]. [$HyperLink] Updated:<i>[$DateModified]</i><br/>[$Teaser]
<hr/>
  </td>
  </tr>
  </ekrepeat>
  </table>
  </ekoutput>
</ekmarkup>
```

- The `<ekmarkup>` tags open and close the markup language. Everything to do with the EkML needs to be between these tags.
- The specific information you want displayed and any HTML formatting are added between the `<ekoutput>` tags.
- `<table width="100%" border="0"></table>` sets up a table. This is HTML formatting.
- The `<ekrepeat>` tags contain formatting information and variables for items in the Collection. It repeats this information for each item in the list.
- The `[$Index]` variable creates a numbered list for each content item in the Collection. Note, you can add a period (.) or other separator depending on how you want the list to look.

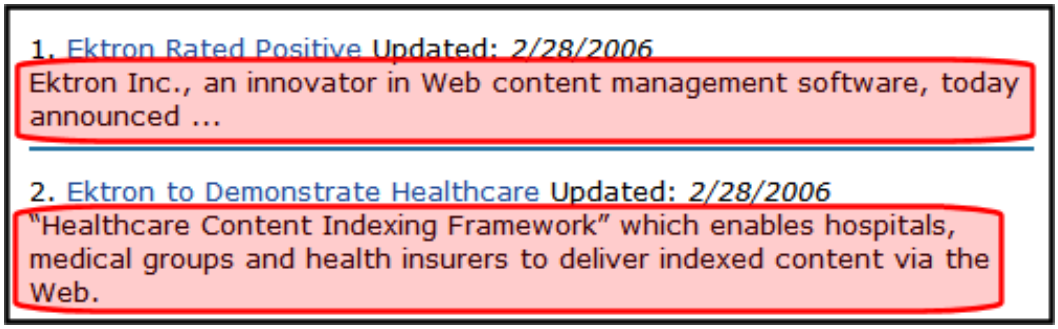
- The `[$HyperLink]` variable adds a hyperlink for each content item in the collection. The hyperlink use the content's title as the text for the link. There is no need for anchor tags, the variable creates them for you. If you want to use anchor tags for formatting you own links, you can use the `[$QuickLink]` variable.



- `Updated:` is plain text.
- The `<i></i>` tags are HTML that cause the `[$DateModified]` variable to appear in italics.
- The `[$DateModified]` variable displays the date and time each content item in the Collection was last modified.

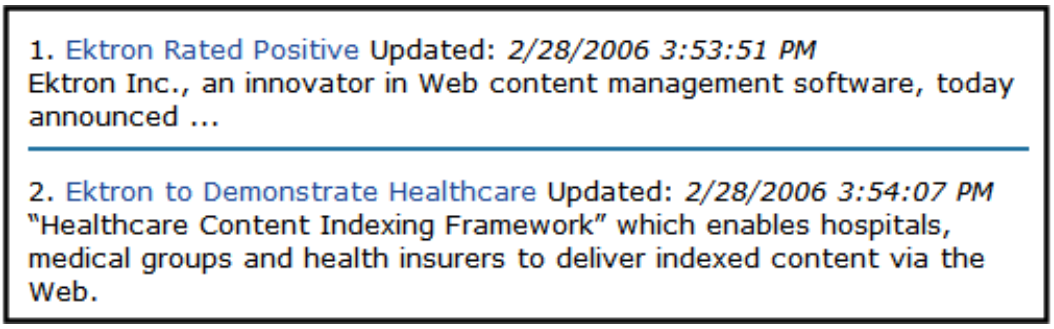


- `<br/>` is HTML. It adds a line break.
- The `[$Teaser]` variable displays the summary for each content item in the Collection.



- `<hr/>` is HTML. It adds a horizontal rule line.

When the Collection appears, it is formatted as follows.



Because you can use HTML in the Ektron Markup Language, you can format the variables using common HTML tags.

EkML tags

The EkML tags define functions that occur when using the language to display content.

- **<ekmarkup>**. Use these tags to open and close the Ektron Markup Language.
- **<ekoutput>**. Define what information is output from the server control between these tags.

- **<ekrepeat>**. These tags cause what ever formatting information that appears between them to be applied to each item in the list. They always appear between the `<ekoutput>` tags.
- **<ekbubbleinfo>**. Creates a pop-up bubble. This tag is invoked when you use the `[$ShowBubble]` or `[$ShowBubble(width)]` variables. By adding different variables between the `<ekbubbleinfo>` tags, you define what information appears in the bubble. These tags are placed outside the `<ekoutput>` tags but within the `<ekmarkup>` tags.
- **<ekcontentinfo>**. Places the information defined between the tags in the specified HTML tag ID. This tag is invoked when you use the `[$ShowContent('htmltagid')]` variable.

EkML variables

The Ektron Markup Language uses variables that appear between the tags in a template file to define the information that appears in a control's display. Some variable are used in more than one template. These are known as common EkML variables.

Another type of variable is a server control specific variable, these variables can only be used with a specific server control. For example, `[$SearchSummary]` can only be used in WebSearch.

EkML variable list

The following list shows EkML variables and whether the variable is common or specific.

Variable	Description	Common or Control Specific
[$AddCommentBox] on page 2654	Displays the Add Comment text box and button for a message board.	MessageBoard
[$AddArticle] on page 2653	Adds a link that allows a logged in user to add HTML content to Ektron.	Directory
[$AddAsset] on page 2653	Adds a link that allows a logged in user to add assets to Ektron.	Directory
[$ApproveMessageLink] on page 2655	Displays an Approve link to approve comments when message board moderation is active.	MessageBoard
[$Avatar] on page 2655	Displays the profile image of the member who entered comments on a message board.	MessageBoard

Variable	Description	Common or Control Specific
[$CollectionDescription] on page 2657	Displays the collection's description.	Collection
[$CollectionTitle] on page 2657	Displays the collection's title.	Collection
[$Comment] on page 2658	The content's comment information appears.	Common Except: Map, WebSearch and taxonomy
[$ContentByteSize] on page 2659	Displays the content item's size in KB. Works only with taxonomy search. `<ekoutput mode="article_search">`. More information	Directory WebSearch
[$ContentId] on page 2659	Displays the content item's ID.	Common Except: Map
[$DateCreated] on page 2659	Displays the date the content was created.	Common Except: Map and WebSearch
[$DateModified] on page 2660	Displays the date and time the content was last modified.	Common Except: Map
[$DeleteMessageLink] on page 2660	Displays the Delete link for the comment on a message board.	MessageBoard
[$DisplayName] on page 2661	Displays the display name of the member who left the message on the board.	MessageBoard
[$EditorFirstName] on page 2662	Displays the last editor's first name for a content item.	Common Except: Map
[$EditorLastName] on page 2662	Displays the last editor's last name for a content item. 1	Common Except: Map
[$EmailAddress] on page 2663	Displays the email address of the member.	MessageBoard
[$FirstName] on page 2664	Displays the first name of the person who left the comment on a message board.	MessageBoard

Variable	Description	Common or Control Specific
[$FolderDescription] on page 2664	Displays the folder's description.	ListSummary
[$FolderId] on page 2665	Displays the folder ID of a content item.	Common Except: Map and WebSearch
[$FolderName] on page 2665	Displays the folder's name.	ListSummary
[$Html] on page 2666	Displays the HTML contained in the content item. "	Common Except: Map and WebSearch
[$HyperLink] on page 2666	Adds a hyperlink using the title of the content block as the text. More information:	Common Except: Map and WebSearch
[$Image] on page 2667	Displays the path for the image defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image appears. For example: `<img src="[$Image]"/>`.	Common Except: Map
[$ImageIcon] on page 2667	Displays an image icon for the content item. For example, if the content item is HTML, the () icon appears.	Common Except: Map
[$ImageThumbnail] on page 2667	Displays the path for the image's thumbnail defined in a content item's Metadata. When wrapperd in `<img src=""/>` tag, a thumbnail version of the image appears. For example: `<img src="[$ImageThumbnail]"/>`.	Common Except: Map
[$Index] on page 2668	Serialize the content items in a numbered list.	Common Except: Map and WebSearch
[$ItemCount] on page 2668	The total number of items in a list.	Common Except: Map

Variable	Description	Common or Control Specific
[$Language] on page 2668	Displays the language ID for the content item.	Common Except: Map and WebSearch
[$LastName] on page 2669	Displays the last name of the person who left the comment on a message board.]	MessageBoard
[$LinkTarget] on page 2669	When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting.	Common Except: Map
[$MessageText] on page 2670	Displays the text of a message on a message board.	MessageBoard
[$NumberComments] on page 2670	Displays the number of comments posted to a message board.	MessageBoard
[$PagingCurrentEndIndex] on page 2671	The end count number of the items on the page. For example, if you are displaying items 11-20 on a page, this variable represents the number 20. Works only with taxonomy search. `<ekoutput mode="article_search">`.	Directory and WebSearch
[$PagingCurrentStartIndex] on page 2672	The numerical record of the first item on a page. For example, if you are displaying items 1 through 10 out of 50 total items on a page, this variable represents the number 1. Works only with taxonomy search. `<ekoutput mode="article_search">`.	Directory and WebSearch
[$QuickLink] on page 2672	Displays the Quicklink information for the content item. When wrapped in an `<a href="">` tag, you can create a Hyperlink.	Common Except: Map
[$SearchDuration] on page 2673	Displays the amount of time, in seconds, it has taken to execute the search. Works only with taxonomy search. `<ekoutput mode="article_search">`. More information:	Directory and WebSearch

Variable	Description	Common or Control Specific
[$SearchSummary] on page 2674	Creates a summary for each item in the search results. Works only with taxonomy search. `<ekoutput mode="article_search">`.	Directory and WebSearch
[$SearchText] on page 2674	Displays the text for which a user is searching. This information is same as what a user entered in the search text box. Works only with taxonomy search. `<ekoutput mode="article_search">`.	Directory and WebSearch
[$SERVER_NAME] on page 2675	Displays the server name. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.	Common Except: Map and WebSearch
[$ShortDateModified] on page 2675	Displays the date the content was modified. To display the date and time a content item was updated, use *[$DateModified]* on page 2660	WebSearch
[$ShowAllcategory] on page 2675	Adds to the Taxonomy search screen a checkbox that lets the user decide whether to display categories that have no items.	Directory
[$ShowBubble(width,height)] on page 2677	This is similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and lets you set the width and height of the bubble. For example, [$ShowBubble(300,400)]. The first number represents the width. The second number represents the height.	Common Except: Map and WebSearch
[$ShowBubble] on page 2676	Calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble.	Common Except: Map and WebSearch
[$ShowContent('htmltagid')] on page 2677	Calls the `<ekcontentinfo>` tags an places the information in those tags within the specified HTML tag ID. Replace the htmltagid with the ID of the tag.	Common Except: Map and WebSearch
[$Status] on page 2678	Displays the status of a content item.	Common Except: Map and WebSearch

Variable	Description	Common or Control Specific
[$Teaser] on page 2678	Displays the content item's summary information. **NOTE:** If the item is an HTML form, this variable is *not* supported with this ekml file.	Common Except: Map and WebSearch
[$TemplateQuickLink] on page 2679	the Template Quicklink information assigned to the taxonomy item in the Workarea. When wrapped in an `<a href="">` tag, you can create a Hyperlink. See also: Creating a Taxonomy-based Search on a Web page. More information :	Directory
[$Title] on page 2679	Displays the content item's title.	Common Except: Map
[$UrlEncode('str')] on page 2679	Encodes the string information. Replace **str** with the string you want to encode. This variable can be used to encode another EkML variable and place it in an email.	Common Except: Map and WebSearch
[$UrlParam('paramname')] on page 2680	Displays the value of a query string's given parameter. For example, if the query string is `?id=27` and the variable is `[$UrlParam ('id')], 27 appears.`	Common Except: Map and WebSearch
[$UserName] on page 2681	Displays the Username of user who left a comment on a message board.	MessageBoard

[$AddArticle]

This variable adds a link that allows a user to add HTML content to Ektron. Clicking the link opens an editor. When the content is added, it's automatically added to the taxonomy category associated with the Directory server control. When you allow users to add content using this variable, you should set the `AddItemFolderID` property in the Directory server control to the folder ID where the content will be stored. This variable should not be added between the <ekrepeat></ekrepeat> tags.

```
<tr>
  <td>
    [$AddArticle]
  </td>
</tr>
```

[$AddAsset]

This variable adds a link that allows a user to add assets to Ektron via a drag and drop box. When the asset is added, it's automatically added to the taxonomy category associated with the Directory server control. When you allow users to add assets using this variable, you should set the `AddItemFolderID` property in the Directory server control to the folder ID where the asset will be stored. This variable should not be added between the <ekrepeat></ekrepeat> tags.

```
<tr>
  <td>
    [$AddAsset]
  </td>
</tr>
```

[$AddCommentBox]

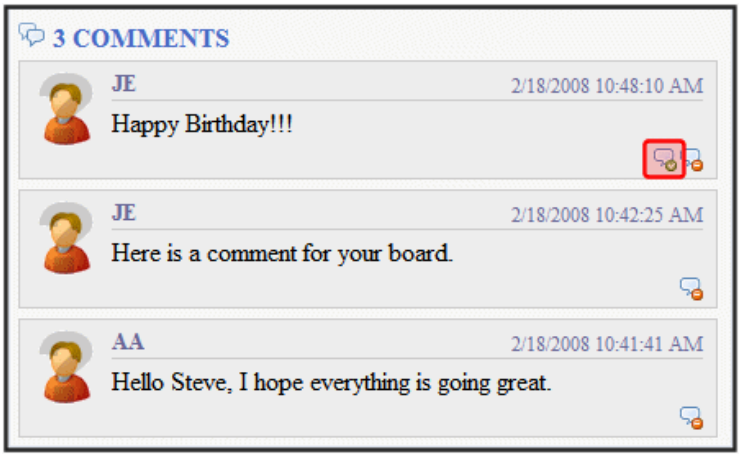
Displays the Add Comment text box and button for a message board.

```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
[$AddCommentBox]
```

```
  </div>
</ekoutput>
```

[$ApproveMessageLink]

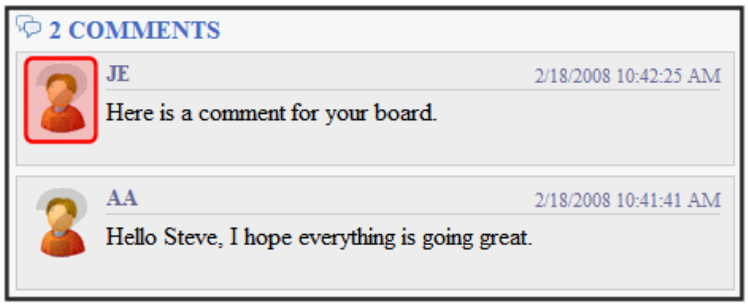
Displays the Approve link for the message. This link is used to approve the message for display when the `Moderate` property is set to true. Only Administrators, the person who left the message, or the person who owns the board can see this link.



```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
</ekoutput>
```

[$Avatar]

Display the profile image of the member who entered the comments on the message board.



```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
</ekoutput>
```

[$CategoryBackLink]

When placed between <ekactivebacklink> tags, this variable adds a clickable image that allows a user to navigate up one category level.

When placed between <ekdisablebacklink> tags and in the text area of an <a> tag, this variable adds a clickable image that lets a user navigate to another URL once they reach the top level category.

```
<ekoutput mode="categorybacklink">
  <ekactivebacklink>
    [$categorybacklink]
  </ekactivebacklink>
    <ekdisablebacklink>
    <a href="http://www.example.com" target="_blank">[$categorybacklink]</a>
    </ekdisablebacklink>
</ekoutput>
```

[$CollectionDescription]

Display the collection's description.

```
<ekmarkup>
<ekoutput>
<h3><b>[$CollectionTitle]</b></h3>
  <p/>[$CollectionDescription]<br/>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
            [$Index]. [$HyperLink]
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$CollectionTitle]

Display the collection's title.

```
<ekmarkup>
  <ekoutput>
    <h3><b>[$CollectionTitle]</b></h3>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
            [$Index]. [$HyperLink]
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

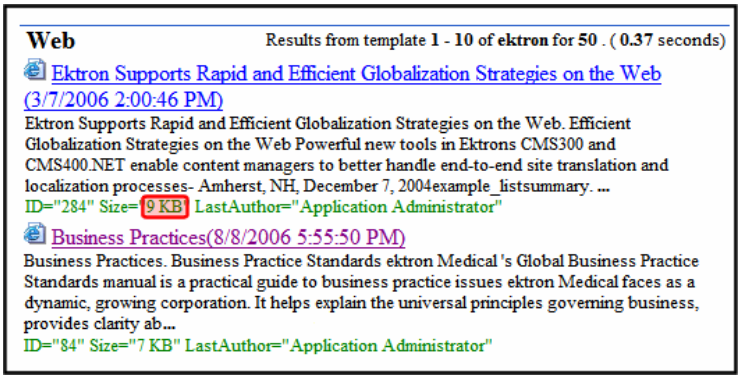
[$Comment]

The content's comment information appears. Comment information can be added in the Workarea via the content item's Comment tab.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] <br/> [$Comment]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

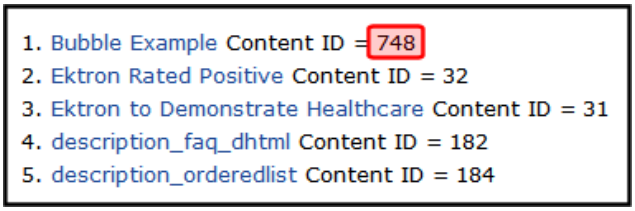
[$ContentByteSize]

Display the size of the content item in the results list.



[$ContentId]

Displays the content item's ID.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] Content ID = [$ContentId]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

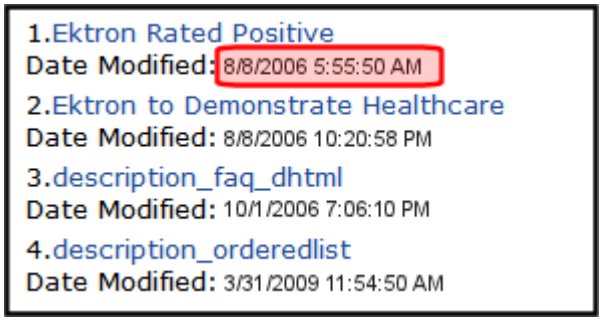
[$DateCreated]

Displays the date the content was created.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] - <i>[$DateCreated]</i>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$DateModified]

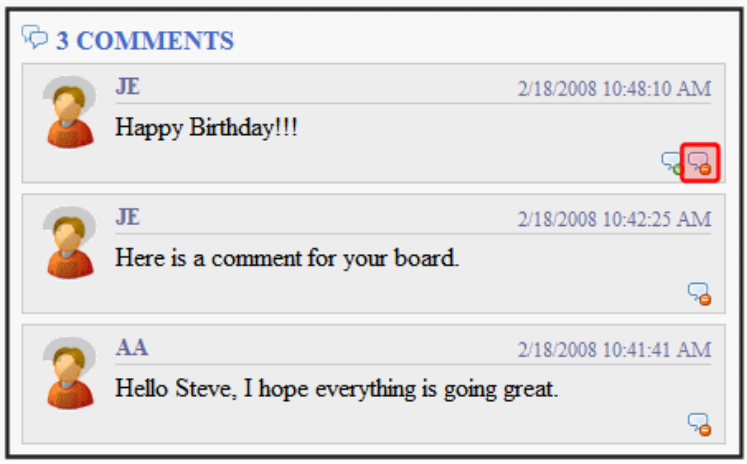
Displays the date and time the content was last modified. To display the date only, use *[$ShortDateModified]* on page 2675.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] <br/>Date Modified: <b>[$DateModified]</b>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$DeleteMessageLink]

Displays the Delete link for a comment on the message board. Only Administrators, the person who left the message or the person who owns the board.



```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
</ekoutput>
```

[$DisplayName]

Displays the display name of the member who left the message.

```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$DisplayName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
</ekoutput>
```

[$EditorFirstName]

Displays the last editor's first name for a content item.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] Last Editor: [$EditorFirstName]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$EditorLastName]

Displays the last editor's last name for a content item.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] Last Editor: [$EditorLastName]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$EmailAddress]

Displays the email address of the member who left the message on the board. To create a hyperlinked email, wrap the [$EmailAddress] variable in a <a> tag with the mailto: variable. For example:

```
<a href="Mailto:[$EmailAddress]">[$EmailAddress]</a>
```

```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]  
              <a href="Mailto:[$EmailAddress]">[$EmailAddress]</a>
            </span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>

```
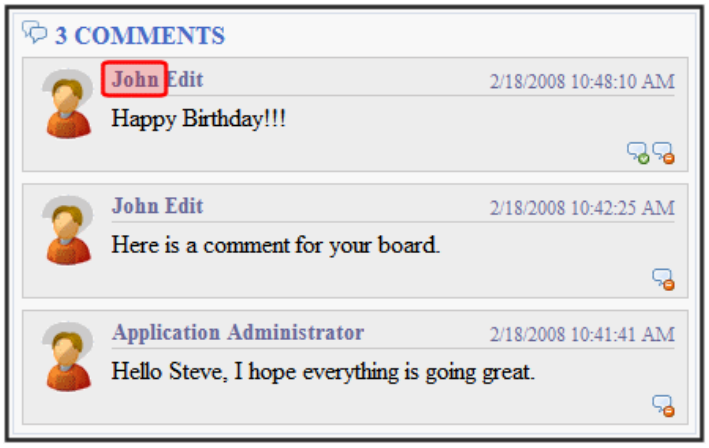
            <li class="ekApproveMessage">[$ApproveMessageLink]</li>
          </ul>
        </div>
      </li>
    </ekrepeat>
  </ul>
  [$AddCommentBox]
 </div>
</ekoutput>
```

[$FirstName]

Displays the first name of the user who left a comment on a message board.



```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$FirstName] [$LastName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
 </ekoutput>
```

[$FolderDescription]

Displays the folder's description.

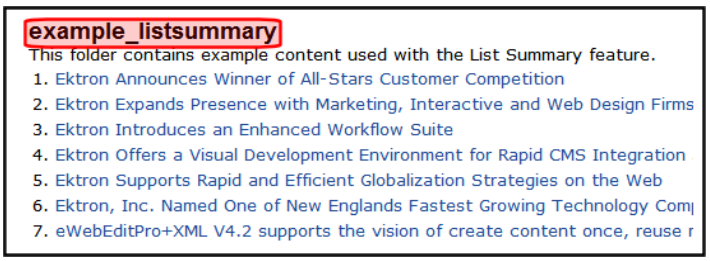
```
<ekmarkup>
  <ekoutput>
    <h3><b>[$FolderName]</b></h3><p/>[$FolderDescription]<br/>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
            [$Index]. [$HyperLink]
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$FolderId]

Displays the folder ID of a content item.

[$FolderName]

Displays the folder's name.

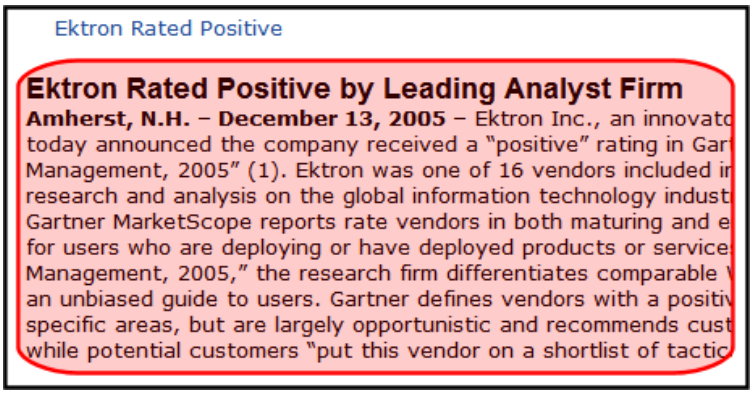


```
<ekmarkup>
  <ekoutput>
    <h3><b>[$FolderName]</b></h3><p/>[$FolderDescription]<br/>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
            [$Index]. [$HyperLink]
          </td>
        </tr>
      </ekrepeat>
    </table>
```

```
  </ekoutput>
</ekmarkup>
```

[$Html]

Displays the HTML contained in the content item. In the server control, the control's `GetHTML` property must be set to **True**; otherwise nothing appears. The exception to this is when the `[$Html]` appears between the `<ekbubbleinfo>` tags. In that case, the `GetHTML` property can be set to **True** or **False**.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$HyperLink]<br/>[$Html]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$HyperLink]

Adds a hyperlink using the title of the content block as the text. You do not add an `<a href="">` tag when using this variable. That functionality is built into the EkML. Use this variable when you do not want to create a custom hyperlink. If you want to create a custom hyperlink, use the `[$QuickLink]` variable. See also: *[$QuickLink]* on page 2672

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
```

```
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$Image]

Displays the path for the image defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image appears. For example, `<img src="[$Image]"/>`.

[$ImageIcon]

Displays an image icon for the content item. Except for HTML content, these icons are the same icons used in the Workarea to show the content type. HTML content uses the Internet Explorer icon (). For example, Forms use the Form icon ().

When using this variable with the server control, the `IncludeIcons` property is automatically set to **True**.

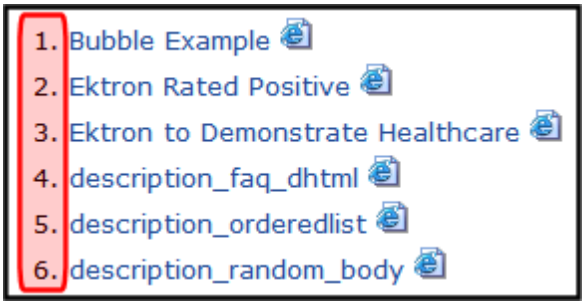
```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] [$ImageIcon]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$ImageThumbnail]

Displays the path for the image's thumbnail defined in a content item's Metadata. When wrapped in `<img src=""/>` tag, the image thumbnail appears. For example, `<img src="[$ImageThumbnail]"/>`.

[$Index]

Serialize the content items in a numbered list.



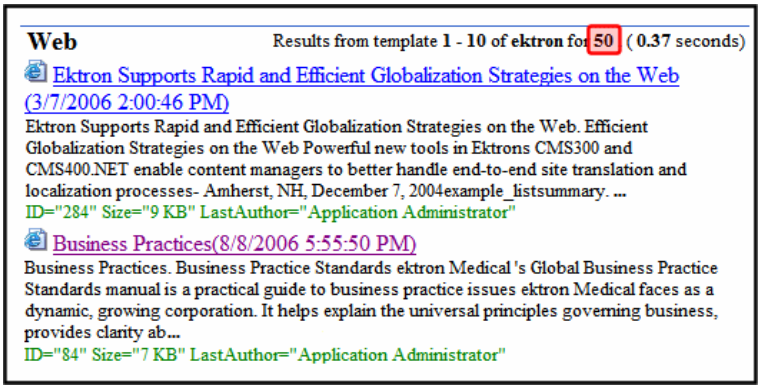
```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$HyperLink] [$ImageIcon]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$ItemCount]

Displays the total number of results in a list that are produced by the search. In the server control, the `EnablePaging` property must be set to **True**; otherwise nothing appears.

This variable is typically used in the following context:

Results `[$PagingCurrentStartIndex]`.`[$PagingCurrentEndIndex]` of **`[$ItemCount]`** for item `[$SearchText] ([$SearchDuration])`.



[$Language]

Displays the language ID for the content item.

[$LastName]

Displays the last name of the user who left a comment on a message board.

```
<ekoutput>
    <div class="ContributionForm">
      <h4>[$NumberComments] Comments</h4>
      <ul>
        <ekrepeat>
          <li class="ekMessagePost">
            <div class="avatar">[$Avatar]</div>
            <div class="message">
              <div class="metaData">
                <span class="username">[$FirstName] [$LastName]</span>
                <span class="time">[$DateCreated]</span>
              </div>
              <p>[$MessageText]</p>
              <ul class="commands">
                <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
                <li class="ekApproveMessage">[$ApproveMessageLink]</li>
              </ul>
            </div>
          </li>
        </ekrepeat>
      </ul>
      [$AddCommentBox]
    </div>
  </ekoutput>
```

[$LinkTarget]

When added to an `<a href="">` tag's `target=""` attribute, this variable reads the server control's `LinkTarget` property and uses its setting. For example, If you want to create a custom hyperlink that opens in a new window, you set the server control's `LinkTarget` property to `_Blank`. Then, in the Ektron Markup Language file, add the `[$LinkTarget]` variable to the `<a href="">` tag's `Taget=""` attribute. A code example appears below.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
```

```
      <ekrepeat>
      <tr>
        <td>
         <a href="[$QuickLink]" target="[$LinkTarget]">[$Title]</a>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$MessageText]

Displays the text of a message on a message board.

```
<ekoutput>
    <div class="ContributionForm">
      <h4>[$NumberComments] Comments</h4>
      <ul>
        <ekrepeat>
          <li class="ekMessagePost">
            <div class="avatar">[$Avatar]</div>
            <div class="message">
              <div class="metaData">
                <span class="username">[$UserName]</span>
                <span class="time">[$DateCreated]</span>
              </div>
              <p>[$MessageText]</p>
              <ul class="commands">
                <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
                <li class="ekApproveMessage">[$ApproveMessageLink]</li>
              </ul>
            </div>
          </li>
        </ekrepeat>
      </ul>
      [$AddCommentBox]
    </div>
  </ekoutput>
```

[$NumberComments]

Displays the number of comments posted on the message board.

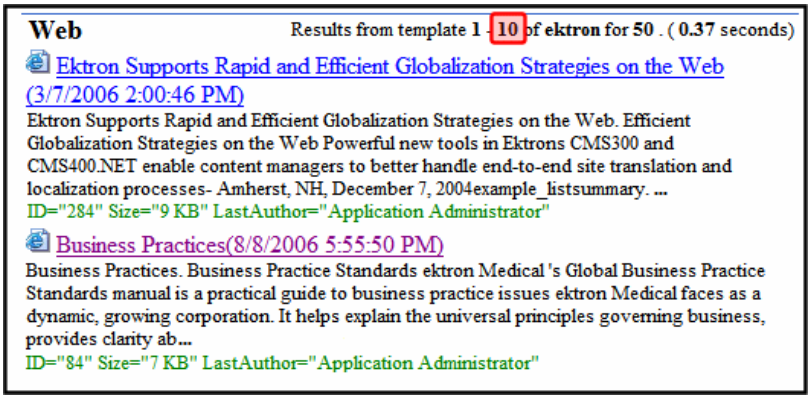
```
<ekoutput>
  <div class="ContributionForm">
    <h4>[$NumberComments] Comments</h4>
    <ul>
      <ekrepeat>
        <li class="ekMessagePost">
          <div class="avatar">[$Avatar]</div>
          <div class="message">
            <div class="metaData">
              <span class="username">[$UserName]</span>
              <span class="time">[$DateCreated]</span>
            </div>
            <p>[$MessageText]</p>
            <ul class="commands">
              <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
              <li class="ekApproveMessage">[$ApproveMessageLink]</li>
            </ul>
          </div>
        </li>
      </ekrepeat>
    </ul>
    [$AddCommentBox]
  </div>
</ekoutput>
```

[$PagingCurrentEndIndex]

The numerical record of the last item on a page. For example, if you are displaying items 1 through 10 out of 50 total items on a page, this variable represents the number 10.

This variable is typically used in the following context:

Results `[$PagingCurrentStartIndex]`. **`[$PagingCurrentEndIndex]`** of `[$ItemCount]` for item `[$SearchText] ([$SearchDuration])`.

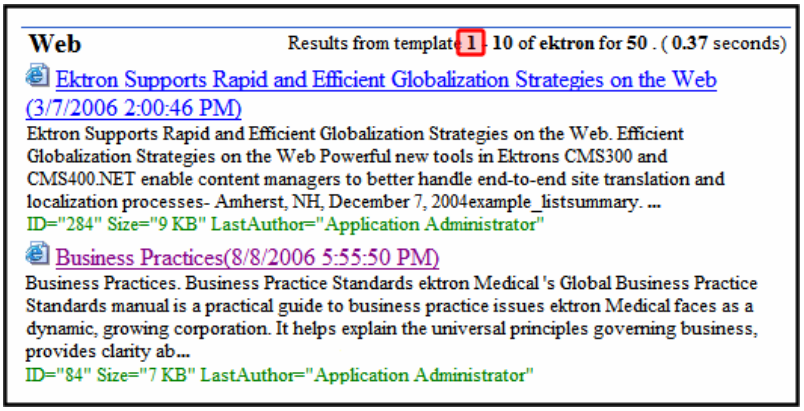


[$PagingCurrentStartIndex]

The numerical record of the first item on a page. For example, if you are displaying items 1 through 10 out of 50 total items on a page, this variable represents the number 1.

This variable is typically used in the following context:

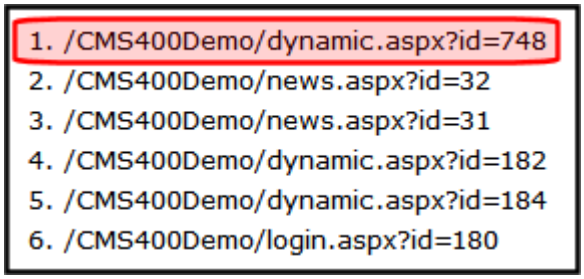
Results **[$PagingCurrentStartIndex]**. `[$PagingCurrentEndIndex]` of `[$ItemCount]` for item `[$SearchText] ([$SearchDuration])`.



[$QuickLink]

Displays the Quicklink information for the content item. When wrapped in an `<a href=””>` tag, you can create a Hyperlink. Use this property instead of the `[$HyperLink]` if you want to customize your hyperlinks. See also: *[$HyperLink]* on page 2666

The first image shows the variable displaying the Quicklink information. The second image shows the Quicklink as a Hyperlink with a custom text.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. [$QuickLink]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

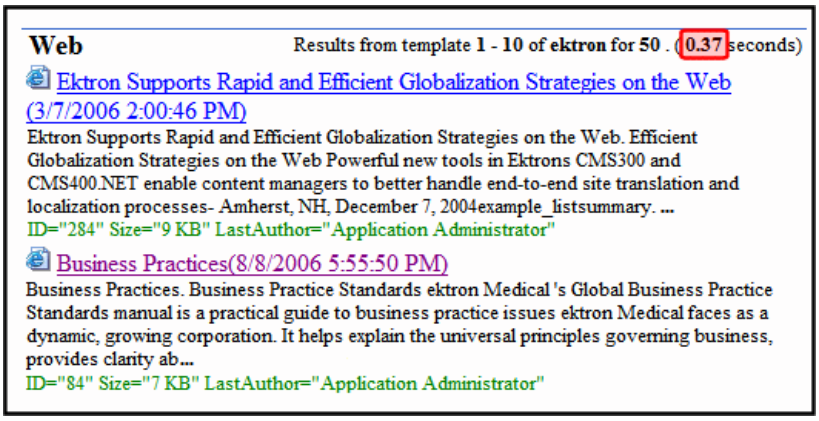
```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. <a href="[$QuickLink]">Click Here For Item #[$Index]</a>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$SearchDuration]

Displays the amount of time, in seconds, it has taken to perform the search.

This variable is typically used in the following context:

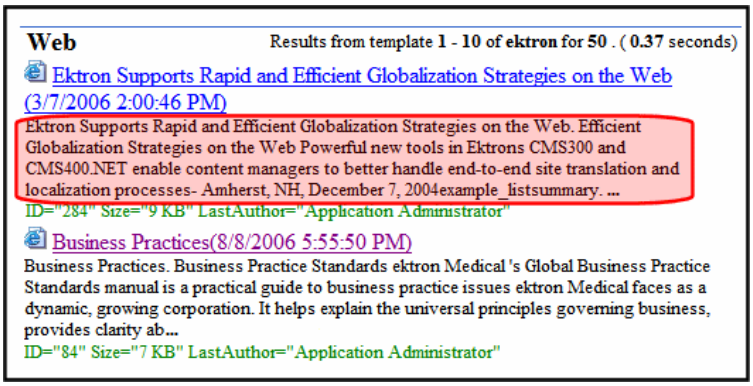
Results `[$PagingCurrentStartIndex]`.`[$PagingCurrentEndIndex]` of `[$ItemCount]` for item `[$SearchText]` (**`[$SearchDuration]`**).



[$SearchSummary]

Gets the first 300 characters from the body content and creates an abstract.

For content items that do not get indexed, such as images, the SearchSummary uses the image's title, summary, and metadata information.

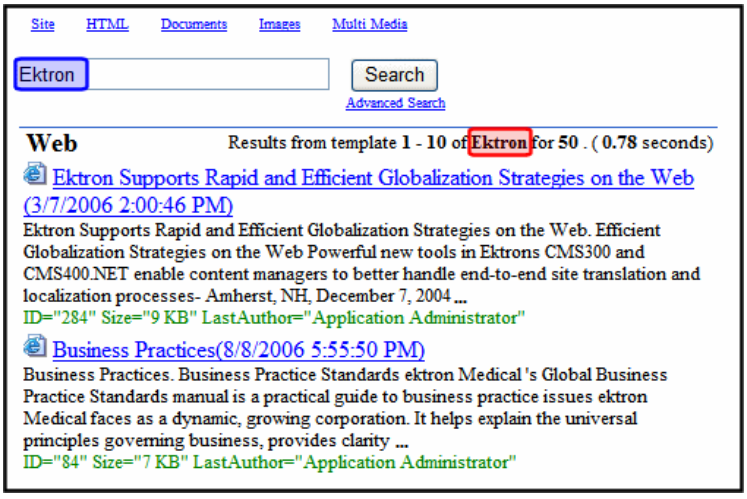


[$SearchText]

Displays the text for which a user is searching. This information is same as what a user entered in the search text box.

This variable is typically used in the following context:

Results `[$PagingCurrentStartIndex]`.`[$PagingCurrentEndIndex]` of `[$ItemCount]` for item **`[$SearchText]`** `([$SearchDuration])`.

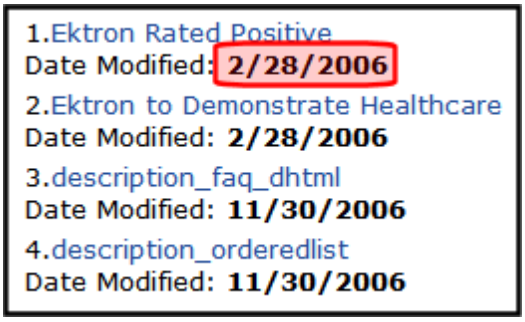


[$SERVER_NAME]

Displays the server name for the page on which this variable appears. For example, If this variable is applied to `http://www.example.com/demo.aspx`, the return is `www.example.com`.

[$ShortDateModified]

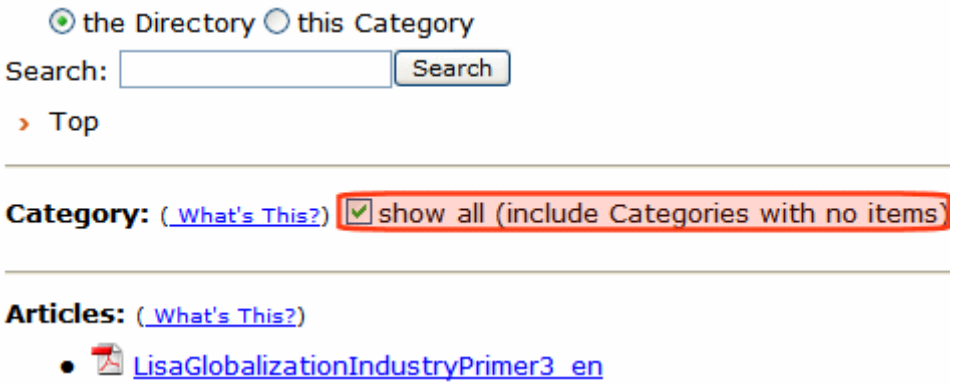
Displays the date the content was last modified. The variable show the date only. To show the Date and Time, use the *[$DateModified]* on page 2660 variable.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
        [$Index]. [$HyperLink] <br/>Date Modified: <b>[$ShortDateModified]</b>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$ShowAllcategory]

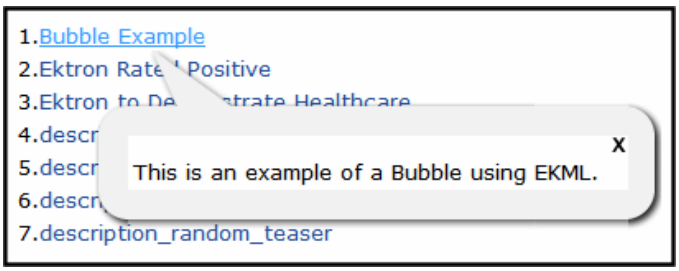
If a Directory server control's `EnableSearch` property is set to `true`, this variable adds the checkbox circled below to the right of the search field.



By default, the Directory server control only shows categories to which at least one content block is assigned. If you check this box, all categories appear, even those with no content assigned.

[$ShowBubble]

Calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble. This bubble is typically assigned to the `onclick` or `onmouseover` attribute in an `<a href="">` tag. See the following example EkML code.



```
<ekmarkup>
  <ekbubbleinfo>
    <table border="0">
      <tr>
        <td>[$Html]</td>
      </tr>
    </table>
  </ekbubbleinfo>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
            [$Index].<a href="#" onmouseover="[$ShowBubble]">[$Title]</a>
          </td>
        </tr>
      </ekrepeat>
    </table>
```

```
  </ekoutput>
</ekmarkup>
```

[$ShowBubble(width,height)]

This is similar to `[$ShowBubble]`. It calls the `<ekbubbleinfo>` tags and places the information contained within those tags in a pop-up bubble. This variable lets you set the width and height of the bubble. For example, `[$ShowBubble(300,400)`. In this example, the first number represents the width. The second number represents the height.

If you enter a single number, it sets the width. The height of the bubble is then limited to the length of the content. For example, if you had a video that was formatted at 200 pixels wide and you wanted to launch it in a bubble, you would add the function as `[$ShowBubble(200)]`.

The minimum width for a bubble is 287. The minimum height is 101.

```
<ekmarkup>
  <ekbubbleinfo>
    <table border="0">
      <tr>
        <td>[$Html]</td>
      </tr>
    </table>
  </ekbubbleinfo>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
           [$Index].<a href="#" onmouseover="[$ShowBubble(200)]">[$Title]</a>
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$ShowContent('htmltagid')]

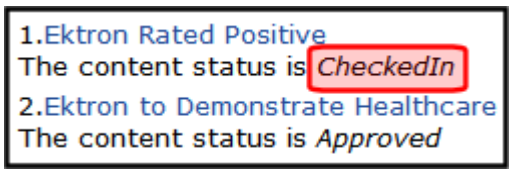
Calls the `<ekcontentinfo>` tags and places the information contained within those tags in the specified HTML tag ID. Replace the htmltagid with the ID of the tag. This tag is typically assigned to the `onclick` or `onmouseover` attribute in an `<a href="">` tag. See the example EkML code below.

```
<ekmarkup>
  <ekcontentinfo>
    <table border="0">
      <tr>
        <td>[$Html]</td>
      </tr>
    </table>
  </ekcontentinfo>
  <ekoutput>
```

```
    <table width="100%"  border="0">
      <ekrepeat>
        <tr>
          <td>
   [$Index].<a href="#" onmouseover="[$ShowContent('contarea')]">[$Title]</a>
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$Status]

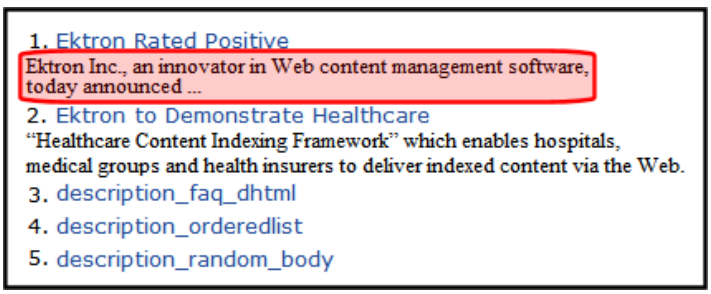
Displays the status of a content item. For example, Approved, Checked in, or Submitted for Approval. See also: Content Statuses.



```
<ekmarkup>
  <ekoutput>
   <table width="100%"  border="0">
    <ekrepeat>
      <tr>
       <td>
         [$Index]. [$Hyperlink]
          The content status is <i>[$Status]</i>
       </td>
      </tr>
    </ekrepeat>
   </table>
  </ekoutput>
</ekmarkup>
```

[$Teaser]

Displays the content item's summary information. A code example appears below.



```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
```

```
      <tr>
        <td>
          [$Index]. [$HyperLink] <br/> [$Teaser]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$TemplateQuickLink]

Displays the Template Quicklink information assigned to the taxonomy item in the Workarea. When wrapped in an `<a href="">` tag, you can create a Hyperlink.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
         <a href="[$TemplateQuickLink]">[Title]</a><br/>[$Teaser]
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$Title]

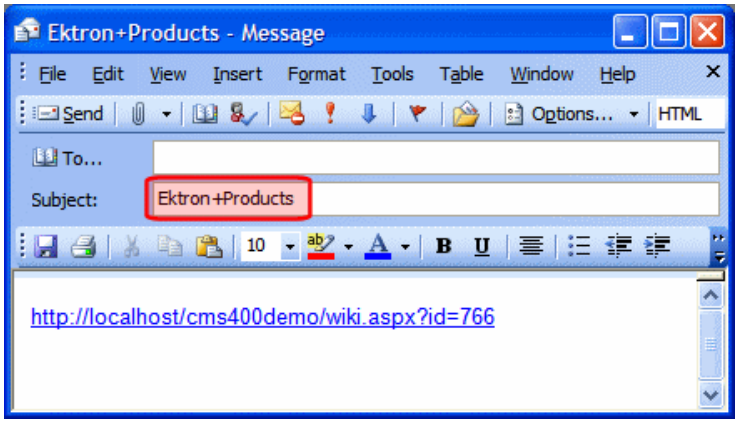
Displays the content item's title. Use this variable if you want to display the title as normal text. If you want to display the title as a hyperlink, use `[$HyperLink]`. See also: *[$HyperLink]* on page 2666. If you want to create a custom hyperlink with the title as the text of the hyperlink, use this property in conjunction with the `<a href="">` tag and the `[$QuickLink]` variable. See also: *[$QuickLink]* on page 2672.

```
<ekmarkup>
  <ekoutput>
    <table width="100%"  border="0">
      <ekrepeat>
      <tr>
        <td>
          [$Index]. <a href="[$QuickLink]">[$Title]</a>
        </td>
      </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$UrlEncode('str')]

Encodes the string information in the variable. This variable can be used to encode another EkML variable and place it in an email. For example, You want the title of the

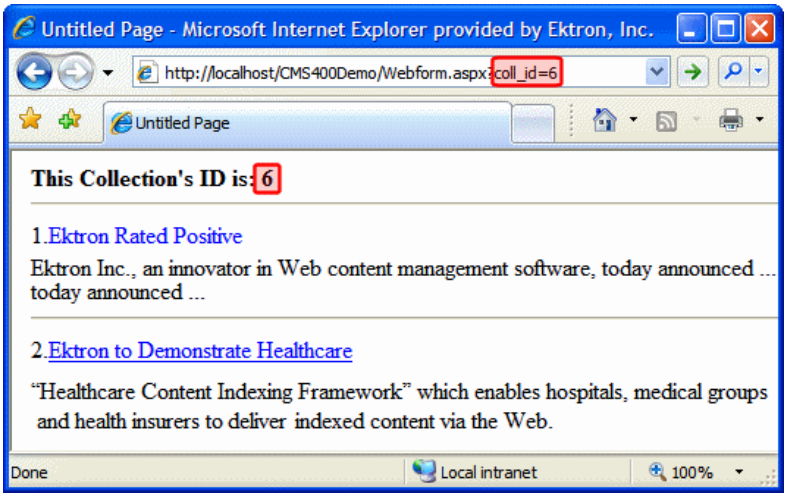
content block to appear as the subject of an email. A code example appears below.



```
<ekcontentinfo>
    <table border="0">
      <tr>
        <td>
          <strong>Title: </strong>
          <span style="color:red;">[$Title]</span>
          <a href="mailto:?subject=[$UrlEncode('[$Title]')]&body=
            http://[$SERVER_NAME]/CMS400Developer/wiki.aspx?id=
            [$ContentId]"> 
            <img src="WorkArea/images/application/icon_email.png"
              align="absmiddle" alt="[$Title]" border="0"/></a>
          <hr />
        </td>
      </tr>
      <tr>
        <td>[$Html]</td>
      </tr>
    </table>
  </ekcontentinfo>
```

[$UrlParam('paramname')]

Displays the value of a query string's parameter. For example, if you have a collection and want to display its ID, add the `[$UrlParam('coll_id')]` where you want the collection's ID to appear.



```
<ekmarkup>
  <ekbubbleinfo>
    <table border="0">
      <tr>
        <td>[$Html]</td>
      </tr>
    </table>
  </ekbubbleinfo>
  <ekoutput>
    <table width="100%"  border="0">
    <tr>
      <td>
        <b>This Collection's ID is: [$UrlParam('coll_id')]</b>
        <br/><hr/>
      </td>
    </tr>
      <ekrepeat>
        <tr>
          <td>
      [$Index].<a href="#" onclick="[$ShowBubble]">[$Title]</a>[$Teaser]<hr/>
          </td>
        </tr>
      </ekrepeat>
    </table>
  </ekoutput>
</ekmarkup>
```

[$UserName]

Display the Username of a user who left a comment on a message board.

```
<ekoutput>
    <div class="ContributionForm">
      <h4>[$NumberComments] Comments</h4>
      <ul>
        <ekrepeat>
          <li class="ekMessagePost">
            <div class="avatar">[$Avatar]</div>
            <div class="message">
              <div class="metaData">
                <span class="username">[$UserName]</span>
                <span class="time">[$DateCreated]</span>
              </div>
              <p>[$MessageText]</p>
              <ul class="commands">
                <li class="ekDeleteMessage">[$DeleteMessageLink]</li>
                <li class="ekApproveMessage">[$ApproveMessageLink]</li>
              </ul>
            </div>
          </li>
        </ekrepeat>
      </ul>
      [$AddCommentBox]
    </div>
  </ekoutput>
```
